This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

of Congress. All rights reserved.

STILLÉ & MAISCH'S DISPENSATORY—Second Edition—Now Ready.

THE NATIONAL DISPENSATORY:

CONTAINING THE NATURAL HISTORY, CHEMISTRY, PHARMACY, ACTIONS AND USES OF MEDICINES, INCLUDING THOSE RECOGNIZED IN THE PHARMACOPŒIAS OF THE UNITED STATES, GREAT BRITAIN, AND GERMANY, WITH NUMEROUS REFERENCES TO THE FRENCH CODEX.

SECOND EDITION, THOROUGHLY REVISED, WITH NUMEROUS ADDITIONS.

By ALFRED STILLÉ, M.D., LL.D.,
Prof. of Theory and Practice of Med. and of Clinical Med. in the Univ. of Pennsylvania, etc.
AND
JOHN M. MAISCH, Ph.D.,
Prof. of Mat. Med. and Bot. in the Phil. College of Pharm., Secretary to the Am. Pharm Association.

In one very handsome octavo volume of sixteen hundred and ninety two closely printed pages, with two hundred and thirty-nine illustrations; extra cloth, $6 75; *leather, raised bands,* $7 50.

FROM THE PREFACE TO THE SECOND EDITION.

The demand which has exhausted in a few months an unusually large edition of the NATIONAL DISPENSATORY is doubly gratifying to the authors, as showing that they were correct in thinking that the want of such a work was felt by the medical and pharmaceutical professions, and that their efforts to supply that want have been acceptable. This appreciation of their labors has stimulated them in the revision to render the volume more worthy of the very marked favor with which it has been received. The first edition of a work of such magnitude must necessarily be more or less imperfect; and though but little that is new and important has been brought to light in the short interval since its publication, yet the length of time during which it was passing through the press rendered the earlier portions more in arrears than the later. The opportunity for a revision has enabled the authors to scrutinize the work as a whole, and to introduce alterations and additions wherever there has seemed to be occasion for improvement or greater completeness. The principal changes to be noted are the introduction of several drugs under separate headings, and of a large number of drugs, chemicals, and pharmaceutical preparations classified as allied drugs and preparations under the heading of more important or better known articles; these additions comprise in part nearly the entire German Pharmacopœia and numerous articles from the French Codex. All new investigations which came to the authors' notice up to the time of publication have received due consideration.

This evidence of success, seldom paralleled, shows clearly how well the authors have met the existing needs of the pharmaceutical and medical professions. Gratifying as it must be to them, they have embraced the opportunity offered for a thorough revision of the whole work, striving to embrace within it all that might have been omitted in the former edition, and all that has newly appeared of sufficient importance during the time of its collaboration, and the short interval elapsed since the previous publication. After having gone carefully through the volume we must admit that the authors have labored faithfully, and with success, in maintaining the high character of their work as a compendium meeting the requirements of the day, to which one can safely turn in quest of the latest information concerning everything worthy of notice in connection with Pharmacy, Materia Medica, and Therapeutics.—*Am. Jour. of Pharmacy,* Nov. 1879.

This is a great work by two of the ablest writers on materia medica in America. The authors have produced a work which, for accuracy and comprehensiveness is unsurpassed by any work on the subject. There is no book in the English language which contains so much valuable information on the various articles of the materia medica. The work has cost the authors years of laborious study, but they have succeeded in producing a dispensatory which is not only *national,* but will be a lasting memorial of the learning and ability of the authors who produced it.—*Edinburgh Medical Journal,* Nov. 1879.

It is with great pleasure that we announce to our readers the appearance of a *second* edition of the National Dispensatory. The total exhaustion of the first edition in the short space of six months, is a sufficient testimony to the value placed upon the work by the profession. It appears that the rapid sale of the first edition must have induced both the editors and the publisher to make preparations for a new edition immediately after the first had been issued, for we find a large amount of new matter added and a good deal of the previous text altered and improved, which proves that the authors do not intend to let the grass grow under their feet, but to keep the work up to the time.—*New Remedies,* Nov. 1879.

The first edition of this great work appeared only a few months ago, and that the publishers should find it necessary to issue a second edition in the same year, is most conclusive evidence that this work has really supplied a want felt by the medical and pharmaceutical profession. The material embodied in the work is truly immense, as shown by the almost countless number of subjects treated. It is now, undoubtedly, the most perfect book of its kind in any language.—*Buffalo Med. and Surgical Journal,* Nov. 1879.

The fact that a large edition of this work was sold within a few months after its issue is, after all, the best encomium it could have, as showing that there was a demand in the medical and pharmaceutical professions for such a work. Altogether the work now seems to be as nearly perfect as possible; although objectionably large, it is difficult to conceive how it could be made smaller without greatly deteriorating its value.—*The Chicago Pharmacist and Chemist,* Nov. 1879.

The demand which in so few months has exhausted a large edition proves its acceptability to the medical and pharmaceutical professions. All recent investigations have also received due consideration. The new matter in the text amounts to about one hundred pages.—*Cincinnati Lancet and Clinic,* Oct. 1879.

A very important and comprehensive book, of indeed encyclopædic character. It is admirable from a pharmaceutical point of view and as a guide to the botanical, physical, and chemical character of the substances treated.—*British Med. Journal,* Oct. 1879.

To the profession at large, then, we will appeal when we say that the Messrs. Churchills have done a public service in introducing this book to English readers. As far as we can see on that perusal which can alone be given to books which are only intended to be books of reference, we should say that this was probably the most perfect book of its kind now available. It is emphatically, we would repeat, a book for the practitioner, one well calculated to give him hints as to treatment, and most suggestive as to remedies. It would be difficult for us to say more.—*London Medical Times and Gazette,* July 12, 1879.

CLINICS.

Clinical Lectures.

ON VALVULAR LESIONS OF THE HEART, CONSIDERED IN RELATION TO PROGNOSIS AND TREATMENT.

A CLINICAL LECTURE DELIVERED AT THE BELLEVUE HOSPITAL, NEW YORK.

BY AUSTIN FLINT, M.D.,

Professor of the Principles and Practice of Medicine in the Bellevue Hospital Medical College.

GENTLEMEN: I shall introduce two patients having valvular lesions of the heart, and, after stating the important clinical facts which the cases illustrate, I shall ask your attention to some practical remarks on valvular lesions.

This man's name is Andrew R. He is 47 years of age, and he is a blacksmith. His family history is unimportant. Prior to his present illness he always had good health. He was a strong, robust man. He has never had syphilis, nor rheumatism, nor any important pulmonary disease. He has been a moderate drinker. Six years ago he began to suffer, at times, from dizziness and palpitation. Coincident with these symptoms he passed blood with the urine. From that time to this, he has had repeatedly recurring attacks of hæmaturia, the amount of hemorrhage being sometimes considerable, and attended with obstruction to the free passage of urine. The attacks have been of short duration, and, in the intervals, he has been free from any urinary difficulty. The last attack was three weeks ago, just before his admission into hospital. He has an anæmic facies, and there is some œdema of the lower limbs and face. The apex beat of the heart is feeble, and felt in the fifth intercostal space just within the *linea mammalis*. There is a mitral systolic murmur, not transmitted much to the left of the apex. A systolic murmur is heard at the base, and the same murmur is heard over the carotids. There is also a feeble aortic regurgitant murmur. The aortic second sound is not weak, but the pulmonic second sound has greater intensity. The area of præcordial dulness on percussion is slightly increased.

I shall not consider the pathological significance of the hæmaturia in this case, except to say that it is true hæmaturia and not hæmatinuria, for the blood coagulates after its emission; that the long period since the first attack occurred renders the existence of malignant disease improbable, and that examinations of the urine now give no evidence of disease of either the bladder or the kidneys. I will add that one of my surgical colleagues, who has explored the bladder, is led to suspect papilloma within that organ. The hemorrhages have doubtless contributed to the anæmia.

I desire to call attention especially to the heart. We have the evidence of valvular lesions, both mitral and aortic. Moreover, there is some cardiac enlargement. Now what has the heart to do with the dropsy and the general condition of this patient? Very little, if anything. It would be a mistake to treat the patient as if the cardiac affection were the objective point, and prescribe digitalis, which, by the way, I apprehend is too often prescribed, as a matter of course, if there be any disease of the heart. It would be a mistake to give diuretics or hydrogogues to get rid of the dropsy, which is not enough to occasion any inconvenience. The desirable end is the building up of the patient. He needs good alimentation, digestion, assimilation, and nutrition. If we can succeed in giving to this patient good blood and improving his general health, I venture to predict that, for the present at least, his cardiac lesions will give him little or no trouble.

The name of the other patient is Mary A. C. She is 45 years of age. She is married, and has two healthy children. Her parents are both dead, but she does not know of what diseases they died.

Fifteen years ago she had acute articular rheumatism, and she had another attack six months ago. Since the last attack she has suffered from dyspnœa, with cough, some pain in the præcordial region, and a sense of constriction in the chest. Her appearance is anæmic. She suffers from dyspnœa on any exertion, and is sometimes obliged to get up at night. The apex-beat of the heart is in the sixth intercostal space two inches without the *linea mammalis*. The præcordial dulness is considerably extended, and increased in degree. The impulse of the heart is weak. At the apex there is a presystolic together with a systolic murmur, the latter transmitted into the axillary region and heard on the back. There is also a systolic murmur at the base, and this is heard over the carotids. The pulmonic is notably louder than the aortic second sound.

We have in this case mitral and aortic valvular lesions with considerable enlargement of the heart. General dropsy is wanting; but the patient has grave and, of course, incurable cardiac disease. Now, aside from this disease, she is anæmic and feeble. Perhaps her general condition can be improved by tonic remedies, good alimentation, etc. If this can be done, she may suffer comparatively little from the cardiac disease. The important object of treatment in this case is to improve to the utmost the general condition, in order thereby to secure the best possible tolerance of a disease which must necessarily continue.

Taking these two cases as a text, I shall devote the remainder of this lecture to some considerations relating to the diagnosis and treatment of valvular lesions.

The recognition of valvular lesions and their localization at one or more of the valves or orifices of the heart, have been brought to such precision by the study of the cardiac murmurs, as apparently to leave nothing to be desired further in these points of view. Important as are the advantages of this precision of physical diagnosis, it has not been without some disadvantages in relation to prognosis and treatment. Let me point out certain evils which may proceed from an accurate knowledge of the existence and seat of valvular lesions.

Nearly twenty years ago I was consulted by a physician from one of the Southern States. He had recently graduated in Philadelphia. Before leaving Philadelphia, he was led to ask the late Dr. Gerhard to examine his chest, some of his relatives having died with phthisis. Dr. Gerhard pronounced his chest free from any signs of pulmonary disease, but told him that he had a heart-murmur. Prior to this time, he had never had any symptoms pointing to cardiac trouble. The idea of the murmur worried him, and directed his attention to the heart. Some time afterward he was conscious of a little disturbance of the heart's action, and he went to Philadelphia for another physical examination. He was then examined by the late Dr. Pepper, who told him that there was a murmur, but no other evidence of any affection of the heart. He was comforted by Dr. Pepper's assurances, but was unable to dispel altogether his apprehensions. Under these circumstances he requested me to examine the heart. I found a systolic murmur within a limited area at the apex. The heart was not enlarged. Its action was regular. The pulmonic and aortic valvular sounds were normal. I assured him that there was no present occasion for anxiety, and advised him to try to forget that he had a cardiac murmur. He adopted my advice. He has ever since been engaged actively in medical practice. No symptoms of disease of the heart have occurred. During the last summer he called upon me, and I examined the heart. I failed to discover any murmur, and in all respects the organ was normal.

I cite this case as a striking one, among a considerable number of analogous cases, teaching the same lesson. The lesson is, that a cardiac murmur undoubtedly organic, that is, not hæmic nor extra cardiac, may represent a lesion which, for the nonce, is innocuous, and may never become otherwise. Now, what evil consequences may follow the discovery of such a murmur? A patient is told that there is the evidence of something wrong in the heart. In common parlance, he has "heart disease." In the popular mind this means always something grave, and is generally considered as involving more or less danger of sudden death. Let it be supposed that the physician enjoins extreme care in regard to physical exercise and mental excitement, advising perhaps the relinquishment of the pursuit in which the patient is engaged; impressing the importance of complete inactivity. It can easily be imagined how much anxiety is produced, and that the duties and aims of life may be sacrificed to needless precautions. These consequences are not imaginary; they have been exemplified in not a few instances which have fallen under my observation. In the instances referred to, it would have been better for the patients had a stethoscope never been applied to the chest. So great in some instances have been the evils following the discovery of an organic murmur, that ignorance of its existence would have been comparatively blissful.

How are such evils to be avoided? By acting in accordance with the following wholesome medical maxims: Positive, proximate evils are not to be incurred in view of remote, doubtful contingencies. A patient is always entitled to a prognosis as encouraging as is consistent with the most hopeful aspect of the case. I will endeavour to illustrate the application of these maxims by a hypothetical case. A physician examines the chest of a patient who has no symptoms of cardiac disease; following the rule that the examination should always enter into a thorough investigation of a case, or, perhaps, because the patient wishes to be assured that he is sound, a cardiac murmur is recognized, and the conclusion is reached that it is not an inorganic murmur. The organ is not enlarged. The impulse and the characters of the first sound show that its muscular power is normal. The aortic and the pulmonic second sound have a proper relative intensity. Under these circumstances, the murmur represents a lesion of some kind, it is true, but one which, for the time being is innocuous. The lesion may, or may not, at a future time, lead to hypertrophy and dilatation. These results, if they ensue, will probably give no manifestations until after the lapse of many years. Acting in accordance with the maxims just stated, the physician need not volunteer any statement respecting the murmur. If the question whether there be anything wrong be asked, a truthful answer must, of course, be given; but the statement should be accompanied by such explanations and assurances as will preclude the idea of the existence of any important disease, or the expectation of its development in the future. The patient is to be spared apprehensions which, of course, are gratuitous if the lesion remains permanently innocuous. Moreover, if hypertrophy and dilatation follow, at a period more or less remote, apprehensions will not prevent these results, and may even tend to promote them. And, in this connection, let me state a fact, already implied, which underlies the prognosis and treatment whenever the existence of valvular lesions is ascertained: The remote pathological results proceed, not directly from the valvular lesions, but from the hypertrophy and dilatation which they induce, and chiefly from the latter of these two varieties of enlargement of the heart.

In the case which I sketched of the physician, a mitral systolic murmur represented an innocuous lesion. The murmur in that case was not a regurgitant murmur, although systolic. Here is an important distinction which may often be made clinically. A systolic murmur, having its maximum of intensity near the apex, propagated a greater or less distance in a lateral direction to the left, and heard on the back near the lower angle of the scapula, is evidence of mitral insufficiency. But, if limited to a space at the apex, it has not that significance; it may be due to an intraventricular lesion, the competency of the valve not being impaired, and, consequently, no regurgital current taking place. My colleague, Prof. Janeway, has demonstrated that a small tendinous cord attached to opposite points of the inner walls of the left ventricle—a congenital abnormity—may cause an intra-ventricular systolic murmur. But a truly regurgitant mitral murmur does not necessarily represent a lesion of present importance. An insufficiency so small as to allow a regurgitant stream no larger than a knitting needle, may give rise to a murmur, loud, propagated to the left, and heard on the back. Such a lesion occasions no appreciable disturbance, and it may never increase. Practically it is, and may remain indefinitely, innocuous. And here let me remark that a practical precept is never to draw any inference concerning the amount of lesion from the intensity of a murmur. It is perhaps true, as a rule, that the smaller the amount of regurgitation, the louder the regurgitant murmur.

What is true of mitral lesions is equally true of those seated at the other orifices. An aortic direct murmur which, from its persistence and other circumstances, is not of hæmic origin, whether feeble or intense, may represent only a patch of atheroma or calcification causing no pathological effects, and remaining innocuous indefinitely. A little insufficiency of the aortic valve may have no greater importance than that of a mitral lesion causing a small regurgitant current. That an aortic regurgitant murmur may persist many years without enlargement of the heart, and giving rise to no appreciable cardiac symptoms, I know from cases which have been for a long time under my observation. As much can be said sometimes of a mitral direct or obstructive murmur; but I shall presently speak of the remarkable tolerance of the lesions giving rise to this murmur.

The practical points which I wish to make are these: Valvular lesions represented by murmurs, if there be no enlargement of the heart, are not of immediate pathological importance, and they may never become important. If the knowledge of their existence can be properly withheld from patients, it had better not be communicated. By no means terrorize them with the idea that they are doomed to die of "heart disease." Do not enjoin any radical changes in life, provided their habits are not inconsistent with hygienic laws. Above all, forbear any efforts to remove the lesions by mercury, the iodide of potassium, or other remedies. This last injunction may seem to many superfluous; yet it has happened that within a few days I have received a letter from a medical practitioner, detailing a case of a valvular murmur with no enlargement, the object of the letter being to inquire as to the propriety of other treatment than by large doses of the iodide of potassium which the patient was taking. In short, reverting to the maxims which I have laid down, avoid destroying the happiness and usefulness of a life in view of possible remote contingencies; allow all the benefit of a prognosis based on the fact that an innocuous lesion may remain so indefinitely, and may never become otherwise.

I proceed next to offer remarks on valvular lesions which have led to more or less enlargement of the heart. Errors in relation to prognosis and treatment may arise, in the first place, from attributing cardiac symptoms dependent on a functional affection associated with, but not dependent on, lesions, wholly to the latter; in the second place, from a deficient appreciation of other morbid conditions in accidental association, to which are measurably due the supposed effects of the cardiac lesions; and, in the third place, from an under estimate of the ability to tolerate these lesions.

It happens not infrequently that a patient with valvular lesions and more or less enlargement, who experiences little or no inconvenience therefrom, becomes affected with functional disorder from the same causes which produce it when the heart is sound, namely, dyspepsia, anæmia, the abuse of tobacco, excesses in venery, and prolonged mental worry. The functional disorder is independent of the organic affections, although, doubtless, more distressing in proportion as the heart is damaged by the latter. Now the palpitations, irregularity of rhythm, and intermissions, in some cases so excessive as to render significant Bouillaud's expression, *folie de cœur*, may be attributed wholly to the organic affections; hence, an exaggerated estimate of the importance or gravity of these. The physician may be taken by surprise, and astonished by the disappearance of symptoms which seemed to be alarming, and an apparent recovery of the patient. Many years ago I saw in consultation a young man who had unmistakably a valvular lesion, and there was such an amount of disturbance of the heart's action that a most unfavourable prognosis was given. Some months afterward the attending physician sent him to report to me. He considered himself well, and was actively engaged in some mechanical employment. He had a lesion which gave him no inconvenience, and the symptoms on which were based the unfavourable prognosis were functional, not dependent on the organic affection. I am free to say that I could cite other analogous instances of error in prognosis from my own experience.

If valvular lesions be associated with little or no enlargement, coexisting disturbances of the heart's action are to be considered as functional, and especially if the causative agencies of the latter be discoverable. But when the associated enlargement is considerable, it is by no means always easy to determine to what extent the cardiac symptoms are due to a functional disorder which is independent of the organic affections. This point is often only to be settled by the removal of existing causes of functional disorder, and appropriate treatment in other respects. A large clinical experience is of much use in forming a judgment on this point, before it is settled by time. As bearing thereon, the persistence and the effects of a purely functional disorder, that is, not associated with any lesion, in some cases, are to be considered. The following is a sketch of a striking illustration which came under my observation about two years ago. The patient, a lady in the neighborhood of forty years of age, had long suffered from dyspeptic ailments, and frequently recurring attacks of functional disorder of the heart. At the time to which I refer, the organ was in a state of persistent palpitation for several successive weeks. The pulse was thready, and extremely frequent, often exceeding 150 per minute. She became anasarcous, and the face had the pallor of death. It was difficult to realize that she was not in danger of dying at any moment. Yet, repeated examinations prior to this attack had shown that there was no enlargement, and there were no signs of valvular lesion. At length the functional disorder ceased, and she has since had comfortable health, although suffering at times from dyspepsia and paroxysms of palpitation.

By morbid conditions, other than functional disorder of the heart, accidentally associated with cardiac lesions, which are liable to give rise to error in diagnosis and treatment, I do not mean complicating affections as, for example, Bright's disease. The conditions especially referred to are impoverished blood, impaired nutrition, and general debility. A patient with obstructive or regurgitant lesions, or both combined, and the heart more or less hypertrophied, may scarcely be aware of any cardiac affection so long as alimentation is abundant, the digestion good, assimilation unaffected, the body well nourished, the nervous system undisturbed, and the muscular strength well maintained. Now, let it be supposed that this patient, from loss of appetite or any cause, ingests an insufficient supply of food; or that the digestive functions are impaired; or that either the assimilatory or digestive processes are defective; or that nervous prostration is induced by overwork or other causes; or that the muscular system is exhausted. Under these circumstances, singly or combined, distressing symptoms or effects of the cardiac affection are manifested. Dyspnœa and general dropsy, if the seat of the lesions be mitral, and præcordial oppression if the seat be aortic, are more or less marked. The error in prognosis is the belief that these symptoms and effects represent purely and simply the cardiac lesions, whereas they are measurably caused by co-operating morbid conditions accidentally associated therewith. The error in treatment is in directing measures exclusively to the heart. If the associated morbid conditions can be removed, the patient is restored to the comfortable state which existed prior to their occurrence. The object of treatment is the removal of these conditions.

Illustrations of the point which I am endeavouring to make clear, are frequent both in private and in hospital practice, more especially the latter. Over and over again I have presented in this amphitheatre, patients suffering from dyspnœa and general dropsy, and ventured to predict that, by appropriate treatment addressed not directly to the heart, but to associated morbid conditions, so much improvement might be hoped for that it would seem as if recovery from the cardiac affection had taken place. I could cite numerous cases in which this prediction was fulfilled. The grounds for such a prognosis are the existence of some, or perhaps all, of the conditions which have been named, and the degree of hypertrophic enlargement of the heart not being sufficient alone to account for the symptoms and effects.

I cannot leave this topic without commending it to your thoughtful consideration. Its importance as bearing on prognosis and treatment in cases of valvular lesions with enlargement of the heart, is very great.

Errors, in relation to prognosis and treatment, arising from an underestimate of the tolerance of cardiac lesions, are common, as a consequence of limited clinical experience. Giving preference to my own errors over those of others, I will cite the following illustration: A family to which, nearly thirty years ago, I stood in the relation of physician, consisted of a husband, a wife, and three daughters. All were healthy except one daughter, about fourteen years of age, who was attending school, and appeared less robust than her sisters, without being considered an invalid. On making an examination of her chest I was surprised to find a loud mitral regurgitant murmur, and considerable hypertrophic enlargement of the heart. Disease of the heart had not been suspected prior to this examination. I felt it my duty to tell the parents that they must not expect her to reach maturity, and that, probably, at farthest, she would live but a few years. Fortunately, perhaps, for her, they attached not much importance to my communication. She continued to go to school, and no restrictions of any kind were placed upon her. This girl developed into a delicate-looking woman, but with comfortable health, dying, with the usual symptoms of mitral lesions and dilatation of the heart, about twenty years after the date of my examination, surviving her father, mother, and one of her sisters. The error in this case was not in the diagnosis, but in the prognosis.

If valvular lesions with enlargement be unaccompanied by associated unfavourable morbid conditions, they are often well tolerated for a long period. To promote tolerance, the object of treatment is to maintain a maximum of general health. It is a great mistake to impoverish the blood, impair nutrition, and induce general debility by a restricted diet, and to enjoin complete mental and physical inactivity. A diet abundant and nutritious is a *sine qua non*. Restrictions should be determined only by the digestive capabilities. Muscular exercise, within a certain limit, is advisable from its influence on appetite, digestion, and nutrition. The proper limit is easily defined. It should not be so active as to occasion discomfort from either the action of the heart or dyspnœa. It should not be continued so as to produce exhaustion. Mental occupation, within the bounds of comfortable endurance, is useful as a hygienic measure, and as a preventive against introspection and brooding. It is, perhaps, not incorrect to say that practical errors in relation to the foregoing points in the treatment are not rare.

The situation and the character of valvular lesions are to be taken into account in prognosis and treatment. Aortic lesions which allow free regurgitation are the most doubtful in the way of prognosis. These lesions especially involve the liability to sudden death. They interfere with the nutrition of the left ventricle, inasmuch as the passage of blood into the coronary arteries takes place in the diastole, being effected by the recoil of the arterial coats; and the blood enters into these arteries with a force lessened in proportion as the aortic valves are insufficient. The danger of sudden death is greater without, than with, mitral insufficiency. The latter is to a certain extent protective against accumulation of blood in the left ventricle, and paralysis from distension. Weakness of the left ventricle from dilatation augments greatly the danger. These are points to be considered in the prognosis. As regards treatment, the object is to maintain the hypertrophy and muscular vigor of the left ventricle. Digitalis, given to the extent of diminishing the frequency of the heart's action, or, in other words, lengthening the pause after the two sounds, may increase the danger from over-filling of the ventricle.

Aortic obstruction is well tolerated. It is surprising how contracted the aortic orifice sometimes becomes before death takes place. This is better borne with, than without, mitral insufficiency. Regurgitation into the left auricle is compensatory and conservative.

Mitral regurgitant lesions, which are the most frequent in occurrence, may be tolerated indefinitely under favorable accompanying conditions. The case which I last cited exemplifies this statement.

Of mitral obstructive lesions I will speak at somewhat greater length. The murmur which represents these, namely, the mitral obstructive, or direct, or presystolic, has been recognized only within a few years. It was formerly confounded with the mitral regurgitant murmur, and is still by some who have given more or less attention to auscultation as applied to diseases of the heart. Not one of the cardiac murmurs is more readily recognized than this, when its distinctive characters are clearly apprehended. No other murmur occurs after the 2d sound and before the 1st sound, ending with the latter. Moreover, generally it has a peculiar vibratory or blubbering character, and it is limited to a circumscribed space around the apex of the heart.

This murmur represents mitral obstructive lesions, with an important exception, namely, when there is free aortic obstruction. I may claim priority in pointing out this exception, and in offering an adequate explanation of it. For the latter, I must refer you to my work on "Auscultation and Percussion," or my works on "Practical" and "Clinical Medicine." I may state here that this murmur is by no means so rare as I supposed when my clinical experience was more limited than at the present time. And it occurs oftener without mitral regurgitation than I formerly supposed. I have lately observed an interesting fact in regard to this murmur, namely, it may disappear after mitral obstruction has led to great dilatation of the left auricle. 'Under these circumstances, at different times, it may be present and absent. Its disappearance, of course, is of unfavourable omen, preceding or accompanying increase of dyspnœa and of general dropsy. When I first studied this murmur, I had the impression that it very rarely existed without a coexisting mitral regurgitant murmur. Experience has shown me that this impression was erroneous. In the majority of cases mitral obstruction is combined with mitral insufficiency, but the instances of the former without the latter are not infrequent.

Mitral obstruction, as represented by the presystolic murmur, may be tolerated indefinitely, and is not incompatible with comfortable health. Of a pretty large number of cases sustaining this statement, I will refer to a few.

Twelve years ago I saw a woman a few days after her confinement. She had orthopnœa, cyanosis, much anasarca, and a large dropsical effusion into both pleural cavities. There was a mitral direct murmur, with moderate enlargement of the heart. The physician who attended her in labor said the dyspnœa was such as to lead him to fear that she would die before the birth of her child. She was promptly relieved by the free operation of elaterium. She apparently regained good health. Meanwhile, I have seen her once, in consultation, with a moderate general dropsy. This was several years since, and I have lately heard of her as in comfortable health.

I have notes of two cases, both women, who were under my observation for more than ten years. In both the mitral obstruction did not interfere with comfortable health. In one case death at length took place, preceded by much suffering from dyspnœa and by general dropsy. In the other case, while the patient continued to suffer but little, and was accustomed to much activity, death was caused by gangrene of both lower limbs, probably due to embolism.

In another case which has been under my observation for ten years, the patient suffers but little inconvenience from symptoms referable to the heart, although the general health has been much impaired at times by malarial fever and by menorrhagia. In this case the mitral direct is associated with an aortic regurgitant murmur. During the ten years, very little, if any, enlargement of the heart has taken place.

I will next offer some remarks on the treatment in cases of mitral lesions (obstructive or regurgitant, or both combined) associated with dilatation of the heart, sufficient, exclusive of accessory morbid conditions, to give rise to dyspnœa, orthopnœa, and to general dropsy. Every practitioner of much experience is familiar with cases in which the patient is unable to lie down on account of distress from the sense of the want of breath, getting a certain amount of disturbed sleep by bending the body forward, raising the arms, and resting the head upon some support. There is anasarca, and the lower limbs, together with the scrotum and penis, become enormously swollen. There is more or less effusion within the peritoneal cavity and both pleural cavities. The suffering for days, weeks, and months, in this pitiable condition, is extreme. Death seldom comes in a shape more terrible than this. What can be done to diminish suffering and prolong life under these circumstances?

Efficient measures of treatment will often do much. The effect of active hydragogue purgation is sometimes marvellous. Physicians are often unduly timid in resorting to potential hydragogues for fear of exhaustion. The elimination of water by the intestinal canal, so far from exhausting the patient, gives increased strength by relieving the dropsy and the suffering from dyspnœa, thereby enabling the patient to have refreshing sleep. Elaterium, the king of hydragogues, may be judiciously given without apprehension. Podophyllin is a royal remedy, but less potent than elaterium. Of the inferior grade of hydragogues, the pulvis purgans should hold a high rank; but in my experience it has often proved unreliable, as I suspect from the poor quality of jalap dispensed by apothecaries. The Epsom salts is an old remedy which has fallen in a measure into unmerited disuse. It is easily administered, generally well borne and reliable. After relief has been procured by active hydragogue purgation, either a moderate drain from the bowels may be kept up, or the active purgation repeated once a week or fortnight, as circumstances may indicate. In the intervals, a diet as substantial as practicable, and tonic remedies, if indicated, are important, adopting the excellent maxim that "a lame heart needs good blood."

In the cases to which I now refer, digitalis is often an invaluable remedy. This remedy is indicated by weakness, rapidity and irregularity of the heart's action. I agree with those who regard this remedy as a cardiac tonic rather than a cardiac sedative. Its potency is sometimes extraordinary. It should be given for a short time, and then suspended, to be resumed, from time to time, according to the indications.

Pursuing the plan of treatment just outlined, I believe that I cannot be mistaken in the opinion that I have seen much mitigation of suffering and prolongation of life.

I will conclude this lecture by summarizing in a few aphorisms the practical points which I have presented.

1. Cardiac murmurs may represent lesions which, if unaccompanied by symptoms referable thereto, enlargement of the heart not coexisting, and the heart-sounds normal, are to be considered as innocuous. The prediction of grave consequences, under these circumstances, is unwarrantable, inasmuch as they may never occur. Such lesions do not claim medical treatment, nor any extraordinary precautions; and it is desirable that the fact of their existence be withheld from patients, if this can be done with propriety.

2. Patients with valvular lesions are liable to suffer from functional disorders of the heart, arising from causes which have no pathological connection with the lesions. It is highly important to recognize, clinically, this accidental coincidence, in order to exercise a correct judgment as to the prognosis and treatment.

3. Various morbid conditions, other than functional disorder of the heart, may be accidentally associated with valvular lesions and more or less cardiac enlargement. These associated morbid conditions may be, in a great measure, responsible for symptoms and effects which seem to denote an advanced stage of the cardiac disease, whereas, the latter may occasion but little inconvenience, provided these accessory, co-operating conditions can be removed.

4. Valvular lesions involving either obstruction or regurgitation, or both combined, and having led to considerable or even great enlargement of the heart, under favorable circumstances as regards associated morbid conditions, are often well tolerated indefinitely. There is less reason for a hopeful prognosis, in respect of tolerance, when there is considerable

aortic insufficiency, than in cases of aortic obstructive lesions, and those which occasion obstruction or regurgitation at the mitral orifice. The danger of sudden death from aortic regurgitation is lessened by coexisting mitral insufficiency.

5. In cases of orthopnœa and general dropsy dependent on mitral obstructive or regurgitant lesions and enlargement of the heart, digitalis and active hydrogogue purgation repeated from time to time, not only often afford notable relief, but there is reason to believe that life is sometimes thereby much prolonged.

ON THE THERAPEUTICS OF ACUTE RHEUMATISM.

A CLINICAL LECTURE DELIVERED AT THE JEFFERSON COLLEGE HOSPITAL.

By ROBERTS BARTHOLOW, M.D.,
Professor of Therapeutics and Materia Medica in Jefferson Medical College, Philadelphia.

Gentlemen: In no disease is the influence of fashion in therapeutics more conspicuous than in the treatment of acute rheumatism. Now it is a therapeutical nihilism, as the "mint-water method" at Guy's Hospital; again it is the application of blisters to the affected joints; now it is the alkaline treatment; again it is salicylic acid. Whatever it may be, the remedy has almost universal sway for a time, until supplanted by some other fashion. I need hardly say that we should not abandon an old and well-tried remedy for a new one, simply because it is new; but the new one should be distinctly better. It may be useful then, in view of the cases which have been before us, to examine into this subject of the therapeutics of acute rheumatism, and come to some conclusions, if we can, in regard to the relative merits of the various remedies which have occupied professional attention for several years past.

First of all, gentlemen, I cannot too strongly insist on this fundamental fact, that no single remedy can be rightly applied to every case of acute rheumatism. In this disease, notwithstanding it pursues a pretty uniform plan, there are wide differences in origin, in the type of individual cases, and in the constitutional state and bodily condition of patients—all of which must have due recognition if we would employ our therapeutical expedients wisely. Let me illustrate: Rheumatism seems sometimes to be of distinctly nervous origin. We now know that certain changes in the spinal cord, and injuries of nerves, are followed by joint inflammations similar to those of acute rheumatism. Again, the circulation of some organic acid in the blood has seemed to excite rheumatic inflammation; at least we know that the sweat and the urine are very acid, that endocarditis has been excited by injecting lactic acid into the peritoneal cavity of animals, and that rheumatic attacks have been induced by the administration of lactic acid for diabetes.

Furthermore, the most superficial inspection of the cases which have been shown must have satisfied you that there are three classes of subjects who are attacked by rheumatism: the cachectic, feeble, and nervous; the obese, florid but flabby, drinkers of malt liquors; the vigorous and able-bodied, who have inherited or acquired a rheumatismal diathesis.

These forms and types are so distinct that he who fails to take heed of them cannot properly adapt his means to the end in view, and must pursue merely routine methods.

We are greatly aided now in our attempts to arrive at just conclusions respecting the therapeutical value of our remedies for rheumatism by the exact knowledge we possess of the natural history of this disease. Thanks to the "mint-water treatment" of Guy's Hospital, we know that rheumatism has a tendency to get well about the fourteenth day, and again but more decidedly about the twenty-first day, but that it usually continues on to the sixth week and does not really cease earlier, as I think Dr. Fuller conclusively shows. The traditional "six weeks and blankets," under the spoliative treatment formerly employed, seems to be about the natural limit of rheumatism, and hence, if under our remedies the duration of the disease is distinctly less, they have exerted a curative influence. It is very apparent, therefore, that we have several remedies which possess curative value in this disease, for under their use the duration of it is materially abbreviated.

Taking up for consideration, first, the type of feeble, anæmic, nervous subject—what method shall we pursue? If I were governed merely by the fashion of the time I would direct salicylic acid or salicin—an undeniably efficient remedy in many cases. But in this class of subjects it does not succeed well; they are much depressed by it, and have a tedious convalescence with a strong tendency to relapses. In these cases I decidedly prefer the tincture of the chloride of iron, in half-drachm doses, well diluted with water. We owe chiefly to Dr. Russell Reynolds the important fact that the tincture of iron is an efficient remedy in acute rheumatism. It cuts short the duration of the disease, and what is even more important, lessens the danger of cardiac complications. Dr. Anstie pointed out another fact—that the tincture of iron has the power of prophylaxis—of preventing attacks that are impending. Whether it acts by virtue of its acid or its iron is not known, but it is probably the former. Dr. Ridge has shown that the mineral acids are decidedly curative in acute rheumatism. Alkalies are curative in rheumatism! mineral acids are curative in rheumatism! What strange contradiction is this? After all, gentlemen, this opposition of agents is more apparent than real. It is not difficult to conceive that whilst alkalies neutralize the acid of rheumatism, the mineral acids may prevent its formation. We may, therefore, assume that the virtues of the chloride of iron are due to its acid; but we should not obtain the same good results from chlorhydric acid, for iron aids in the restoration of the blood, and is useful for this reason.

I direct, as I have already indicated, and as you have witnessed, thirty minims of the tincture well diluted with water, every four hours. The affected joints are wrapped in cotton if the patient desire it, but otherwise are simply kept at rest, and if the pain is severe, some small blisters are applied around the joint, but not on it. I have treated many cases with the iron alone, and with iron aided by moderate doses of alkalies and blisters. The best results have been obtained in these weak and anæmic subjects by the iron and blisters, and an occasional laxative of Rochelle salt. The treatment by blisters alone is a highly efficient plan, and is by no means so painful and disagreeable as it appears at first sight. The blisters remarkably relieve the pain, and patients soon learn this and ask for their repetition. But the blisters do more—they bring about a more alkaline condition of the blood, and render the urine less acid or bring it to neutral, or even to alkaline. I do not, as the French physician (Dr.

Dechilly) who proposed the method, apply large blisters over the whole of the affected joints, but as Dr. Davies, of the London Hospital, who introduced the method into England, apply smaller blisters to encompass the joints. To be more explicit: I have small blisters, the size of a silver dollar, placed around the joint, leaving an interval between for succeeding applications.

In these weak subjects a few blisters are applied, and the joint is supported at rest, but the tincture of iron is the chief remedy. Managed in this way, the duration of the cases rarely exceeds two weeks; heart complications are infrequent, and the patient's strength is conserved so that convalescence is rapid and relapses uncommon.

The cases of the second class require different management. They are the fat and flabby subjects, often excessive consumers of malt liquors, who suffer habitually with acid indigestion and the usual concomitants of this state. Such subjects present a delusive appearance of good health, but they have a weak circulation, are easily put out of breath, tire on the least exertion, and often suffer from lumbago, myalgia, and other so-called rheumatic troubles. When attacked with acute rheumatism, they are very apt to have endo- or exo-cardial complications. These cases are most successfully treated by the alkaline plan. In, I believe, almost the last paper written by the late Dr. Fuller, which was in opposition to Drs. Gull and Sutton's "mint-water treatment," he insisted strongly on certain points in regard to the use of alkalies, inattention to which had been the cause of failure in the treatment. He says we must give not less than an ounce and a half of the alkaline carbonates, either alone or in combination with a vegetable acid, during the first twenty-four hours of the treatment. This may be prescribed as a drink—a lemonade—by adding lemon juice or citric acid to the solution of the carbonates—two drachms of the carbonates, an ounce of lemon juice, or half a drachm of citric acid dissolved in four ounces of water, and taken every three or four hours. If the bowels are constipated, he gives compound cathartic pills at bedtime. As soon as the urine, when passed, ceases to exhibit an acid reaction, he reduces the alkali one-half. This reduction of the daily quantity of alkali goes on each day, until the fourth or fifth day, when, if the urine continues to be alkaline, he prescribes bark preparations or quinia, at the same time continuing the alkalies in moderate quantity. If treated on this plan, the class of cases under consideration get well within two weeks, and are often up in a week. Instead of giving the quinia in the small doses of three grains advised by Dr. Fuller, the results are much better if twice that quantity is given every four hours. In these cases, instead of quinia I usually give, after the alkali course, the tincture of iron; and if the attack is a severe one, apply blisters about the principal joints.

The third group of cases consists of vigorous subjects having, in a considerable proportion of them, an inherited tendency. According to my experience, cases of this type are adapted to the action of salicylic acid, and are often relieved with remarkable promptitude by means of it. Salicin is probably nearly as effective, but it must needs be given in such quantity as to be difficult to manage. Scruple doses of salicylic acid seem to be sufficient for most cases of rheumatism, provided they are often enough repeated. The patient should receive not less than two drachms every twenty-four hours, and considerably more may be required. I have found that salicylic acid is more effective if given in solution or contemporaneously with an excess of alkali, than if administered in powder by itself. If kept for a few hours in solution with sodium bicarbonate in excess, the solution becomes brownish or greenish-brown, and emits an odour of wintergreen. Take it all in all, the most satisfactory procedure is to give wafers containing the salicylic acid, and alternate with an effervescing draught of an alkaline carbonate—the officinal effervescing powder answers the purpose. The amount of relief given by this remedy in many cases, is amazing, and in a few hours, a cure being effected not unfrequently in three or four days. When good is being accomplished by it, the evidence is quickly afforded in relief to pain and decline of temperature. If, therefore, after several days—three or four—persistent and efficient administration of salicylic acid, the signs of improvement are wanting, it is probable that nothing will be accomplished by its continued use. If the stomach will not bear it, or if the considerable doses necessary depress the action of the heart, or cause great irregularity in the pulsations, it must be discontinued.

Notwithstanding the importance of these remedies or methods of treatment, there are accessories scarcely inferior in the influence which they exert over the progress of the case. The diet must be carefully regulated. Solid food of any kind seems to be hurtful, and there is usually great repugnance to it. Milk, and beef, mutton, or chicken broth, are the chief components of the diet. Large draughts of milk are useful by maintaining free action of the kidneys. Coffee and tea may be allowed, but wine, beer, and spirits are highly injurious.

Shall any attention be given to the joints? Experience does not justify the local treatment of the rheumatic inflammation. The curative effects of blisters are not due to the notion at one time entertained, of the withdrawal of a morbific material from the affected parts, or to the counter-irritant action, but to their systemic effects in increasing the alkalinity of the blood, and lessening the acidity of the urine, and their power to relieve pain. Wrapping the joints in cotton is comforting to the patient, but it is questionable practice, as the heat is retained, and the temperature of the joints kept above that of the neighbouring parts. The application of alkaline lotions, at one time much used, owing to the theoretical notions then entertained, is now rarely employed. Painting with iodine tincture, does not influence the course of the case in any way. To maintain immobility of the affected joints, is a measure of the highest utility. Motion increases the pain and swelling, which react in turn on the systemic state, and conversely, an absolutely quiescent state of the joints, diminishes pain, and lessens fever. To secure the necessary quietude has been attempted by mechanical means—by starch or plaster bandages; but there are many joints so situated that this method, if desirable, would be impracticable. In fact, the desired immobility can be secured only by moral and medicinal means. The necessity for quiet—for absolute quiet—should be impressed on the patient, but moral suasion must be aided by means to quiet pain and restlessness. It is the sedative influence of the bromides on the centres of conscious impressions, and on the reflex and motor centres, which gives them importance as remedies in acute rheumatism, and by some of our best authorities they are assigned the highest place.

Relief to pain and restlessness is best afforded by the agents which exert a curative influence, but if pain persists relief must be given in some other way—by anodynes. If the bromides are active enough to allay pain, to bring sleep, and to quiet the restlessness, they are to be preferred; but it will generally be found, I think, that they do not possess sufficient anodyne power. Morphia or Dover's powder, are usually resorted to, but the relief which they afford is at the expense of a protracted convalescence. By checking elimination, opium retards improvement. There is an agent which happens to have a decided effect in relieving pain, whilst at the same time it promotes elimination; that is, atropia, which, for this purpose, was first used and recommended by Dr. Harley. It should be administered hypodermatically and in the neighborhood of the affected joints. The dose for each injection need rarely exceed the $\frac{1}{50}$ grain a day.

I have probably occupied sufficient time in giving this summary of the treatment of rheumatism, yet I ought to say something of important complications. It is by no means an unusual circumstance to have endo- or exo-cardial inflammations occur—in, probably, one-third of all the cases. To combat it, there are three remedies of chief value—morphia, ammonia, and digitalis. As soon as the fact of the cardiac complication having arisen is known, the carbonate of ammonia in solution of the acetate (5 grains to a tablespoonful), should be freely given, with the object of securing prompt solution of the fibrinous exudation or deposited fibrin. To check the inflammatory process, and lessen the work of the heart, morphia and digitalis are prescribed. The morphia is most efficient when administered hypodermatically, and the digitalis when in the form of infusion. As there is no therapeutical incompatibility, these agents may be given contemporaneously. When the acute symptoms subside, to relieve the immediate and prevent the ulterior bad effects of the inflammation, the tincture of iron and quinia should be given freely, and the heart should be kept steady by digitalis. The extent to which restoration of these injured parts, delicate in structure as they are, can be carried by rightly seconding the efforts of nature, is very surprising. Shall counter-irritants be used? Although we are told that a blister applied to the bony walls of the chest cannot affect the condition of organs within, yet experience is in favor of the practice, and the patient's subjective sensation of relief is more valuable testimony than the deductions of theory. Neither need we be concerned about the blistering point, but put on one not over the præcordia, to interfere with auscultation, but on the side of the chest, in the subaxillary space.

There is a complication of rheumatism—fortunately very rare—in which, without any apparent cause, the temperature suddenly leaps up to 106°, 108°, even 109° Fahr. This state of *hyperpyrexia*, as it is called, is accompanied by delirium and by cardiac and respiratory disturbances. That the grave symptoms of hyperpyrexia are due to the high temperature, is now admitted on all sides, but no adequate explanation has thus far been given of the causes producing it. We only know that in some cases, hyperpyrexia comes on, and paralysis of brain and heart quickly ensues if the excess of heat cannot be removed. Until the value of the cold bath had been made known, there existed no means of diminishing the extraordinary heat, and these cases were always fatal. Now, however, the cold bath affords us the means of rescuing some cases from impending death. The method of the application is the same as for fevers, but if the bath is not available, the wet-pack is a resource which can always be utilized.

Hospital Notes.

Cases of Stone in the Bladder; Lithotrity at one sitting; Remarks.

The following case which occurred at the Liverpool Royal Infirmary, under the care of Mr. **Reginald Harrison**, is noteworthy, chiefly because of the marked tendency to stone formation, the patient having previously been operated on twice by lithotomy and once by lithotrity. It further illustrates the practice recently advocated by Dr. Henry J. Bigelow, of Boston, under the name of "litholapaxy." (See *American Journal of the Medical Sciences*, January, 1878, p. 117.)

J. A——, a shop-keeper, aged sixty-three, was admitted on April 22, 1879. Eight years before he suffered from symptoms of stone, for which he was cut, and a calculus was removed. Within a year he was again cut at another hospital, and two calculi were successfully removed. During the year previous to admission a stone was removed by lithotrity, and at the commencement of the present year the old symptoms again returned. On admission he was suffering from frequent micturition, pain at the end of the penis, and occasional hæmaturia. The urine was purulent and deposited phosphates in abundance. On examining him under ether with a lithotrite, a round stone of about an inch in diameter was felt.

On April 25th, Mr. Harrison broke up the stone, which was phosphatic, and evacuated the débris after the manner practised by Professor Bigelow. The symptoms were at once relieved, and the cystitis from which the patient had so long suffered gradually abated under treatment. Though the calculus was most completely broken up, there were no signs of hemorrhage, either during the time of operation or afterwards. He left the infirmary on May 15, 1879, passing urine normally, and free from all signs of calculus.

After so extended an experience of stone and its treatment as this patient had undergone, it is not only interesting but proper to record his observation, "That the new plan was the easiest way he had had of getting rid of a stone."

In commenting upon this case Mr. Harrison said that it was another illustration in his own experience of the great value of litholapaxy in suitable cases. The object of this operation was to do away entirely with those ill effects which are produced by the retention and passing with urine of broken pieces of calculi, which by their angles inflict injury on the mucous membrane of the urinary passages with which they come in contact.—*Lancet*, Oct. 25, 1879.

In the same journal Mr. **Teevan** reports the case of a gentleman aged eighty-eight years, who many years previously passed two calculi, and who for a long time had occasionally suffered from pain in the loins, and had passed gravel. One year ago the gravel ceased to appear, now and then he saw a little blood in his urine, and he began to be troubled with frequent micturition, and dull aching pain in the perineum, which latterly increased, and his urine became thick and offensive. For the past three months he had been confined to his bed, got but little sleep, and was excitable and unmanageable.

On examination a hard stone was found in the bladder. As the urine gave no evidence of renal disease, an operation by Bigelow's method was determined upon. In twenty minutes an excessively hard lithic acid stone, measuring one inch and a quarter by one inch, was pulverized and evacuated. The patient's progress after the operation was one of gradual improvement. The highest temperature recorded was 101° on the second day. The urine began to clear on the fifth, and on the eleventh he left his bed, to which he had been confined for three months, and five days later he drove out. Three weeks after the operation he was free from pain and cheerful. He could hold his urine for four hours, and got a good night's rest. The urine was clear and there was no phosphatic deposit.

MONTHLY ABSTRACT.

Anatomy and Physiology.

Congenital Abnormal Development of the Extremities.

Herr **Wittelshöfer** has published a *résumé* of 46 cases of abnormal development of the extremities; two of these cases have come under his own personal observation. One of these two cases is that of a girl aged 14, who, from her birth, had presented an abnormal development of the third and fourth fingers of her left hand. Both fingers were united, and had reached such a size that it was found necessary to extirpate them. The length of the whole mass was 17 centimetres, its largest circumference 29 centimetres. The secretion of sweat was remarkably strong on the affected parts; the patient herself was very fat. The second case is that of a sickly boy, aged 11, whose lower left foot was hypertrophic, especially the third, fourth, and fifth toes, which formed a tumour of 38 centimetres circumference. This monstrosity occurs more frequently in the upper limbs (31 cases) than in the lower (22 cases); the right half of the body seems also to be more frequently affected than the left. The third finger or toe appears to be more liable to become hypertrophic than the other fingers or toes, but in most cases the neighbouring members become also affected. In 13 cases, the disease had remained restricted to one finger or toe alone; in 23 cases, to two; in 11 cases, to three. In 1 single case, the fifth toe had also become hypertrophic. In 3 cases, both hands were affected; in 1 case, both feet; in 2 cases, both extremities on the same side; in 1 case, the left upper and right lower extremity were hypertrophic. The disease never attacked more than two extremities of the same individual. Both extremities were not always symmetrically affected. It has been proved by careful measurement that in all cases of macrodactylia the whole extremity is enlarged. This affection appears to be congenital, but not hereditary. It is a curious fact that this affection is very frequently combined with syndactylia and abnormal development of the adipose tissue.—*London Med. Record*, Oct. 15, 1879.

Case of Double Vagina and Cervix Uteri.

Dr. **Wm. R. D. Blackwood**, of Philadelphia, reports (*Phila. Med. Times*, Oct. 25, 1879) a case of a virgin with double vagina and cervix. Each vagina was moderately capacious and presented no abnormal features. The cervix on the right side presented at an angle of about ten degrees, bending towards the right, and that of the left side made an angle of probably twenty degrees, pointing towards the left. Each cervix was normal in shape, size, and general characteristics, both canals patulous to the sound, but only so far as the os internum, beyond which, passage at this time was impossible with any justifiable force. Conjoined manipulation by both the rectal and abdominal parietes showed the uterus to be single, with double cervix. The body of the uterus was of the usual size, and was freely movable and not sensitive to pressure. The right cervical canal was subsequently dilated, and the sound passed to the fundus, the depth being two and a half inches; the left cervix was likewise dilated, and the sound measured two and three-quarter inches, the extra distance being attributable to the lengthening of the cervix. The uterus was found to be divided into two cavities by a complete vesical septum.

In the examination of the case the fact was elicited that the pain which accompanied menstruation was referred to the left side and was intensified at every second menstrual period. At the time of examination the period in progress was one in which the pain was not increased during the flow. On very careful speculum examination it became apparent that the flow was entirely confined to the right side of the uterus. The next day the examination was repeated, with precisely the same result, and, as the flow was much less abundant, the difficulty of keeping the parts clean was not so great as before. Similar results were obtained on the next day, the last of the period.

On the appearance of the catamenia at the next period the examination with the speculum was renewed. *The flow was now from the left cervix alone.* As before, care was had to exclude possible error, and during the three days ensuing the only difference observable was that the amount of discharge was less than had been observed from the right side, and some little pain was present during the first twenty-four hours. The present month has been the thirteenth since the inquiries began, and in these thirteen periods the regular alternation has been maintained, with a single exception—that in August, when the flow should have been *right-sided*, it was from the *left*, as in the month before.

Contributions to the Anatomy and Surgery of the Accessory Thyroid Gland.

MADELUNG has published (Langenbeck's *Arch. f. Klin. Chir.*, vol. xxiv. Heft 1, p. 71–107) a very able paper on accessory thyroid glands. The conclusions he has arrived at are as follows: Accessory glands are due to some fœtal malformation or abnormity. Analogies are frequently with the spleen, liver, prostatic gland, the ovaries, the pituitary gland, etc., where accessory glands are often found. He proposes to classify the accessory thyroid glands in five principal groups, according to the position they occupy with reference to the principal gland, viz., glandulæ thyroideæ accessoriæ, superiores, inferiores, laterales, anticæ et posticæ. The vessels which belong to these glands are for the greater part branches from the thyroid vessels; in very few cases they have been traced back to the crico-thyroid vessels. The structure of the accessory glands closely resembles that of the principal gland; they are mostly round or oval, though they may also be flat or bent like a hook, or have long slender processes. They vary in size from a pea to a French bean; the biggest have been found among the gland. thyr. access. superiores. The malformation is not hereditary, though it seems as if some nationalities had a greater tendency to it. They are found more frequently in women than in men, and on the right side of the thyroid gland than on the left, and are often mistaken for lymphoid glands. They are very apt to degenerate into cysts, but strumous degeneration is, on the whole, of rare occurrence. The diagnosis of the latter form of this affection is difficult. The following are the principal symptoms: It begins to develop about the age of puberty, on the right side of the throat in a female individual. It is very apt to change its place and become movable. In cases of retro-œsophageal strumata, the superior thyroid arteries form extensive anastomoses. There are also many local symptoms of pressure on the respiratory tract. The patients often suffer much, especially if the posterior or lateral accessory thyroid glands are affected. In some cases death has been caused by the compression of the œsophagus, the respiratory tracts, the impossibility of swallowing, etc., strictures of the trachea, and softening of the cartilages of the trachea and the larynx. The treatment recommended by the author consists in extirpation of the glands, or injections of iodine into the tissues. He has a very high opinion of the latter, and suggests that in cases where the accessory glands are situated between the œsophagus and the spinal column, the injections should take place from the pharynx. In cases of extreme danger, tracheotomy would be indicated. The growth may be extirpated either from the mouth, as Busch and Kocher have frequently done, or by making a long cut along the rectus capitis anterior, after the method adopted by Braum and Kocher.—*London Medical Record*, Oct. 15, 1879.

Materia Medica and Therapeutics.

Salicylate of Iron.

Dr. Walls White (*Glasgow Medical Journal*, Aug. 1879) prepares the salicylate of iron by dissolving together sulphate of iron twenty-four grains, salicylate of soda thirty grains, and acetate of soda twenty grains, in an ounce of water. The solution has at first a pale port-wine appearance, which darkens on exposure to the air: it has a pleasant taste, and each ounce contains thirty grains of salicylate of iron. Its primary action seems to be to promote secretion, stimulating the skin. It does not constipate the bowels, but rather corrects the alvine secretions. As a prophylactic against septicæmia after surgical operations it is valuable. For diphtheria and the aphthous condition of the tongue in children, in solutions containing 4–10 grains to the ounce, combined with glycerin, or with chlorate of potash, or both, it can be used with freedom as a mouth wash, and as a medicine. In erysipelas it may be given in doses of a tablespoonful, alone or combined with diaphoretics. It promotes perspiration, cleans the tongue, lowers the temperature, and reduces the pulse. It may be administered with freedom and in large quantities in cases of anæmia, without interfering with digestion. In skin diseases also, and in desquamative nephritis where the digestive organs have become weakened, and a salt of iron is indicated, its powers are very marked. Salicylate of iron seems to combine the astringent powers of the iron, but in a minor degree to the sulphate or perchloride, with the antiseptic, antipyretic powers of the salicylic acid. If the preparation is long continued, some of it passes out unchanged with the urine.—*Practitioner*, Oct. 1879.

Relative Action of Duboisia and Atropia.

Dr. Sydney Ringer contributes a short article on this subject to the *Practitioner* (Oct. 1879), from which we extract the following:—

Since Mr. Tweedy first brought Duboisia myoporoides to the attention of the profession in England, the alkaloid has been largely used as a topical application to the eye, in a solution corresponding to the officinal preparation of sulphate of atropia, namely, one grain in 120 minims. This application has caused many unpleasant symptoms. In one case under my care the duboisia caused much weakness, depression, and giddiness; he felt as if he were drunk. Another patient said it causes "great discomfort in my stomach, and a feeling as if a huge lump was in my throat. My power of distinguishing one article of food from another by the taste is taken away." In this patient it also caused great giddiness.

These accounts led me to test, with the assistance of Mr. W. H. Neale, the relative action of sulphate of atropia and sulphate of duboisia.

We first administered by the mouth a dose of sulphate of duboisia, and carefully noted the symptoms, and we then, on a subsequent day, gave a corresponding dose of sulphate of atropia. On one occasion we gave two doses of $\frac{1}{120}$ grain of sulphate of atropia at an interval of two hours. On five occasions we gave $\frac{1}{120}$ grain.

Duboisia, we find, produces identically the same symptoms as atropia, but is far more powerful than atropia.

After duboisia, the symptoms begin in about half an hour, and reach their height in about two hours. The earliest symptom is dryness of the mouth. After $\frac{1}{120}$ grain, there occurred great dryness of the mouth; dilatation of the pupils; much giddiness, almost preventing walking, and increased by exercise; slight drowsiness and rambling; great weakness, so that the limbs felt heavy and were raised obviously with considerable difficulty, with so much difficulty, indeed, that the woman could scarcely feed herself, and her grasp was very weak. It produced flushing of the face, and on one occasion patchy erythematous redness, the skin at these places being rather swollen and hard. The pulse became much fuller and rather slower. These symptoms lasted about seven to eight hours.

The same dose of sulphate of atropia only produced slight subjective dryness of the mouth. After the administration of $\frac{1}{60}$ grain in two doses, with two hours interval, we observed the same symptoms for the most part. The man became very drowsy and delirious; his delirium was of the busy kind, he incessantly tried to pick up imaginary things from the floor. He had also decided twitchings of his limbs, and his pulse rose from 84 to 120, and his respiration from 18 to 30 per minute. The symptoms left him in about ten hours. The $\frac{1}{60}$ grain of atropia, on a subsequent day, only caused subjective dryness of his mouth.

These observations confirm my previous observations, published in the *Lancet* for 1878 (See *American Journal of the Medical Sciences*, April, 1878, p. 526). I then found that duboisia, in addition to the symptoms above detailed, causes headache, checks perspiration, antagonizes the action of muscarin on the heart, and produces late tetanus in frogs—effects it possesses in common with atropia.

Duboisia, then, possesses the same properties as atropia, but is far more powerful than atropia. Mr. Tweedy found this to be the case in regard to the local application to the eye. But whilst duboisia is far more powerful than atropia on man, the reverse is the case in respect to frogs. Atropia paralyzes far more powerfully the motor nervous system, the heart, and respirations, in frogs, than duboisia.

[For a careful study of the physiological and toxic effects of duboisia the reader is referred to a paper by Dr. Wm. F. Norris, in the *American Journal of the Medical Sciences*, April, 1879, p. 446.]

Therapeutic Uses of Iodoform.

E. KURZ (*Memorabilien*, August 15) says that he has used iodoform ointment with good result in cases of orchitis, strumous swellings, lymphadenitis, lymphangitis, periphlebitis, and exfoliations in the pelvis. In a recent case of indurated chancre, an ointment of one part of iodoform to ten of glycerine ointment produced a cure in a few days; secondary symptoms, however, appeared afterwards. In another case, a large soft chancre with bacony base and ragged edges on the inner part of the prepuce, was cleansed in a few days by the application of a similar ointment once daily; and the sore was completely healed in a fortnight. A patient with spinal myelitis had for several years suffered from prurigo of the arms and thighs, with moist eczema of the legs. Inunctions of the iodoform ointment produced marked improvement of the prurigo in the course of the week; but the eczema become worse. This was relieved, but not quite cured, by the use of boracic acid ointment. A scrofulous boy, with enlarged cervical glands, was treated by iodoform locally and cod-liver oil internally. After some weeks, no trace of the glands could be felt. In a communication to the *Allegemeine Medicinische Central-Zeitung* of September 13th, Dr. Lindermann states that he has found that the balsam of Peru is capable of completely masking the disagreeable odour of iodoform. The addition of two parts of the balsam to one of iodoform is sufficient; but a greater quantity of the former may be used. The best vehicles for ointment are lard, glycerine ointment, and especially vaseline; and for liniment, glycerine, spirit, and collodion. Dr. Lindermann gives the following formulæ. ℞ Iodoformii partem j; balsami Peruviani partes ij; vaselini, *seu* adipis suillæ, *seu* unguenti glycerini, partes, viij. Fiat unguentum. ℞ Iodoformii partem j; balsami Peruviani partem iij; spiritus vini rectificati, *seu* glycerini, *seu* collodii, partes xij. Misce. In making these preparations, the iodoform and balsam should be first rubbed together, and the other ingredients then added. Dr. Lindermann calls attention to the fact that the application of balsam of Peru has been recommended by Dr. Caspari and others in various cutaneous diseases and ulcerative processes.—*Brit. Med. Journ.*, Sept. 27, 1879.

The Action and Uses of Hyoscyamia.

Mr. Engledue Prideaux, Assistant Medical Officer at the Friends' Retreat, near York, in concluding an elaborate paper on this subject (*Lancet*, Oct. 11, 1879) presents the following as a summary of the results of the use of hyoscyamia in a considerable number of cases in his hospital, and in the cases reported by others, in regard to its advantages and disadvantages in the treatment of the various diseases of insanity.

1. That in most cases of mania, or where there exists great excitement of an aggressive and destructive character or rapidity of movement and speech, the use of the drug is the most effectual and rapid means of exercising that form of restraint which has been termed "chemical restraint."

2. That in cases of acute mania it will produce sleep and quietude when all other drugs have failed, and is one of the most rapid and reliable narcotics we possess.

3. That in the treatment of the epileptic status in epileptic mania it diminishes the number, frequency, and severity of the attacks, especially if its administration be extended over some time.

4. That in delusional insanity, especially the mania of suspicion and other forms of mania where the delusions are varying and changeable, it has a decided action in producing such an altered condition of the cerebral status that a condition which has been termed "physiological mania" results, and this so eclipses the former delusions and hallucinations that they are forgotten and the mind becomes clear; while, if the subjection to the influence of the drug be continued, it ultimately leads, under favourable circumstances, to a permanent condition of quiescence and restoration to a healthy state of mind.

5. That in chronic dementia, associated with destructive tendencies, bad habits, and sleeplessness, the condition of the patient much improves after a continued course of small doses of the drug.

The disadvantages that have occurred in its use, and which have to be guarded against, are: The dryness of the tongue and pharynx that occurs, especially after a prolonged administration. This has been thought to contra-indicate its use in cases of artificial feeding, but provided the tube be dipped into an oily liquid before passing I have not found it any inconvenience. The attacks of vomiting that have occurred in some cases, after an administration of some weeks, necessarily lead to a discontinuance of the drug. Vomiting occasionally occurs after one dose, even a small one, and in two cases, mentioned by Dr. Lawson, hæmatemesis took place. Where rapid and sudden action of the drug is feared in feeble cases, it is better to administer it with the food.

Therapeutic Uses of Benzoate of Soda.

Buchholtz discovered that the benzoate of soda possesses in a high degree the power of preventing the development of bacteria in putrescible fluids. Brown found that a previous hypodermic injection of the drug will prevent, to a certain extent, the development of diphtheria from inoculation in an animal. Dr. Schüller, of Greifswald, used it as an antiseptic dressing, but did not find that it possessed any advantages over carbolic or salicylic acid. Given internally, however, he found it very beneficial in several cases of extensive phlegmonous processes in the hand and forearm, and of erysipelas, and in one case of diphtheritic inflammation of the bladder. In all of these cases the fever disappeared entirely, and the local symptoms improved, after from 10 to 20 grammes had been taken. The effect was particularly striking in a case of violent traumatic erysipelas with chill and high fever, in which 25 grammes were taken within 24 hours. The fever began to sink after a few doses had been administered. The remedy also proved useful in some cases of scrofulous articular affections with simultaneous catarrh of the pulmonary apices and persistent hectic. Schüller's formula of administration was: benzoate of soda, 10 grammes; syrup, 20 grammes; water, 200 grammes (ʒijss.—ʒv.—℥vjss.). Dose, a tablespoonful four or five times daily, when its use was continued for a long time, and every hour in acute febrile affections.

Prof. Klebs believes that the drug is absorbed very slowly by the intestines when fever is present, and hence recommends its direct injection into the blood. Experimentally it seems to be demonstrated that immense quantities can be injected into the blood without danger; as much as 5 grammes would have to be injected in the case of a man of ordinary size, to prevent the development of bacteria in the blood. The only danger to be feared would be paralysis of the heart, an effect which would be due to the soda rather than to the benzoic acid. Klebs suggests that this danger might be avoided by the use of the less soluble *benzoate of magnesia.* This salt may also be given internally in powder or pills in place of the benzoate of soda, when the latter causes nausea. The *benzoate of lithia* is said to be more soluble than the magnesia salt, and like it to have no action on the pneumogastric.

Letzerich gave the benzoate of soda in eight cases of severe diphtheria in children, and states that no other remedy has produced in his hands such rapid and lasting effects. The temperature usually fell in from 24 to 36 hours. Only one of the patients died—a badly nourished child, who had just recovered from an attack of croup. Besides the internal administration of the drug, it was employed locally by insufflation or gargles. Hoffman, of Berlin, treated 12 cases of diphtheria with the drug; all of them recovered. He believes that the medicine essentially shortened the course of the disease. On the other hand, Widerhofer, of Vienna, treated 17 cases of diphtheria in children with the benzoate of soda, and lost eight of the patients. He does not regard it as a reliable remedy in this disease.

Letzerich also recommends the benzoate of soda in gastric catarrh, particularly in infants, and in this he is seconded by Kapuscinski, of Posen, who administered it in 63 cases of gastro-intestinal catarrh in children under five years of age, with the most striking results. The vomiting was controlled very rapidly, but the drug had no power over the diarrhœa, which yielded, however, to bismuth and soda after the vomiting ceased. He gave one or two teaspoonfuls of a 5 per cent. solution of the salt every two hours. Finally the benzoate of soda has been given with good effects in two cases of morbus Brightii, one of which had already presented uræmic symptoms. Five grammes of the salt were given three times a day, and under this treatment the albumen in the urine rapidly diminished, and soon only traces of it were left.—*Med. Record*, Oct. 18, 1879, from *Allg. med. Cent.-Zeit.*, July 16, 1879.

Unusual Effect of a Hypodermic Injection of Morphia.

Dr. Aug. M. Tupper, of Rockport, Mass., reports (*Boston Med. and Surg. Journal*, Oct. 30, 1879) the case of a healthy-looking man, aged about 30, who was suffering severely from lumbago; counter-irritants having failed to afford relief, he injected directly over the seat of pain nine drops of a solution of sulphate of morphia, one grain to a drachm of water with one drop of carbolic acid to keep it. In five minutes the patient was relieved. In about five minutes later he complained of nausea, before a basin could be given to him he grew deadly pale, his eyes rolled up, so that only the whites were visible, jaws were clenched, head drawn back, the whole body stiffened, respiration ceased, and the pulse at the wrist was absent. Cold water was instantly dashed in his face. In about a minute his eyes were observed to be widely open and staring, and the pupils widely dilated. Very soon the colour began to return to his face, he was drenched with perspiration, and recovered consciousness. His pulse was now sixty, full, but irregular.

Dr. Tupper has given the same mixture a great many times without the slightest trouble. The solution was freshly prepared the morning it was used and the same dose had been on the same day injected under the skin of a neuralgic female before using it on the patient whose case is above narrated. The injection entirely relieved the lumbago.

This and similar cases which have been reported from time to time show that in patients whose tolerance to the hypodermic use of morphia is not known, it is not safe to begin with a larger dose than one-eighth of a grain.

Medicine.

Note on the Salicylate and Alkaline Treatment of Acute Rheumatism with an Analysis of One hundred and fifty-eight cases.

Dr. David W. Findlay, Medical Registrar, and Mr. R. H. Lucas, late Resident Medical Officer of Middlesex Hospital, compare (*Lancet*, Sept. 20, 1879) the results which have attended the use of salicylate of soda in the treatment of rheumatism with two other methods most commonly used in the wards of the Middlesex Hospital immediately prior to its introduction.

The salicylate of soda, they say, on account of its greater solubility, and for other reasons which need scarcely be mentioned here, has established its position as the favourite preparation; and our observations refer to it alone as representing the salicin group.

The conclusions which we have to offer for consideration now suffer necessarily from want of novelty, but they may not be uninteresting, as they corroborate in a marked manner many of the observations which have been previously made as to the results of the treatment in question.

In estimating the effect of any drug at the bedside, it is necessary, firstly, to review a fairly large number of cases, and, in the second place, to take care that those cases are placed under similar conditions. The results we have to show are those of an analysis of 158 typical cases of acute rheumatism treated in the Middlesex Hospital—60 by salicylate of soda, 60 by the old alkaline method, and 38 by a combination of alkalies with quinine. All of these cases, with the exception of the drug administered, were treated in a precisely similar manner, and influenced by the same surroundings.

The following are the points to which we have directed our inquiry, with a comparison of the results of the different systems of treatment.

Pyrexia.—The average duration of pyrexia in the cases treated by the salicylate of soda was found to be 5.7 days. In the cases treated by alkalies alone it was 10.3 days; and in those in which quinine was combined with the alkaline treatment it was 11.6 days. It will thus be seen that the first-named drug exhibited a marked superiority over the others. With regard to the influence of the quinine in the last-named group, it is not easy to see how this should have been unfavourable. Probably the smaller number of cases may render the observation of doubtful value, and the drug itself was not given in what would now be considered anti-pyretic doses.

Joint affection.—The difference in result is no less, but rather more, marked under this head; for while the cases treated by the salicylate show an average of 5.06 days' duration, the averages for the treatment by alkalies, and by alkalies and quinine, respectively are 12.2 and 10.07.

Influence on the condition of the heart.—Looking to the power possessed by the salicylate of cutting short the pyrexia and joint affection, one would naturally expect that its influence would appear also in limiting the tendency to the occurrence of endocarditis and pericarditis. This, however, is not borne out by the results of our analysis. Of the cases treated by the salicylate 11.6 per cent. developed endo- or pericarditis under treatment, while the percentage in the case of the alkaline treatment was 6.6, and in the combined treatment 13.1. Too much stress must not be laid upon the comparison in regard to this point, for it must be borne in mind that nearly 70 per cent. of the cases in the first and second group, and over 50 per cent. of those in the third, have some heart complication developed before admission to the hospital, thus leaving a comparatively small number from which to draw any general conclusion. The great probability is that the influence of any method of treatment in averting the tendency to heart affection is very small indeed. It has been dogmatically asserted that pericarditis never supervenes after the system has been got thoroughly under the influence of the alkaline treatment; but this position is obviously untenable.

Relapse.—Hitherto there has been little but praise to bestow upon the salicylate treatment; but we now come upon unfavourable ground. In the cases treated by the salicylate there occurred relapses in 26.6 per cent.; in those treated by alkalies, and by alkalies and quinine, 8.3 and 7.8 per cent. respectively. The results here are very much against the salicylate treatment, and there is a universal concurrence of opinion on this point among all who have investigated the subject. It may be hoped that this undoubted tendency to relapse may be overcome after further experience, and to this end a gradual discontinuance of the use of the drug, together with a longer confinement to bed, and liquid diet, seem to hold out the most hopeful prospects.

Return of pain without pyrexia.—Here, too, the balance of evidence is rather against the salicylate; and it is only what we should expect, looking to the facts detailed in the previous section. Ten per cent. of the salicylate cases show return of pain, as against 6.6 per cent. of the alkaline and 18 per cent. of the alkaline and quinine combined. It should be remarked that the return of pain in the salicylate cases has generally taken place after the use of the drug has been discontinued, and the pain has been quickly relieved by a return to the remedy.

Stay in the hospital.—With regard to the stay in the hospital, the alkaline treatment gives the most satisfactory results, the salicylate treatment next, and the combined alkaline and quinine the least favourable. So many disturbing elements, however, come in here in the way of complications, such as pleurisy, bronchitis, pneumonia, etc., that the value of the comparison on this head is but slight. Owing to the shorter duration of pyrexia and pain occurring in connection with the salicylate treatment, convalescence becomes established much sooner than when the other methods of treatment have been employed; and were it not for the dangers of relapse these cases might be discharged at a much earlier period. With the discovery of some modification in the plan of treatment which should obviate this risk, a notable improvement may be looked for here.

In conclusion, we would remark that cases occasionally occur which seem to be quite insusceptible to the action of salicin or its compounds; while, on the other hand, a few so speedily show its toxic effects (such as giddiness, sickness, headache, and delirium) that its use has to be abandoned before it has had time to influence the rheumatism.

It should be noticed that the usual dose of salicylate of soda was fifteen grains every three hours; of the alkalies, fifteen grains of the bicarbonate of potash, with a like quantity of the acetate, every four or six hours; and of quinine, where this was regularly given, two to five grains in pill, thrice daily.

Spinal Hypertrophic Pachymeningitis.

Dr. **Berger** reports several cases of this affection, one of which, that of a woman aged 45, presents features of peculiar interest, as the patient recovered after having suffered for years. After repeated severe chills she had felt violent sharp pains in the cervical vertebral column, and the left elbow and shoulder-joint. At the same time her neck became stiff, and the left arm grew very weak. The muscles of the thumb, the interossei, and the forearm became gradually very much atrophied. The right arm was less affected. The treatment consisted in galvanization of the spine and extremities, the administration of iodide of potassium, and in the production of suppuration of the spinal region. The patient recovered entirely and regained flesh. The author particularly draws attention to the usefulness of warm baths of several hours' duration in the first period of the disease. He has found them answer very well in a case of what seemed to be meningitis of the lumbar vertebra, after typhoid fever. Herr Berger points out that the diagnosis of hypertrophic spinal pachymeningitis can only be made with certainty when atrophy of the muscles has set in.—*Lond. Med. Record*, October 15, 1879.

Case of Hydrophobic Tetanus.

An interesting case of hydrophobic tetanus is reported by Dr. **Kirchhoff** (*Berl. Klin. Woch.*, No. 25, 1879). The patient, a woman aged 52, happened to fall with her face into some briers. Several of the thorns penetrated her face, but were immediately drawn out by another woman who happened to be with her. In the course of the week following the accident the patient's face was much swollen, then she found it impossible to open her mouth; both deglutition and respiration were much impaired. On the seventh day she fell into convulsions; on the eighth day the left facial nerve had become paralyzed. When first seen in the hospital she was in a half-sitting, half-crouching position, clutching at her lower lip, and trying to pull it down with both hands. A stream of saliva ran out of the mouth, had macerated the epidermis of the finger tips and soaked her clothing. Respiration was frequent, the inspiration was not hindered, but every expiration was followed by a short groan, while at the same time a perfect shower of saliva came out of her mouth. Simultaneously her back became more arched, and the head and thorax were slightly turned to the right. The right eye was closed, the left only partially so, the right corner of the mouth was higher than the left, and was drawn towards the right. The pupils were alike and narrow; they reacted to light, and moved normally. On keeping the mouth forcibly open, inspiratory raising of the velum of the palate could be seen. In the left temporal region was a small abscess, which, on being touched, evoked strong tetanic convulsions of the thorax. At the same time the face was drawn more towards the right. The patient was put under chloroform, and an incision made in the wound, whereupon a thorn three centimetres long was extracted. The patient was offered some water to drink, at the mere sight of which she seemed to be filled with horror. It was impossible to make her swallow some with a spoon. The opisthotonos became worse, the head was distinctly drawn backwards. The extremities did not take part in the convulsions. The urine contained albumen. The faradic contractility of the muscles of the left side of the face had not been destroyed; it was, however, much weakened when the stimulus was applied to that portion of the facial nerve which runs out of the stylo-mastoid foramen. This proved that the paralysis was of peripheric origin. The patient was very cyanotic; her pulse was small and frequent. A systolic blowing murmur could be heard at the apex of the heart. The left trifacial nerve was not affected, as seen by pricking the patient's face with a needle, for the right half contracted with an evident expression of pain. The patient was treated with large doses of bromide of potassium and chloral hydrate. She died on the second day of her stay in the hospital. Two hours before her death the temperature was 101.2°; ten minutes after death 104° in the vagina. It is noteworthy that the patient had never been bitten by a dog. At the *post-mortem* examination a cyst of the size of a pea was found in the left corpus striatum; below it was a small grayish focus. The pons and medulla were soft, and dotted with pink spots, but apparently normal. The spinal cord was in the same condition. On examining it with the microscope very numerous corpora amylacea were found in the brain and cord. The thoracic and abdominal viscera did not present any remarkable changes. The left facial nerve was microscopically examined, but no pathological alterations could be detected in it. Reflections: It was very difficult in this case to make correct diagnosis at once, as many of the symptoms, *e. g.*, the unilateral paralysis of the facial nerve, the impossibility to swallow, the convulsions and expression of terror at the sight of fluid, and the restlessness of the patient, seemed all to point more towards hydrophobia. At the same time the opisthotonos, the contraction of the abdominal and masseter muscles all betoken tetanus, as well as the convulsions which were synchronous with the expiration. It seems that Rose has been the only one to notice this peculiar form of tetanus. He has also given it the name of hydrophobic tetanus. Dr. Kirchhoff supposes that in this case the tetanus was owing to a pressure on, or injury of, the facial nerve, and that the tetanus was merely a reflex act.—*London Medical Record*, Oct. 15, 1879.

Reflexes in the Spinal Cord.

The following cases are reported by Dr. WEISS. A man, aged 26, had received a blow on the neck. This was immediately followed by paraplegia and anæsthesia of the lower extremities. The upper extremities had remained normal, with the exception of occasional tonic spasms of the flexor muscles. Reflex irritability was extinct on the lower extremities, and the remaining anæsthetic parts of the body, and remained so till the patient's death, which ensued on the third day after the accident. The bladder and rectum were paralyzed. The *post-mortem* examination revealed a fracture of the sixth cervical vertebra, which had involved destruction of the cord at the corresponding place. The other case is that of a man, aged 36, who had fallen down unconscious after a leap. Both upper and lower extremities were paralyzed. Sensibility was extinct in the lower extremities, and the trunk up to the nipples, bladder and rectum, were paralyzed. The *post-mortem* examination showed that the ligament between the fifth and sixth cervical vertebræ had been divided; the vertebræ were dislocated, and the cord destroyed. This seems to prove that the reflex irritability of the cord decreases immediately after it has been separated from the brain, and that this condition lasts for some time.—*London Med. Record*, Oct 15, 1879.

Treatment of Chorea with Ether Spray.

Dr. **Mareiglia** describes (*Annali Clinico dello Ospedale incurabili*, anno iii. fasc. v.), in detail, four cases of chorea varying in severity as well as in cause. All had commenced with an alteration in the voluntary movement, after which disturbance of sleep and involuntary movements had appeared. In two cases these symptoms were accompanied by affections of the speech, whilst in one the movements were restricted to the right side, affecting only the facial muscles. In two cases, likewise, the cause was fright, in one a previous attack of meningitis, and in one rheumatism. The age of the patients varied from 7 to 14 years, and they were treated in every case with the ether spray as recommended by Lubelsky. The spray was directed along the whole length of the spine by means of a Richardson's apparatus for a breadth of 7 cm. The application was continued for 3–4 minutes, and was made twice, thrice, and even four times a day. With the exception of the second case, which had lasted for three months, the disease had not continued for more than fifty days. The treatment with ether was carried on for 17–30 days, except in this second case, where the disease was of more than two months' standing, in which it was continued for forty-five days. Dr. Mareiglia describes the result of this mode of treatment as being immediately successful. The symptoms were lessened on the first application of the ether spray, and there was a marked improvement within the week. In the first successful case there was no reddening of the skin which had been subjected to the ether spray, such as had been noticed by Jaccoud, but there was a marked paleness with the formation of "goose-skin."—*Practitioner*, Oct. 1879.

Hypodermic Injections of Fowler's Solution in Chorea.

Dr. L. **Peroud**, Professor of Diseases of Children to the Faculty of Medicine of Lyons, has employed hypodermic injections of arsenic in chorea since 1875. M. **Henri Garin** describes in his thesis (*Thèse de Lyon*, No. 14) results obtained in thirty-three cases of chorea in children at the Charité Hospital. In the method followed by M. Péroud, usually four or five drops of pure Fowler's solution are injected into the cellular tissue by means of a Pravaz's syringe. An injection is made every day; sometimes every second or third day. The region preferred for injection is some part where there is loose cellular tissue and few nervous filaments. It is sometimes preferable to inject at the level of muscles most affected. The cases related occurred in female children from the age of 4½ to 14½. Among them were recent, old, and relapsed cases; cases of rheumatic, of paralytic, and of cerebral chorea. M. Garin's reason for preferring subcutaneous injections are these: first, they do not give rise to gastric disturbance; second, the curative effect is generally more rapidly obtained; third, only very small doses administered every two or three days, are needed. Subcutaneous injections cause little trouble in children; they give rise to no local irritation, although sometimes, when the organism has become saturated, slight induration occurs at the punctures. Sometimes intolerance of arsenic is met with; but this is rare, especially in children, who take it very well. Under the influence of hypodermic arsenical medication, rapid amelioration is the rule. At the same time that the chorea advances to cure, the children become fat, the weight of the body progressively increases, and the amount of solid matters excreted by the kidney diminishes. Under the influence of arsenical injections, sixteen cases of chorea ended in recovery after an average of thirty-two days' treatment and about eighteen hypodermic injections. In these sixteen cases the treatment was purely arsenical. Of thirteen other cases of chorea submitted to injections of arsenic and also to various other remedies, ten recovered; but a longer time was necessary. These thirteen were, moreover almost all old or relapsed cases. Hence it may be concluded that arsenic has more chances of cure in recent and simple cases than in old and inveterate cases. This is contrary to the assertions of Aran and Ziemssen.—*Brit. Med. Journ.*, Sept. 27, 1879.

On Stammering.

At the recent International Medical Congress held at Amsterdam, M. CHERVIN, of Paris, read a paper on stammering. This disturbance of speech is generally ascribed to a spasm of the muscular apparatus that aids in the articulation of sounds. This theory, which is essentially false, has led surgeons to perform many unfortunate and useless operations (section of the tongue or of certain of its muscles, of the hyoglossus; extirpation of the tonsils, the uvula, etc.). M. Chervin thinks that stammering is caused simply by a disturbance in the co-ordination of the movements that are necessary to emit an articulated sound. This explains how it is that this disturbance of speech is frequently of an intermittent type; and why, under the influence of a methodical treatment, which is in reality only a series of gymnastic exercises, that are practised by the apparatus which helps to form articulate sounds, it is possible to cure this affection in a very short time. The author has gathered from statistics that, from 1850 to 1869, 13,215 young men in France were exempted from serving in the army because of stammering. Great discretion must, however, be exercised in delivering certificates on the subject, as stammering is very easily counterfeited. In general, fright and emotion play a great part in the etiology of the affection. It occurs more frequently in the male sex than in the female, which the author attributes to the fact that young girls are less exposed to violent emotions. The treatment lasts about three weeks. During the first week, the patient has to go through methodical exercises of reading and recitation for a certain number of hours daily; for the remainder of the time, he must be perfectly silent and isolated from his friends. In the second week, he is allowed to speak to his attendants or friends, but must speak very slowly, and pronounce each syllable distinctly. In the third week, the patient may converse freely, but must still speak very slowly.—*British Med. Journal*, Sept. 27, 1879.

Treatment of Diphtheria by the local application of Bromide of Potassium.

At a late meeting of the Société de Thérapeutique (*Gazette Hebdomadaire*, Oct. 17, 1879) M. Dujardin-Beaumetz presented a paper in the name of Dr. PEYROT (of Libourne) on the treatment of diphtheria by direct local applications of bromide of potassium. This paper is based on 42 observations, in which the results of this treatment were most satisfactory. M. Peyrot sometimes uses a solution of from 15 to 20 grammes of bromide of potassium dissolved in 100 grammes of water and in glycerine, sometimes a very fine powder of bromide of potassium, which he employs by insufflation; he has also used the solution in pulverization. The object he has in view is first to destroy the false membranes, and then facilitate the renewal of the mucous membrane.

M. **DUJARDIN-BEAUMETZ** added that bromide of potassium possesses caustic properties, less active, however, than those of chlorate of potassa.

Morphia in Asthma.

M. **HENRI HUCHARD** has published (*Le Progrès Médical*, July 5, 1879) an interesting series of investigations upon the eupnœic action of morphia, more especially in regard to the rapid cure of asthmatic attacks by the employment of hypodermic injections of this drug. M. Huchard briefly narrates four cases which he has treated, and then proceeds to quote the favourable opinions of authors who have already made trial of morphia in dyspnœa. M. Huchard believes that opium is of use in certain cases of asthma to combat the spasmodic affection, and he even ventures to regard it as one of the chief remedies. It is readily understood how the bronchial spasm may be reduced by the rapid absorption of morphia, though the drug is less serviceable in bronchial catarrh, and is almost useless in emphysema. Morphia is not only a remedy in sudden attacks of asthma, with great orthopnœa and but little chronic pulmonary mischief, but it is also of use to alleviate in a very short time an old and organic state of the lung. Great benefit is derived from its employment in cardiac pseudasthma, in uræmic dyspnœa and in the last stage of phthisis. In every case the morphia seems to act by alleviating the cerebral anæmia, and the lesions of the medulla. It plays an important part in the therapeutics of heart disease, as has already been demonstrated by M. Huchard, who sums up his previous results in the statement that morphia is to aortic diseases what digitalis is to mitral affections. The morphia must be administered subcutaneously in dyspnœa, and the injections may be given without any fear of morphinism. M. Huchard believes that morphia causes respiration, and that this eupnœic action is apart from its narcotic effect. In any case his results are readily verified in every-day practice.—*Practitioner*, Oct. 1879.

Tuberculosis in Infants.

From a consideration of nine cases of tuberculosis in infants from ten weeks to ten months of age, including seven fatal cases with necropsies, Dr. **ALOIS EPSTEIN** (*Prager Vierteljahrsschrift*, Band 142), concludes that the presence of the disease in infants is in most cases due to infection with the milk of a tuberculous mother, and not to hereditary predisposition, as is usually supposed. Two of the children were the offspring of healthy mothers, but one was suckled by a phthisical wet-nurse. Seven were the children of phthisical mothers. In one of the cases, there were intestinal ulcers and cheesy infiltration of the mesenteric glands. The author remarks that the tuberculosis of infants and young children differs from that of adults in the great frequency with which the lymphatic glands, and especially the glands of the small intestines, are affected, and also in the comparative rarity of pulmonary disease in children. These facts appear to indicate that the starting-points of tuberculosis in children and in adults are different; and that, while in adults and older children it is breathed in, it is sucked in by infants and young children.—*British Med. Journal*, Oct. 18, 1879.

Hypophosphites in Phthisis.

Dr. Coghill, in a critical review of the value of the hypophosphites of lime and soda, gives the results of this treatment in 100 indiscriminate cases where it was fairly tried in the Royal National Hospital at Ventnor. 57 improved, 17 remained in *statu quo*, 26 got worse, and 4 died. Of 328 patients otherwise treated, 240 improved, 39 remained in *statu quo*, 25 got worse, and 20 died. "It seems evident from these statistics that the hypophosphites have no claim whatever to the character or properties of a specific remedy in the developed stages of pulmonary consumption." "In only 25 per cent. of the cases could they be employed unaided, and these were cases in which change of climate, improved dietetic and hygienic conditions with general tonic treatment, would probably have shown good results. Great disappointment resulted from their impotency in checking such characteristic symptoms of the disease as night sweats, or influencing favourably the febrile conditions indicating advancing lung mischief. That, however, these salts have, when judiciously employed, valuable tonic properties, promoting the appetite, the digestion, and the assimilation, more especially of fatty food, was strongly impressed on all. They have certainly no specific influence (so far as I have been able to form an opinion, after the most careful and unbiassed observation) either in arresting, when in progress, or markedly promoting repair when stayed, the several forms of pulmonary phthisis, whether tubercular or pneumonic." Although by no means specific in the tubercular diathesis, still, Dr. Coghill highly values the hypophosphite of soda as a nervine tonic, and perhaps even as a tissue-builder.—*Lond. Med. Record*, October 15, 1879.

Relation between Heart Disease and Hysteria.

M. Armaingaud (*Journ. de Méd. et de Chirurgie*, May, 1879) publishes two cases which appear to show that there is a relationship between cardiac lesion and hysteria in man, such as is already known to exist between heart disease and chorea. In one of these cases, a man, aged 28, suffered from mitral insufficiency accompanied by contraction of the aorta; he also experienced oppression, palpitations, and various phenomena indicating cerebral anæmia, with hysteric convulsions. For a month these attacks occurred two or three times a week. The treatment adopted by the author consisted in the hypodermic injection of morphia, to relieve the cerebral anæmia. The drug in doses of a centigram was at first given daily, but at a later period it was found that two injections a week were sufficient. By this means the convulsions were entirely removed, whilst the phenomena of cerebral anæmia so far disappeared as to allow the patient to resume his occupation.—*Practitioner*, Oct. 1879.

Henning on the Appearance of the Tongue in Disease.

(1) The *elongated* and *pointed* tongue invariably indicates irritation and determination of blood to the stomach and intestines. The extremities are often cold. It is also associated with excitation of the nerve centres. This tongue is often found, but more especially among children. The indications are to allay irritation and divert the blood from the stomach and bowels. We should be very careful how we make our prescription in such cases, as, if we give an irritant cathartic it invariably aggravates the disease. (2) The *pinched* and *shrunken* tongue indicates atony of the digestive organs, often found in dyspepsia and kindred diseases. The treatment is plain, the pathological conditions being evident at a glance, from the appearance of the tongue. (3) The coating

(*saburra*) or fur should be well studied. It may be greater or less in thickness, dry or moist, or clammy, more accumulated at the posterior portion. It is said that when the tongue is heavily coated at the base, with a deep yellow coat, the liver is at fault. This is not always the case; and, from my observation, more often not the case. I have seen cases of jaundice with a white-coated tongue. Tobacco chewers nearly always have a yellow-coated tongue, and their liver may be sound. (4) The *dry* tongue has a very important significance. When we have patients who are suffering from some form of fever, pneumonia, or any other acute disease, with such a tongue, they are in danger, and require close attention. In such cases nutrition and assimilation are suspended, and food cannot well be taken, and, if taken, cannot be properly assimilated. When given, it should be in fluid form, and always above the temperature of 100°, and of a character nutritive and digestible. The digestive organs can do but little work, yet proper food given at proper intervals does good; but these organs need all the rest they can get until the disease is subdued. Dryness of the tongue is also associated with vascular excitement, and particularly with excitation of the ganglionic and nerve centres. Hence the arrest of secretion and this dryness. Here we readily read the state of the *nervous system*. In many cases, the sympathetic nerve is not only excited and irritated, but there is involuntary contraction of muscular tissue, thus suspending the secretions of the several organs. The indications are, proper sedatives for the vascular excitement, and diaphoretics for contractions or excitement of the nerves, associated with other proper treatment. By this course we shall soon see our patient with a moist tongue, and some of the secretions re-established. (5) Often the tongue changes in the disease from the dryness above referred to to a brown or black colour, with sordes about the teeth. The common idea is that the system is in a typhoid condition. This is true; yet it undoubtedly means, also, that the blood is in a septic condition—a very important fact for us to know. Then our best antiseptics should be given, with stimulants and tonics. Thus we can readily read, from the appearance of the tongue, the condition of the digestive organs, function of nutrition and assimilation, the condition of the nervous system, and the state of the blood. Of course, we must take all other symptoms into consideration. Yet the appearances of the tongue, as pointed out, seldom fail in giving us, at a glance, valuable information as to the true condition of the system.—*London Med. Record*, Oct. 15, 1879.

Treatment of Diarrhœa in Tuberculous Patients.

The following dietetic rules for the treatment of diarrhœa in tuberculous patients are given by M. Péter (*Lyon Méd.*, No. 32): 1. Diarrhœa owing to catarrh of the stomach. Give subnitrate of bismuth dissolved in a little water. Strict diet. If cod-liver oil disagrees with the patient, koumiss must be given in its stead. A teaspoonful of lime-water must be added to every cup of milk which the patient drinks. 2. Diarrhœa caused by excess of food and insufficient digestion. Give one and a half grammes of ipecac. to cause vomiting, and a purgative the next day. The diet must be carefully regulated. 3. Diarrhœa owing to gastro-enteritis caused by ulcerations. Strict diet; very little milk, a soft-boiled egg without bread, or beaten up in beef-tea, raw grated meat, about 20 grammes at a time, blisters on the epigastrium, bismuth, diascordium, theriæ, laudanum. The skin of the abdomen must be rubbed with Cologne water, alcohol, etc., or large blisters applied. Nitrate of silver may be given in pills, containing 1 centigramme each, increasing gradually to 5 centigrammes. Graves even went as far as 25 centigrammes *pro dosi*.—*London Med. Record*, Oct. 15, 1879.

Coto Bark in the Diarrhœa of Phthisis.

Whatever difference of opinion may exist as to the desirability of attempting to arrest the less severe forms of diarrhœa which we encounter in early phthisis, no one can doubt the value of a remedy which will help us to control the grave and exhausting attacks of diarrhœa which occur in its more advanced stages. Dr. J. **Burney Yeo** (*Practitioner*, Oct. 1879) is persuaded that we possess such a remedy in coto bark, and he expresses this opinion with all the more confidence because it has not been arrived at hastily, but represents the observation and experience of more than two years.

During this period, he says, I have given it in many cases of apparently uncontrollable diarrhœa, that is to say, cases of diarrhœa which were not controlled by the ordinary remedies, such for example, as opium, bismuth, tannin, ipecacuanha, etc., and I have found it almost invariably have the effect of arresting the intestinal flux, and of relieving intestinal pain and irritation in a very short time. I say "almost" invariably, for when I first gave it I found no such good result, and on inquiry I found that one of my colleagues had employed it also without effect. This led me to consider the mode of its administration. I found my colleague had given it mixed with other substances and made into pills, and I had given it, in the first cases in which I tried it, blended with the Mistura Cretæ of the Pharmacopœia. It is deserving of notice that when given in both these forms it appeared inert; and one might have been induced to hastily discard it as a drug without remedial value. This is probably the fate of many valuable medicines which appear to fail; not from want of virtue in themselves, but from want of patience and attention in their mode of administration.

Finding that the fluid extract contained a resinous element which was precipitated in tough masses when the extract was carelessly mixed with water. I had the following mixture carefully prepared:

Fluid extract of coto 60 minims.

Compound tincture of cardamoms, 60 minims.

Mix these together and triturate them slowly with mucilage of acacia, 3 drams, and simple syrup 2 drams.

Finally add water to 6 ounces.

A tablespoonful of this mixture is a dose. In this form it is an opaque mixture, with a not unpleasantly warm and aromatic taste. I have usually found two or three doses of this mixture arrest or check the severest forms of phthisical diarrhœa.

The bark is imported from Bolivia in South America, and the preparation I have used is the fluid extract prepared by Ferris & Co., of Bristol. The dose is from 5 to 8 minims. An alkaloid *cotoin* has been prepared from the bark, and is reported to have the same valuable properties as the extract of the bark itself, but of that I have no personal knowledge.

I may add that I suggested its use in a case of exhaustive and uncontrollable diarrhœa in one of the graver forms of exophthalmic goitre, which I saw in consultation with my friend Dr. Chaning Pearse, of Brixton; and he has since informed me that it not only arrested the diarrhœa, but also appeared to have a remarkable influence in allaying the distressing nervous phenomena associated with the case. I am quite sure that coto bark is a valuable remedy which ought rapidly to come into general use.

Hydrate of Chloral in Dysentery.

Dr. **Curci** finds (*Il Racogliatore Medico*, Nos. 15–18, 1878) that chloral hydrate is serviceable in the diarrhœa of typhoid. He has therefore employed it during an epidemic of dysentery in seventeen cases, always with the best results. At first it was administered in combination with potassium chlorate, but afterwards the latter drug was omitted, and the chloral was given alone in a mess of barley-gruel, either by the mouth to the extent of 1–3 grams per diem for an adult, or as an enema (10 grams in 2000 grams of gruel being sufficient for ten enemata). When given by the mouth it is found advisable to administer some slight purgative beforehand to prepare the bowels for the reception of the remedy. Hydrate of chloral is not only a soporific remedy for dysentery, as was supposed by Dr. Prince, who first pointed out its value in this disease, but it has also a sedative, astringent, anti-spasmodic, and anti-diarrhœic action, in addition to its local coagulating and antiseptic properties. If it only lessened pain by producing sleep, its action would be but transitory, whereas it is very persistent, being in reality a sedative to the brain and spinal cord as well as to the sympathetic system of nerves, and it is the latter system which is chiefly affected in dysentery. After the use of chloral it is found that the evacuations are lessened, whilst the flatus, which is such a painful symptom in the disease, is diminished. In regard to the local action of hydrate of chloral, it must be considered that one part is absorbed in the intestine, whilst another is passed on by peristaltic contractions into the cæcum, and colon. After administration in a mucilaginous vehicle in doses of 2–3 grams, the peristaltic movements are at first increased, but then ensue diminished sensibility and movement. These phenomena are due to the stimulation and subsequent paralysis of the sympathetic, and it is in this way that the chloral lessens the pain in the bowels, and the secretion. If the administration be continued till recovery takes place, the chloral exhibits its properties of coagulating albumen, destroying the organized ferment, and hastening cicatrization. In conclusion, Dr. Curci enumerates the other remedies employed in dysentery, and states his opinion that purgatives administered in the early stages of the disease alone approach in value to chloral hydrate. He condemns antiphlogistic treatment, as well as that of opiates and astringents. He has known no good results obtained from the use of ipecacuanha, the so-called radix antidysenterica, since it only acts as an emetic, and is without effect upon the other processes of the disease.—*Practitioner*, Oct. 1879.

Bright's Disease and Primary Cirrhosis of the Kidneys.

At the International Medical Congress held at Amsterdam in September, Professor ROSENSTEIN read a paper upon this subject of which the following are his conclusions:—

1. The anatomical lesions of the kidneys, which determine the group of clinical symptoms first described by Bright, always involve the parenchyma as well as the connective tissue of those organs. 2. There is neither an exclusive parenchymatous nephritis nor an exclusively interstitial nephritis. Experiment and clinical observation show that where a true diffuse renal inflammation takes place both histological elements are affected from the commencement. 3. The final issue of diffuse renal inflammation is the white kidney and the red granular kidney. They form from the anatomical point of view the atrophied kidney, and only differ in this, that the parenchymatous affection is more pronounced in the former, the interstitial affection in the latter. Clinically the two may be distinguished by analysis of the urine. The symptoms of atrophy are common to both modifications. 4. Clinical observation makes it very probable that, just like the white kidney, the red granular kidney—or, as it is now called, "primary cirrhosis"—is preceded by periods of swelling; and this is not contradicted by pathological research. 5. Bright's clinical description relates especially to the granular white

kidney. In this form the morbid process passes through two stages, which can be determined clinically as well as pathologically.—*Lancet*, Sept. 20, 1879.

Colloid Degeneration of the Skin.

A case of this rare skin disease is reported by M. **Ernest Besnier** in the last number of the *Gazette Hebdomadaire*. The patient, a man aged forty-six, entered the St. Louis Hospital in July, 1879, for extensive pityriasis. It was then noticed that the upper part of his face was the seat of a peculiar eruption having the appearance of "citrine" vesicles. These varied in size, from a bright-yellow spot only visible with the aid of a lens, to a mass as large as a grain of corn. Upon pressure and puncture it was found that the eruption was vesicular only in appearance, and upon scraping the skin a colloid substance came away in the curette. Similar deposits of this gelatinous matter were seen on the inner side of each cornea, and one patch existed on the septum, in the left nostril. Locally the eruption did not seem to have caused any trouble, at any rate not before the patient's attention was called to it. The general health was satisfactory; urine normal; the liver and spleen were healthy; the appetite and digestion good, although the patient sometimes suffered from colic and pneumatosis. The only complaint made was of occipital headache, which occurred daily. Microscopical examination of a portion of the skin showed that the lesion consisted of a colloid degeneration of its connective tissue. M. Besnier thinks that this case is analogous to one related by E. Wagner in the *Archiv der Heilkunde* for 1866, and improperly described as "colloid-milium."—*Lancet*, Oct. 18, 1879.

Surgery.

Indications and Contraindications for Operations in Individuals suffering from Constitutional Diseases.

At the late International Medical Congress held at Amsterdam, Prof. **Verneuil** spoke at length on the pathological importance of this question. His communication may be shortly summarized as follows: 1. Surgical operations are not formally contraindicated in individuals who are affected with constitutional diseases. They may be performed under such circumstances, are often useful, and in some cases even very necessary. 2. Their prognosis is much more serious than in healthy individuals. It is less certain, and more difficult to make; for we have no clue whatever as to the favourable or deleterious effect that the traumatic lesion may have on the general health of the patient; neither can we judge in what way the disease will affect the local process of healing. 3. The prognosis varies according to the different constitutional diseases, and for each of them considered individually. It varies also according to the degree of the alterations that have taken place in the different parts of the body. 4. The danger attached to the diathesis is not great as long as it is still confined within the boundaries of dyscrasia. It increases considerably with the manifestation of chemical and histological lesions. It becomes alarming when the principal viscera—such as the liver, kidneys, spleen, heart, lungs—are extensively affected by sclerosis, steatosis, amyloid degeneration, phlogosis; or when they present pathological products that belong specially to certain diathetic conditions—*e. g.*, tubercles, gummata, carcinomata, and various neoplasms. 5. We are not justified in depriving diathetic individuals of the benefit of surgical intervention, even in cases where it might be dangerous. It must be the aim of the practitioner to render the prognosis less serious, and to assure the success of the operation. He will succeed in doing this if he be very careful about choosing the most favourable moment for the operation, adopting the best method for performing it, and applying the most efficient dressing. He will also do well in putting the patient under a hygienic, dietetic, pharmaceutic treatment—in a word, under a medical treatment which is adapted to the constitutional disease. 6. The practitioner must be thoroughly well acquainted with the etiology, pathology, development, the end, and the medical treatment of constitutional diseases, in order to make sure of the indications or contraindications for the operation. In this way, he will be better able to judge whether he had better perform the operation or not, and to calculate with more or less precision what the chances may be. A knowledge of these conditions, which perhaps all surgeons do not possess to a sufficient degree, would tend rather to prevent surgical operations than to encourage them, and would inspire the operator with a higher degree of confidence in the efforts of nature supported by a comparatively mild therapeutic treatment. 7. A conscientious examination of the immediate or future effect of operations performed on individuals under some constitutional diathesis will tend to destroy many of our illusions respecting the power of surgical art. It is sad to say, though we must say the truth, that complete and lasting favourable results are very rare. No doubt, there may be many successful operations; but the therapeutic results may be far from successful. A manifestation of the diathesis or some intercurrent affection may be suppressed; but frequently the constitutional disease increases in force and rapidity. Many patients suffering from cancer and scrofula would live longer if they had remained under medical treatment, instead of passing through the hands of surgeons. 8. It is only just to add that, although the aforesaid operations are more frequently attended by palliative than by curative results, nevertheless they are sometimes extremely useful. In extreme cases, they may prolong life, render it less hard to bear, and give the patient at least a gleam of hope. In less serious cases, and where the constitutional disease may be successfully treated, the operation has a good effect upon the treatment, by allowing the medical man to gain time, suppressing an immediate cause of danger, and giving the therapeutic treatment greater scope.—*British Medical Journal*, Sept. 27, 1879.

On the Cure of Simple Glaucoma by Sclerotomy.

At the late meeting, at Montpellier, of the French Association for the Advancement of Science (*Le Progrès Médical*, Sept. 6, 1879) M. Jaumes (of Montpellier) read in the name of M. DE WECKER, who was prevented from being present, a paper on this subject, in which he recalls in a few words the history of the question, and in particular the treatment instituted by Graefe.

M. de Wecker has proposed to find an operation for the treatment of simple glaucoma, which would be to this lesion what iridectomy is to inflammatory glaucoma, and thus to complete in its generality the treatment of glaucoma.

The operation which he suggests is sclerotomy, and he enters into quite extensive details as to the manner of performing sclerotomy, as he has practised it; he does not conceal that this operation is quite a delicate one, that it necessitates a certain amount of experience, and he insists upon this essential point, that it ought always to be preceded by instillations of eserine.

Passing on to the results of the operation, M. de Wecker states that during the first six months of this year he has performed forty-eight operations of sclerotomy, and that he has had every reason to congratulate himself upon the results obtained.

Iridectomy diminished vision to a great degree; he has been fortunate in proving that this difficulty is considerably lessened by the employment of sclerotomy.

He acknowledges that the definitive sanction of this operation can only be found in a more protracted clinical observation; but he is happy to state that at present sclerotomy, although its application is so recent, has been practised and adopted by a relatively large number of foreign practitioners.

Foreign Body in the Base of the Orbit without Symptoms.

At a meeting of the Medical Society of Greifswald (*Deutsche Medicin Wochenschrift*, August 16th), Dr. SCHIRMER related a case in which a foreign body had remained five months in the orbit without producing remarkable disturbance. On February 20th, a soldier aged 25 came to the eye-clinic on account of entropium of the left lower eyelid; the middle part was specially affected, being turned inwards at an angle. The cause of this was apparent in the form of a cicatricial band extending from the edge of the lid to the lower fold; it implicated the conjunctiva and a portion of the tarsus, but left the cutis free. Another vertical cicatrix passed through the thickness of the whole upper eyelid, not quite reaching the edge. There was also a vertical cicatrix nearly an inch long on the forehead, reaching as far as the left eyebrow. In the previous October, during a fight, it was said, the patient had been wounded in the forehead and upper eyelid by a knife; but the eye had not been injured. These wounds were united by sutures; the injury of the lower lid was not noticed. The entropium had set in soon afterwards. On examination, it was found that the conjunctival cicatrix was firmly adherent to the base of the orbit; and it was hence supposed that the instrument which produced the injury had penetrated the antrum of Highmore, and had pushed a portion of the lower fold of conjunctiva into the opening of the bone; and that, perhaps, also a broken portion of the knife remained there. No foreign body, however, could be felt with certainty in the orbit. An incision about four-fifths of an inch long was made through the soft parts along the lower border of the orbit; and the floor of the orbit was explored with a blunt instrument as far as the cicatrix. At this part, there was found a broken piece of knife, with its back turned towards the border of the orbit, and its edge towards the eyeball. Some force was required in removing it. It was a piece of a knife, about an inch and one-third long and three-fifths of an inch wide. After its removal, the lower eyelid regained its normal position, and the patient was discharged completely cured.—*British Med. Journal*, Oct. 18, 1879.

Acute Purulent Catarrh of the Right Middle Ear.

The following interesting case is recorded by Dr. KRATZ in the *Berlin. Klin. Wochenschrift* for April 21st. The patient, a girl, aged 9, had always enjoyed good health till about a week before she was seen by the author. She was then suffering from purulent catarrh of the right middle ear; and, on examination, a small opening of the size of half a lentil could be detected between the incus and the lower portion of the tympanum. The mastoid region was tender to pressure and œdematous; the external meatus was inflamed; the tympanum red, flat, and much swollen. The whole meatus was filled with thick yellow pus. The glands about the ear were swollen; but the parotid was free. The patient had a slight angina and fever. Her power of hearing was much impaired on the right side. When spoken to in a very loud key, she could hear at the distance of about twenty inches; the ticking of a watch only when put close to her ear; but the sound produced by a tuning-fork was distinctly heard over the whole of the head. After the meatus had been well syringed and all the pus removed, the opening in the tympanum could distinctly be seen. On pressing slightly with the finger on the jugular vein of the same side, pus was very rapidly discharged through the opening, the discharge ceasing when pressure was removed. This phenomenon was repeatedly produced, not only on the same day, but several days successively. The origin of it remains unexplained, as, under normal conditions, the jugular vein does not communicate directly with the interior of the tympanum. The possibility of an abscess having formed on the vein and communicating with the tympanum must be excluded, as nothing in the state of the patient proved its existence; and, besides, the circumstance that the pus was only discharged by pressing on the vein would disprove such a supposition. Another explanation of the phenomenon was, that the perforation was either a congenital deficiency or caused by caries. Under such circumstances, pressure on the jugular vein would drive the blood upwards, cause the bulb of the vein to dilate, and thereby cause the pus which had accumulated in the tympanum to be discharged. Similar cases have been observed by several authors—Toynbee, von Tröltsch, Schwartz, etc. The author was of opinion that the aperture was congenital.—*British Med. Journal*, Sept. 27, 1879.

Depression of the Left Frontal Protuberance treated by Trephining.

Dr. Houillot publishes in the *Gazette Médicale de Strasbourg*, No. 1, 1879, the following case of injury to the brain, which was cured by trephining. The patient a farm-labourer, aged 28, had, in a fight, received a blow on the head with a cudgel, which stunned him for about a quarter of an hour. On the next day, he went to his work as usual, and worked for eight days, at the end of which time he fell down suddenly as if he had been shot, but got up again. From this time, he began to suffer from vertigo and somnolence. A careful examination was made, but nothing could be detected except slight paresis of the right arm and tremor. He vomited much during the day. A probe having been introduced into the oblique wound which he had on his forehead, it was found that the frontal bone was fractured and depressed. The patient was taken to the hospital, and it was decided to perform the operation at once. A cruciform incision of one and a half inches was made over the wound, and an opening measuring four-tenths of an inch in depth and one inch across was discovered. The fragments of bone having been removed by means of a hammer and chisel, a purulent collection was found beneath the dura mater. The latter was detached from the brain for a space of nearly two and a half inches, but had remained intact. The pulsations of the brain could be perceived. An antiseptic dressing was applied. There was almost no reaction; the temperature never rose beyond 98.6°; and the cerebral symptoms (cephalalgia, vomiting, slow utterance) disappeared almost immediately. The progress of cicatrization went on very rapidly; and the patient, who had been wounded on May 4th, was able to return to his work on June 14th.—*British Med. Journal*, Sept. 27, 1879.

Total Extirpation of the Parotid Gland.

In an interesting paper read before the Finland Medical Society (*Hospitals Tidende*, Jan. 1879), Professor Estlander stated that the entire parotid gland had rarely been removed. Though the operation has many opponents and is difficult, it is, nevertheless, necessary and proper in certain cases, notwithstanding the danger of wounding important nerves and vessels. Though the complications which sometimes accompany the operation are unpleasant, they are not so permanent as many suppose. Estlander has had some of the patients under observation for twenty years or more, and found their condition very much improved. Notwithstanding the fact that all the branches of the facial nerve are severed in the gland, the patient has a certain power of contraction in the sphincter muscles of that side. Tumours may be removed from this region just as well as from others. In performing the operation, it is recommended not to ligate the carotid primarily. The cutaneous incision should be made so as to prolong it, if necessary, and then ligate the arteries. By prolonging the incision farther downward than is actually necessary, the advantage is gained of rendering the lower border more free and accessible, so that the position of the carotid and its relation to the tumour may be ascertained. The capsule of the tumour should be protected, so that the latter may be removed as a whole. First loosen the tumour at its lower border and sides, and gradually work upward; the upper portion usually presents the greatest difficulty. The bleeding from the branches of the external carotid is about the same whether the carotid is ligated or not. It is usually found that a tumour which can only be removed at the commencement with the knife and scissors, is later more accessible, and can be loosened with the fingers and the handle of the scalpel, and without coming in collision with the carotid.—*New York Med. Journal*, Oct. 1879.

Surgical Treatment of Goître.

Dr. Wölfler, in speaking of the treatment of goître with subcutaneous injections of iodine, says (Langenbeck's *Archiv*, Bd. 24, Heft. 1) that favourable results have been obtained both in cases of simple hyperplasia, and of colloid degeneration. He illustrates his statement by a few cases from Billroth's clinic, and an experiment on a dog made by himself. The lobes of the thyroid gland of this dog had respectively attained the size of a goose's egg, and the author made ten injections of iodine into one of the lobes. The dog was killed at the end of a month, when the portion of the goître into which the injections had been made was found to have dwindled down to the size of a man's thumb; it consisted of connective tissue which no longer contained any colloid liquid. The peripheric part of the injected goître presented the same appearance as the lobe which had remained untouched; it consisted of large meshes of connective tissue, which contained colloid fluid. There were no traces of inflammation or hemorrhage following the injection of iodine. Several strumous cysts were treated in a different manner: one cyst with thin walls was absorbed after injections of iodine; two other cysts resisted this treatment. In two cases Billroth drained strumous cysts with antiseptic precautions. In one of these cases, the cure was speedily effected; in the other, the cyst was not wholly absorbed, as there were calcareous deposits in its walls. The sac was then opened and the contents removed, after which the patient, a woman aged 72, recovered. The author thinks that tapping the cyst and putting in a drainage tube ought to be done in cases where a cyst does not collapse immediately after being tapped, or in old people where the injection of iodine might be succeeded by a too strong reaction, but where extirpation of the goître might prove fatal. In the course of the last year, Billroth has extirpated goîtres in seven cases under antiseptic precautions, the results having each time been very favourable. In one of these cases the patient was suffering from malignant cystous papilloma; in another case the struma was of carcinomatous nature. All the wounds healed by first intention.—*London Med. Record*, Oct. 15, 1879.

A Case of Empyema in which Portions of the Ribs were Excised.

At a recent meeting of the Clinical Society of London (*Med. Times and Gazette*, Oct. 18, 1879) Dr. F. Taylor read a paper on this subject. The patient was a child, aged six, who was admitted into the Evelina Hospital in

January, 1877, with a history of acute pleurisy eleven weeks previously. The left chest was shrunken, and dull on percussion posteriorly, with deficient breath-sounds, and some crepitation at the base in front. The temperature was at first nearly normal, but after a time it fluctuated considerably, often rising in the evening to 103° Fahr. As this continued, and the physical signs were confined to the base of the left chest, this was explored on April 16, and pus was found. The chest was then incised, and about ten ounces of pus were discharged. Tubes were inserted, and the chest washed out daily. On May 20 a counter-opening had to be made, but by the end of June very little real progress had been made, as the sinuses rapidly closed, and thus the pus secreted was retained. On July 2, Mr. Howse made a T-shaped incision through the skin round the existing aperture, and after separating the periosteum, removed with the bone-forceps portions of the seventh, eighth, and ninth ribs. Each portion was about an inch and a half long. The thickened pleura was then cut through from the sinus, and two drainage-tubes were inserted. The immediate improvement was decided, but the wound rapidly filled up, and in a short time the sinus was reduced to a channel no bigger than it was previous to the operation. From this time nothing further was done by operation. The pus continued to be secreted, and its retention was quickly followed by hectic symptoms. Albuminuria was discovered in September, 1877, two months after the operation; anasarca developed later, and there was frequent diarrhœa, so that she sank from the internal complications in October, 1878. At the post-mortem examination the empyema was found to occupy chiefly the posterior part of the chest, reaching from base to apex. The lung was airless except at the apex. There was no tubercle. The sixth, seventh, and eighth ribs were united by bony bridges. The liver, kidneys, and intestines were lardaceous, and there was recent acute peritonitis. The operation performed in this case permitted more falling in of the chest than would have otherwise taken place, but did not facilitate the drainage so much as was desired. This was due to the rapid development of granulations and bone, which took place after the operation, the opening being quickly reduced to a narrow sinus. In another case it would probably be advisable to remove the periosteal tissue much more freely, even if it necessitated also the removal of the thickened pleura. The large opening thus obtained would also allow more complete exploration of the smaller cavities, apparently distinct from the main cavity, such as were found in this case at the time of the operation.

Total Unilateral Rupture of the Kidney.

Dr. **Anders**, in No. 50 of the *St. Petersburger Medicinische Wochenschrift*, gives the following account of an interesting case. The patient, aged 15, a well built and well nourished individual, fell from the second floor of a house to the ground, but was not rendered insensible. He said that he had first struck the ground with his feet and then with the right hip. No symptoms of external injury could, however, be seen, except a slightly purplish spot over the right trochanter. No fracture of any kind could be traced, neither was there any symptom of concussion of the brain or spinal cord. He could not walk very well, but was able to move his extremities freely when lying in bed. The pulse was small, 60. Sensibility was not decreased. He freely passed bloody urine. The patient complained of severe pain in the abdomen, especially in the left renal region, but nothing abnormal could be detected in that part, either on inspection or palpation. The epidermis, and those parts of the mucous membranes which were visible to the eye, were exceedingly pale. The urine, on being examined under the microscope, was found to contain a large number of red blood-corpuscles Towards night, the patient grew weaker, his abdomen was inflated, he frequently passed bloody urine, and complained of an increase of pain in the left lumbar region and the abdomen, especially if touched there. The symptoms of internal hemorrhage increased; he was a little delirious during the night. On the next morning, the mucous membrane seemed to be perfectly bloodless, while the skin was yellow. During the night, the urine was very little bloody, and on the morning quite clear. The patient died at 11 A.M. The treatment consisted in applying ice-bags to the abdomen and the lumbar region, and in giving several doses of morphia during the stage of prostration. At the necropsy, the thoracic viscera and the brain were found perfectly normal. On opening the abdominal cavity, several superficial subperitoneal extravasations, varying in size from a three penny-piece to a penny-piece, were seen, both on the visceral as well as the parietal peritoneum, especially in the portions which corresponded to the cæcum, descending colon, sigmoid flexure, and parts of the ileum. A dark blue tumour of the size of a child's head, extending from the iliac fossa to above the tenth rib, and covering the three superior lumbar vertebra, was found in the abdominal cavity. It consisted of coagulated blood, in which the kidney, which had been torn into two distinct halves, was found imbedded. The rupture was transverse, going from the anterior superior part of the organ to the posterior inferior, and extending over the capsule and the pulp. The pieces were about two inches distant from each other, and entirely separated from their adhesions. The ureter was torn off, and was attached, to the length of two inches, to the lower fragment; the renal vein and artery were in the same condition. The right kidney was perfectly sound. The peritoneum was not ruptured. No fluid was contained in the abdominal cavity, and no blood in the bladder. Dr. Anders remarks that this case belongs to a class of rupture of the kidneys which very seldom comes under observation. 1. All the other organs remaining unaffected, the left kidney only was the subject of an indirect injury. 2. Death was caused by acute anæmia, as shown by the large clot of blood which was found in the left renal region and the hæmaturia. 3. The vein, artery, and ureter, were all three divided. 4. The reason why no blood was passed with the urine in the morning is, probably, that the blood being still liquid for the first hours after the accident, flowed down the divided ureter into the bladder; but later on coagulating stopped it, so that the urine which was secreted by the right healthy kidney remained clear, and was passed as such.—*British Med. Journal*, Oct. 18, 1879.

The Stigmas of Maize in Disease of the Bladder.

Dr. DUFAU (*Le Progrès Médical*, July 19, 1879), believes that the introduction of the stigmas of maize into therapeutics is still too recent to afford sufficient material for the study of their mode of action. He puts forward, however, certain conclusions at which he has arrived, founded upon cases which have occurred in his own practice, as well as from the contributions of numerous friends. The stigmas of maize have a much greater influence in all diseases of the bladder, whether in cystitis, gravel, or any other case, when they are fresh than when they have been kept. In acute traumatic cystitis as well as in blennorrhagia, they exert a marked diuretic action, with an increase of the pain. In such cases, therefore, it is better not to make use of this drug. The best results from its use are obtained in the case of patients with gravel, either uric or phosphatic, or in those who are suffering from chronic cystitis, whether the disease is simple or is a result of gravel, and in mucous and muco-purulent catarrh of the bladder. Under the influence of the maize all the symptoms, such as vesical pain, difficulty in passing water, the excretion of dark-coloured urine, the ammoniacal odour, etc., rapidly disappear. The retention of urine frequently gives way to this mode of treatment, but the catheter should still occasionally be used, as the bottom of the bladder is not always completely emptied. Many of the patients under observation had previously employed the more usual remedies of tar, turpentine, and Vichy or other mineral waters, with varying results. The stigmas of maize often afforded relief where such means had failed. In some cases a certain improvement was effected by the methods alluded to, after which the condition of the patients remained stationary. The administration of the stigmas of maize produced in these cases either a cure, or a turn for the better, and induced a favourable action of the previous remedies. In other cases, however, these preparations which had been of no avail when first given, became efficacious after the ground, so to speak, had been cleared by the stigmas of maize. More generally, however, the maize alone was capable of effecting a cure. In some cases it is well to combine the maize treatment with the usual external applications; of these the irrigation of the bladder with a stream of water is very useful, but the best method is to inject various solutions, such as borax, tar, silicate of soda, or bicarbonate of soda if the urine is very acid, and benzoic acid if it is strongly alkaline, etc. The stigmas of maize act as very energetic but perfectly harmless diuretics in diseases of the heart, in albuminuria, and generally in all those cases in which an ordinary diuretic is required. In a number of cases the quantity of urine is increased three and even fivefold within the first twenty-four hours, and in other cases this drug has been employed for two months without accident. It is useful to remember this fact, as the diuretics in ordinary use, nitrate of potash, digitalis, squills, etc., are not always convenient, or free from danger. The mode of preparing the stigmas of maize, has been already described, but it is not perhaps sufficiently well known. The stigma as a decoction give the same results as the extract, but they are much less active and have an irregular action which is easy to explain. The plants are picked and dried under varying conditions, and they are sometimes even ground, hence the decoction varies in strength from day to day. The extract and syrup, however, having always the same composition, give constant results, and as the volume is less, a much larger dose of the drug can be administered. From an economical point of view it is best to give the syrup in the decoction of stigmas. It is in fact of great importance, as with all diuretics, to dilute the syrup with a certain quantity of water; the results obtained with the extract given in the form of a pill differ sensibly. The syrup, with a decoction or with water, forms a very pleasant drink, of which patients do not get tired. The drug should be taken fasting. Two or three teaspoonfuls of the syrup a day are generally sufficient.—*Practitioner*, October, 1879.

Radical Cure of Hydrocele.

Mr. Hillis having had much experience of the treatment of hydrocele in British Guiana, and having been disappointed with the results obtained by using iodine in the proportion of one of tincture to two or three parts of water, was induced to try the undiluted tincture of the *British Pharmacopœia.* Two to four drachms are thrown into the sac after tapping, and the sac gently manipulated for some time. Cases of previous failure, cured by this plan, are reported in order to impress upon the profession the real value of this old, yet often forgotten, suggestion.—*London Med. Record*, Oct. 15, 1879.

Hemorrhage from the Carotid Artery in a Case of Phlegmonous Tonsillitis.

Ehrmann reports (*Centralblatt für Chir.*, No. 34, 1879) the following instructive case:—

A young Italian entered the hospital with an *angina tonsillaris.* On the third day the abscess opened spontaneously, and immediately one half a litre of bright-red blood poured from the mouth. Three hours later the hemorrhage recurred, but in less quantity. No pulsation could be felt in the tonsillar tumour. A third hemorrhage, more severe than both of the preceding together, led to the ligature of the common carotid artery, which was then severed, between two double threads. The hemorrhage ceased. The patient presented no cerebral disturbance aside from a distinct aphonia, which disappeared in four days. In six weeks he was discharged cured.

Ehrmann completes his interesting and valuable essay with the following conclusions: 1. Phlegmonous inflammation of the tonsils can lead to abundant and spontaneous hemorrhage, an accident likewise occasionally caused by deep ulcerations. 2. In many instances the bleeding comes directly from the internal carotid, in occasional cases from branches of the external. 3. The diagnosis of erosion of an artery before opening of the tonsillar tumour is impossible. In occasional instances pulsation of the tumour has given warning before the incision was made; in others it was not distinguishable. The rational treatment of such a hemorrhage lies in the ligature of the carotid; and, as during life the source of the bleeding, whether from the internal or branches of the external carotid, cannot be determined, the common carotid is to be preferred. The original article contains a very useful *résumé* of the whole subject, with cases; views on the source of the hemorrhage in general diseases and local affections, which may lead to erosion of an artery; the cerebral disturbances, which may follow ligature of the common carotid, etc.—*New York Med. Journal*, Oct. 1879.

A Method for Controlling Hemorrhage during Amputation at the Hip-Joint.

The following might be found useful as a method for controlling hemorrhage during operation at the hip-joint. It was employed by Mr. Spence with complete success in a case reported (*Lancet*, Sept. 20, 1879) by Mr. R. PURDIE, Resident Surgeon, Edinburgh Royal Infirmary.

The patient was admitted into the Royal Infirmary in a very weak and debilitated condition, the history being that two years previously he had suffered from scarlet fever, and that during his convalescence he had neglected proper precautions against cold, etc. Abscesses formed at the hip, the leg became quite useless, and his health gradually became more impaired. During his journey here erysipelas of a phlegmonous nature developed itself, lasting for some weeks, and leaving the whole leg in a swollen, œdematous, deformed mass, with sinuses leading down to the joint, which was in a state of firm fibrinous anchylosis.

Mr. Spence, though unwilling to perform any operation, owing to the patient's condition, yet, considering it was his only chance for life, resolved to amputate, using the following method, in order the more completely to control the hemorrhage. The sinuses which were at the outer side of the limb were connected by an incision. The head of the femur was cut down upon, and, with difficulty, owing to the anchylosis which had taken place, was excised. The thigh was then transfixed by a long sharp-pointed steel skewer, three-eighths of an inch in breadth, the point entering at the incision which has just been made, and then taking the course which the knife usually takes in transfixion for the anterior flap. A firm india-rubber band was then twisted tightly round the skewer, including the anterior part of the thigh, much after the method in which vessels are secured by acupressure. Another band was twisted round posteriorly, thus securing the posterior vessels. The operation was then completed by cutting the anterior and posterior flaps. After the vessels were secured the bands were loosened, the skewer removed, and the flaps stitched and dressed. During the excision a small quantity of blood was lost, but during the after-part of the operation scarcely a drop.

Mr. Spence remarked to the students after the operation that this method was most advantageous in cases such as the preceding, where a comparatively firm anchylosis had taken place, or in cases where the shaft has become separated at the trochanters by diseased action, great difficulty being found in removing the head of the femur, and the operation thus prolonged. In cases where none of these difficulties are met with, this method is not so necessary, as the leg can be removed with great rapidity, and the vessels grasped in the hand after the flaps are cut, so that no great amount of blood need be lost, the rapidity of the operation diminishing also the amount of shock.

Outbreak of Eczema on Amputated Stumps.

At a recent meeting of the Société de Chirurgie de Paris, M. DUPLAY said (*Bull. Gen. de Thérap.*) that he had seen two cases of an acute eczema breaking out on the extremity of amputated stumps. One case was that of a man who had had his arm amputated for phlegmon of the tendon sheaths and suppurated arthritis; the other patient had had his leg amputated for fracture. Neither of them had suffered before from arthritis or herpetic affections. Neither had there been any other inflammatory phenomenon on the extremity of the stump. In both cases the eczemata healed within six months. This eruption appears to be caused by a neuritis of the nerves of the stump, and ought to be considered as an affection of the trophic centres, though the real cause of it is still unknown to us. The affection in itself is not dangerous, but tedious, because it prevents the application of a prothetic apparatus. The treatment is the same as in ordinary eczemata, and the affection may be said to heal of its own account.—*Lond. Med. Record*, Oct. 15, 1879.

Spontaneous Anterior Subluxation of the Hand.

Dr. MADELUNG publishes, in von Langenbeck's *Archiv* (vol. xxiii), a report of twelve cases of this affection which have come under his notice. In one of the cases, he was able to make a thorough anatomical examination. The upper border of the articular surface of the radius had degenerated into a tuberosity, which prevented the carpus from assuming its normal position; the epiphysis of the radius was considerably inclined towards the volar surface. There were no signs of inflammation. The author regards this deformity as dependent on an arrest in the growth of the wrist-joint, and as being analogous to talipes valgus and genu valgum, which are caused by excess of weight pressing on the lower extremities. This spontaneous subluxation is most frequently met with in the age between thirteen and twenty-three, and in females belonging to the working-classes, especially laundresses. The movements of the joints are limited to a certain extent by the arrangement of the bones, the ligament, and the muscles. The latter are of special importance for the movements of the wrist-joint. The manual labour of daily life is almost entirely executed by the pronator muscles. Excess of flexion on the palmar surface is prevented by the tendons which run across the epiphysis of the radius, and, in arduous manual labour, exercise a constant pressure on the bone. When this muscular apparatus is unable from exhaustion to discharge its functions any longer, the bones and ligaments take its place; and thus gradually the excessive pressure on one part of the articular surface of the radial epiphysis arrests its further growth, and favours the excessive development of those parts which are not subject to pressure. This deformity of the articular surfaces is always accompanied by pain in the affected joint, which has often been erroneously ascribed to neurosis. If the patient continue to work as before, subluxation of the joint ensues, the pain ceases, and the wrist-joint becomes deformed and much limited in its movements. When the affection is fully developed, it becomes incurable; but it may be arrested by carefully avoiding all labours which entail a forced dorsal flexion, and by wearing a broad leather strap which fits tightly to the joint, can be made tight or loose according to the wearer's will, and prevents the articulation from executing excessive movements.—*British Med. Journal*, Oct. 18, 1879.

—

Excision of the Elbow.

Prof. OLLIER, of Lyons, in a paper read at the Montpellier Congress (*Gaz. Hebd.*, Sept. 12), observed that at the commencement of his practice he performed this operation only exceptionally; but having recognized its value he finds that his results are much more satisfactory than formerly—a fact which he thinks attributable not only to improvements in operating, but especially to improvements in dressing. In spite of the great success which he has obtained, this operation is still practised but little in France, while abroad, especially in Germany, it is perhaps too frequently resorted to. In very young children Prof. Ollier very rarely performs excision, nature presenting great resources at this age, so that by the aid of a good hygiene, a tonic diet, immobilization, and ignipuncture, arthritis of the elbow may be rapidly and completely cured. In the second stage of childhood and in adolescence it should be practised at an early period, as the cure is then rapid and the reproduction of an articulation of the same type usually takes place, the patient preserving a vigorous limb. Beyond twenty Prof. Ollier seldom performs the operation, a useful limb rarely being produced after this age.—*Med. Times and Gazette*, Oct. 4, 1879.

—

Subperiosteal Excision of Elbow.

At a late meeting of the New York Pathological Society (*Medical Record*, Oct. 25, 1879), Dr. LANGE exhibited a patient upon whom he had performed subperiosteal excision of the right elbow-joint, after Prof. Voight's method, and gave the following history: Patient was nineteen years of age, and had a stiff right elbow from his early childhood. He knew nothing about the cause of this trouble. The arm remained thin and powerless, and any exercising caused pain in the joint, especially during the last two years. Various methods of treament were employed but without avail, and the patient finally resolved to get rid of his trouble by an operation.

At that time the patient was in good health. The right elbow was anchylosed at an angle of 90°, with a mobility of nearly 10°. The tissues about the joint were somewhat thickened, but no fistula or other indication of existing suppuration was present. The olecranon and head of the radius seemed thickened, and they were very painful on pressure, showing chronic ostitis. The operation was performed on the 25th of June by means of a bilateral incision, antiseptically made without spray, and by the bloodless method. The periosteum was carefully preserved; in all those places where important tendons or ligaments had their insertion (olecranon, coronoid process, epicondyles of humerus, etc.), thin layers of bone were separated by means of hammer and chisel, and remained in connection with the periosteum, according to the plan of Voight.

The operation was somewhat tedious and difficult, the periosteum being thickened and tense, and all recesses of the joint obliterated. Lister's gauze dressing was applied. The after-treatment consisted of a dorsal splint of plaster-of-Paris, with elevated position and slight extension. The position of the arm was about 150°. After the tenth day position was changed every second day to the extent of from 75° to 150°. At the end of the third week, articulated silicate dressings (with shoulder piece), which had a movable joint and rubber strips, were applied corresponding to the new joint. The joint allowed a slipping of the bones of the forearm upward and backward, according to the physiological position of the ulna. Active and passive movement were freely practised by causing the patient to lift a box filled with sand, the amount of which was increased every day. These exercises effected a stretching of the elbow. The arm, by means of the strip, was held in a right angle. The weight of the sand was chosen always a little beyond the strength of the patient to master it, so that it slowly extended the arm, the patient endeavouring to prevent this, and struggling against the weight by the power of his muscles. The rubber strips kept up a passive dragging of the ligaments and held the bones in a certain adaptation.

After the seventh week the apparatus could be omitted, the new formation of the bones being very significant, and almost complete cicatrization had been complete at end of fifth week. There had not been any significant discharge since the second week, only those places discharging superficially where the drainage-tube had been introduced.

The reaction after the incision had been quite insignificant. A bloody infiltration of the arm and forearm disappeared under the physiological changes of colour, and was reabsorbed without interfering with the healing process.

When the patient was exhibited to the Society, just three months after the operation, the elbow presented nearly its abnormal shape. Motion was between [illegible] and almost 180 degrees, without any abnormal lateral movability. The condyles of humerus appeared stronger than normal. Pro- and supination almost normal (had been exercised also methodically every day, the apparatus being removed for this purpose). The head of the radius was well marked, and normally faced the external condyle. The olecranon was distinctly formed, but was a little smaller than normal. Above its apex something like a sesamoid bone could be felt in the triceps tendon. The arm was so strong that the patient was able to lift a chair, seizing it by the leg, and after stretching the arm he held the chair a good while in the air. The flexion to an acute angle was difficult. The specimen showed deep depressions in the articular part of the ulna, especially one behind the base of the coronoid process. Its walls were hard and smooth; they were covered by a dense fibrous tissue which surrounded a small quantity of cheesy matter. All the depressions in the bone were filled with a succulent fibrous tissue, which sent vascularized adhesions to the opposite cartilage; so the process was on its way to cicatrization. The bones of the humerus were almost normal; cartilage of radius showed some cicatricial depressions; its head had an abnormal process towards the articulation, with the ulna, which was entirely obliterated by a dense fibrous mass.

The Rapid Treatment of Club-foot.

Mr. H. A. **Reeves**, Surgeon to the East London Hospital for Children, describes (*Med. Times and Gaz.*, Oct. 25, 1879) his method of treating club-foot, which is applicable to the large majority of congenital or acquired deformities of the feet; but the milder cases—those in which slight pressure will bring the foot into the normal position, and in which the rebound on relaxing the grasp is very slight—can, with patience, be cured without operation.

The patient being held by a nurse or assistant, and the foot being in the right position, the tendons of the tibialis posticus and flexor longus digitorum are first divided, and a pad and strip of adhesive plaster applied. Then the tendon of the tibialis anticus is divided, and a pad put on. Immediately after the tenotomies, the foot is forcibly but steadily brought into its right position, and kept there by an assistant while a flannel bandage is put on. Over this is put a plaster-of-Paris bandage, then a thin layer of plaster paste, and finally another bandage and more paste. Sometimes a third plaster bandage is necessary, but in infants and children it may be dispensed with. Of course, the bandages must not be too tightly applied, and it is well to protect the bony prominences with a little cotton-wool. The foot is held in position until the plaster has set; and instructions are given to the parents to bring the child at once to be seen, or they are told how to loosen or remove the bandage should the toes become cold and purple.

If the inner part of the plantar fascia be tense and interfere with the straightening of the foot, Mr. Reeves divides it first, forcibly stretches it, and at once thereafter divide the tibials and flexor longus digitorum. He adopts this plan, which differs from that usually recommended, so that the uncut tendons may resist him, and thus enable the anterior part of the foot to be more successfully abducted. In most instances he leaves the foot in the plaster case for a week; but in the more severe cases ten days to a fortnight are necessary. At the expiration of this time the bandage is removed, and the foot will be seen to have assumed its proper position. It is then well worked (*i. e.*, abducted), afterwards the tendo Achillis is divided, and the heel firmly but gently brought down. The pad and bandages are put on while the foot is held in the corrected position, the toes being left free, but the heel covered. Another week or ten days usually suffices by this method to bring the deformed foot into its normal position, and then the bandage is removed by cutting it in the mid-line, along the anterior aspect of the foot and leg. The foot is then well worked in the desired directions and the leg-muscles shampooed. The mother sees how this is done, so that she or her husband may occasionally do it at home, and the child is brought once a week to be seen by the surgeon.

If the child be old enough to walk, it is measured for a proper boot and support at the commencement of the treatment, and in most cases in three weeks after the first operation it is allowed to walk. The foot is well worked night and morning, and the second plaster bandage is put on at bedtime and retained in position by an ordinary roller. This is ordered to be continued for several weeks in order to prevent a relapse. Except in very severe cases an anæsthetic is unnecessary, but in private practice, should it be desired to prevent the child crying, it may be given.

Mr. Reeves has now had considerable experience in this as well as in the ordinary modes of treating club-feet, and so far has never had a relapse if the instructions have been properly carried out. He can therefore confidently recommend it to surgeons interested in such matters.

The advantages of the method proposed are briefly the following:—1. The results are rapid and satisfactory. 2. Expensive apparatus is unnecessary. 3. The muscles, joints, etc., are worked and exercised, and not allowed to atrophy or become temporarily fixed, as in the German method; and, 4. The patient, in ordinary cases, may be allowed to use the foot or to walk in three weeks after the first tenotomy.

Traumatic Tetanus: Different Methods of Treatment.

Dr. MOLLIÈRE relates the following case in the *Gazette des Hôpitaux*. The patient, aged 25, had been accidentally shot in the right foot. The fourth and fifth toes were so badly injured that they were amputated at once; the first phalanx of the third was fractured and the articulation opened, but it was thought that it might be preserved. The patient was treated antiseptically, and seemed to progress well during a fortnight, when suddenly he began to complain of a feeling of lassitude, the wound became very painful, and he experienced some difficulty in opening his jaws and turning his head. The toes were dressed with laudanum, and the patient took half a drachm of bromide of potassium and a drachm and a half of chloral daily; he had also two hypodermic injections of morphia. Notwithstanding this treatment, the patient became worse, the pain in the foot increased, and all the symptoms of acute tetanus showed themselves; he had general convulsions, could not move his head or open his mouth, perspired abundantly, had very high temperature, etc. The wound becoming exceedingly painful, the injured toe was amputated. From that day the local pain ceased, and the other symptoms gradually vanished. The patient remained sleepless for a rather long time, notwithstanding the use of hypnotics, but could open his mouth more freely, and could swallow. Smaller doses of chloral and bromide of potassium were given, and a month after the operation the patient was well enough to leave the hospital. On dissecting the toe which had been removed, it was found that a small sharp fragment of bone was sticking in the internal lateral nerve, and had in this way caused the tetanic convulsions. This case is remarkable on account of the different methods of treating tetanus having been combined in the treatment. Without the amputation, the drugs given would have had no effect; but on the other hand, if the powerful doses of hypnotics had not been administered, the surgical treatment would, in the author's opinion, have proved useless.—*British Med. Journal*, Oct. 18, 1879.

Supra-orbital Neuralgia cured by Nerve-stretching.

Dr. **Kocher** relates, in the *Correspondenzblatt für Schweizer Aerzte*, November 11th, 1879, the case of a man aged 32, who had for seventeen years suffered from neuralgia of the right supra-orbital nerve. The attacks, at first rare, afterwards became more frequent, until at last there were only brief intervals of freedom from pain. All the ordinary therapeutic measures had been tried for years without success. Dr. Kocher laid bare the nerve and three of its branches by an incision along the upper border of the orbit, and stretched it forcibly by means of an aneurism-needle passed under it. The healing of the wound was attended with abundant suppuration. From the moment of the operation, the patient was free from pain, and the neighbourhood of the supra-orbital nerve was anæsthetic. The patient was last seen three months after the operation; he had had no return of the pain; sensation was diminished over a space ten *centimètres* in extent, but was otherwise perfectly restored. After neurectomy, paroxysms of pain are usually observed during the first few days after the operation. As these were absent in the present case, Dr. Kocher concludes that the lesion of the nerve is less when the nerve is stretched than when it is divided. The value of nerve-stretching as a substitute for excision will be greater in neuralgia of the second and third divisions of the fifth nerve, as here a much smaller wound will suffice.—*British Med. Journal*, Oct. 18, 1879.

Midwifery and Gynæcology.

Double Uterus with Double Conception.

Dr. **Sotschawa**, of Moscow, reports in the St. Petersburg *Med. Woch.*, Jan. 1879, the case of a woman, aged 26 years, who called him on account of a hemorrhage occurring during a third pregnancy. On examination he found two distinct vaginas, each one terminating in a uterus. The finger passed readily through the first of these, and he found an ovum presenting; the uterus seemed to correspond to about the second month of conception. The vagina of tne other side (right) was narrower, but the neck could be reached, and appeared to belong to a uterus of three months. The hemorrhage had its source in both uteri, and in consequence was considerable; an embryo of one month was extracted with the finger from the left uterus, and three days later a fœtus of three months was extracted from the right uterus. The author observes that this case is not only remarkable for its rarity (only thirty cases being on record) but also because it is a proof of the possibility of superfœtation.—*Chicago Med. Journ.*, Nov. 1879.

The Condition of the Cervix Uteri in Cases of Placenta Prævia.

Dr. **George Roper**, Physician to the Royal Maternity, London, calls attention (*Lancet*, Oct. 25, 1879) to a hitherto unrecorded fact, which consists in a peculiar induration of the os or cervix uteri, at the site of placental attachment, dependent on an alteration of the uterine texture of that part on which the placenta is implanted. From clinical observation it may be said, that wherever the placenta grows, whether on the fundus or elsewhere on the inner uterine surface, the area of attachment is marked by induration and thickening of the uterine tissue, and in Dr. Roper's experience the induration has constituted one of the greatest difficulties in the way of safely effecting forced delivery.

If we have to deal with a case of placenta prævia in which the placenta is centrally placed, then there is induration in the entire circumference of the inner os; if with one of a partial kind, then we have a demonstrative proof, in that we are able to compare that part of the os internum to which the placenta is attached, with that portion to which it is not attached; the former will be found indurated and unyielding, the latter soft and elastic.

Dr. Roper does not wish to be understood as overlooking the undeveloped state of the lower part of the uterus in these cases, occurring as they mostly do before full term; and in speaking of the os or cervix uteri, he means the os or margin of the orifice of the uterus proper. A great distinction is to be drawn between the os internum, which is firm and thick, and the thin flabby cervix with its soft outer os.

The limits of Dr. Roper's paper did not permit him to dwell on the importance of this condition in reference both to the treatment of placenta prævia and its prognosis after forced delivery.

Ovarian Pain in Pregnant Women.

It is well known that, in examining pregnant women and trying to ascertatn the position of the fœtus by abdominal palpation, the accoucheur will sometimes hit upon a spot which is so tender that a very slight pressure is apt to produce very severe pain. Dr. **Budin's** attention having been drawn to the subject, he has studied it carefully, and has come to the following conclusions (*Progrès Médical*, March 1, 1879). The pain is limited to one particular spot, and has never, with one exception, been known to appear spontaneously, but is always caused by external pressure. On a level with the spot, a small body can be felt moving about under the exploring finger; it is of ovoid form, generally of the size of an olive, and can be moved transversely, though not up and down. If we draw an ideal line from the navel to the anterior superior iliac spine, we find this object either above or under or on the line itself. Dr. Budin thinks it the ovary. In following the back of the fœtus with our finger, we easily provoke the pain and find the ovary. In other cases, it could only be felt rolling under the finger when the uterus was contracted. The contraction having once ceased, it was very difficult to find it again. The left ovary seems to be much more tender to the touch than the right one; the pain is also generally prevalent on the same side. This is probably owing to the position of the fœtus, which lies generally with its back turned to the left and forwards. In two cases, however, where the child's back was turned to the right, the right ovary was painful. It is not yet decided whether this ovarian pain is spontaneously provoked during labour, and whether it can be produced after the ovum is expelled. It is also possible that ovarian pain has been mistaken for a peculiar form of neuralgia which has been called by several authors rheumatism of the uterus, or for the pain which is often caused by the head pressing on the uterine wall. Not one of the women in whom this phenomenon has been noticed was hysterical, so that evidently the pain could only be attributed to the compression of the ovary.—*Brit. Med. Journ.*, Sept. 27, 1879.

The Treatment of Abortion.

Dr. J. Veit is the author of an interesting paper in the *Zeitschrift für Geburtshülfe und Gynäkologie*, Bd. iv. 163, upon the treatment of abortion. In it the views lately promulgated on that subject by Fehling in the *Archiv für Gynäkologie* are discussed and disputed. Dr. J. Veit regards the methods of interference recommended by Fehling as too active, and would recommend a more expectant treatment in the majority of cases, contenting himself with careful plugging of the vagina when there was hemorrhage of a severe kind and waiting, thus avoiding forcible dilatation, incision of the cervix, or the use of the curette. He urges strongly that in estimating the results of treatment in abortion we must not forget those inseparable from the operative measures we employ to end it. The author, however, recommends active measures to empty the uterus in such cases of delayed abortion as threaten danger to the mother from absorption of putrescent portions of the ovum or of its envelopes. An account of two such cases is given, where the author was led to hurry the expulsion of the contents of the uterus on the sudden occurrence of rigor and high fever. Temperature 105°. Both cases were successful. J. Veit endeavours to show that the menorrhagia, so frequently met with after abortion, is not necessarily due to any portion of the placenta having been retained, but to alteration in the growth of the mucous membrane dependent upon imperfect involution of the uterus. He enters his protest against the use of the sharp curette for removal of retained portions of membrane, recommended by Böter and others, as being unnecessarily dangerous.—*Edinburgh Med. Journal*, Sept. 1879.

The Causation of Sterility.

Dr. Levy, of Munich, gives (*Bair. Ärztl. Intell. Blatt.*, 1879, Nos. 1 and 2) the results of microscopic examinations as to the condition of the spermatozoa at different intervals after coitus, in the case of sixty women who were under treatment for sterility. In fifty-seven out of the sixty, catarrh of the uterus was present. In all these cases only a small number of spermatozoa could be detected within the uterus, and they had all become motionless at the interval of, at the outside, five hours after coitus. In healthy women, on the other hand, the author found that the movements of the spermatozoa within the uterus continued for at least twenty-six hours. Thus the important effect of an altered character of the uterine secretion, in its destructive influence upon the spermatozoa, is demonstrated. The author believes that when the secretion is healthy the spermatozoa can make their way into the uterus in spite of flexions or stenosis. He draws the inference with respect to the use of tents or mechanical dilators for the cure of sterility, that, since these measures are liable to set up uterine catarrh, anti-catarrhal remedies must afterwards be used if the dilatation is to have any effect in promoting conception.—*Obstetrical Journ. of Great Britain*, Oct. 1879.

Elephantiasis of the Labium Majus.

Dr. **Axel Key** and M. **Asplund** describe in the *Svenska läkaresallskapets förhandlingar* (quoted in *Nordiskt Medicinskt Archiv*, Band xi) a case in which the latter removed from the right labium majus of a girl aged 21 a tumour weighing about ten *kilogrammes* (twenty-two pounds). It had a pedicle nearly six inches in diameter, and reached below the patient's knee when in the recumbent position. Its growths had been very rapid. The patient had also a sort of elephantiasis of the sole of the right foot and considerable swellings on the left leg and thigh. The tumour, which was twenty inches long, was uniformly long and soft, without any hard portions. On section, it was seen to be of uniform structure throughout, with a pale whitish-gray colour and watery appearance. On pressure, a large quantity of nearly clear very gelatinous fluid escaped. Microscopic examination showed that the tumour was composed of perfectly developed connective tissue, with small lymph-spaces externally and very large ones internally. This was then a pure case of elephantiasis of the female genital organs; and Key considers the enormous swelling as a very rare specimen of the disease in these parts. It is interesting to observe that it was not alone, but that, as has already been stated, the thigh, leg, and foot were also affected.—*Brit. Med. Journ.*, Sept. 27, 1879.

Vaginismus.

M. **Gallard**, in the *Annales de Gynecologie* states that he constantly recommends the gradual dilatation of the vagina by tents of progressively increasing size. According to the circumstances of the case he impregnates these tents with different applications. He also believes that these topical applications aid materially in curing vaginismus. For this purpose M. Gallard recommends the use of iodoform made up into an ointment (iodoform, 2 grams, cocoa butter, 2 grams, fresh lard, 15 grams). This preparation may be employed when there is redness or excoriation of the mucous membrane. If there is only pain without any visible change in the mucous membrane, extract of belladonna, 2 grams, fresh lard, 15 grams, may be prescribed. In this, as in the previous case, the tents may be as small as possible. After the employment of the iodoform ointment it is well to replace it after a few days, when the redness and excoriations have disappeared, by the belladonna preparation. In both cases care should be taken to increase daily, by an imperceptible but still advancing gradation, the size of the tent. By this means at no very distant period, a tent is habitually employed which is of such a size as to allow the introduction of the male organ. In effecting this result the action of the narcotic substance and the progressive dilatation have both materially assisted each other.—*Practitioner*, October, 1879, from *Journ. de Med. et Chir.*, May, 1879.

Hysterotomy for Fibrous Tumour of the Uterus.

M. **Tillaux** (*Gazette Hebd.* Oct. 17, 1879) in presenting to the Académie de Médécine a patient upon whom he had performed gastrotomy and ablation of the uterus referred to the fact that, some years ago Demarquay had said before this same tribunal that hysterotomy as applied to fibromas was not a justifiable operation, and ought to be condemned. M. Tillaux said the Académie ought not to remain under the impression caused by Demarquay's words. The case which he reported proves that a large proportion can escape certain death by means of hysterotomy, or, as he proposes to call it, hysterectomy.

The conditions in which this operation should be performed, he defined to be—

1. When the woman's life is threatened by obstinate hemorrhages—these are the most common cases.

2. When the tumour causes intolerable pain, and the patients themselves demand the operation.

3. Finally, when the tumour presses upon a portion of the intestine to the point of producing intestinal occlusion—these are the rarest cases.

M. Tillaux's patient was thirty-six years old. After having spent two months at Lariboisierè, and having gone from hospital to hospital, she returned to Beaujon the fifth of last March to seek an operation. She had a voluminous fibroma, which caused a constant drain, and had reduced her to the last stages of cachexia. The tumour was rounded, partially movable, and left no doubts in regard to the diagnosis. The operation was performed 18th of April, in an isolated pavilion of the Beaujon Hospital. The incision was made on the median line. The tumour presented some adhesions, due to anterior pelvi-peritonitis, which were easily detached by the hand. The Fallopian tubes were cut, after having been tied with catgut. The tumour was then turned out of the abdominal cavity on to the mons veneris. M. Tillaux transfixed the tumour in its lower part with a needle threaded with iron wire, and thus strangulated it with a double ligature. The uterine and fibrous mass was then separated with the bistoury above the ligature. The pedicle, which was very large, was left at the lower angle of the wound. Lister's antiseptic dressing was employed. There was no accident. The needle was drawn out on the twentieth day, and the cure took place slowly, but without interruption.

In this case M. Tillaux did not judge it necessary to remove the ovaries which he had not found in his way. The tumour was submucous, and weighed about 4½ pounds. It was developed in the uterine walls on the left side.

M. Tillaux remarked that the term hysterotomy as applied to this operation is not correct. We should say hysterectomy, when complete removal of the uterus takes place, just as we say iridectomy when the iris is removed. Hysterotomy would simply mean incision, and not removal of the uterus, and could be applied to fibrous tumours when we merely remove the fibroma, leaving the organ.

M. Guérin asked if the woman has continued to menstruate, and if she has had sexual relations. M. Tillaux replied that menstruation has taken place regularly during the past three months, but he knew nothing in regard to sexual relations.

At the succeeding meeting of the Académie (*ibid.*, Oct. 24, 1879) M. Duplay reported two cases in which he had performed hysterotomy and declared himself an earnest advocate of this operation in the treatment of fibromas or cysto-fibromas of the uterus. The first operations performed were, he said, after errors of diagnosis on the part of surgeons who thought they had ovarian tumours to deal with. Kimball appears to be the first surgeon who deliberately undertook in 1853 the removal of the uterus for a fibroma. His example was followed later, and observations on hysterotomy have increased during the past fifteen years. In France, however, this operation has been looked upon with little favour, and has not been performed with much success, except by Messrs. Kœberlé and Péan. The greatest number of operations have been performed elsewhere.

M Duplay collected some statistics of laparotomies performed up to last year. 1. for fibromas. 2. for fibro-cystic tumours.

1. Laparotomies for fibromas—*a*. Removing the fibroma and leaving the uterus. Sub-peritoneal tumours, more or less pedunculated: 17 laparotomies, 5 cures, 12 deaths, or 70.5 per cent. mortality. *b*. Removing the entire uterus: 55 laparotomies, 23 cures, 32 deaths, or 58 per cent. mortality.

2. Laparotomies for cysto-fibromas: 41 laparotomies, 22 cures, 19 deaths, or 46.4 per cent. mortality. These partial statistics would seem to prove that hys-

terotomy is less serious for cysto-fibromas than for pure fibromas. If the partial statistics are united we find: of 113 laparotomies and hysterotomies, 50 cures, 63 deaths, or 44.2 per cent. cures and 55.7 per cent. deaths.

M. Duplay afterwards gave an account of the two operations of hysterotomy that he performed for uterine fibromas, one of which, in 1876, was at the hospital of Saint-Louis, and was followed by death, and the other on the 15th of last August, was in an insane asylum, and was followed by a cure, although M. Duplay had not thought it necessary to take the precautions taught by the advocates of the antiseptic method. In this last case the tumour was a solid uterine fibroma, and weighed 22 pounds.

An Aid to the Diagnosis of Large Ovarian Tumours.

Dr. SCHULTZE, of Jena, describes (*Centralblätt für Gynäkologie*, No. 6, 1878) a method of manipulation which he thinks will be of advantage, in addition to those generally described, in the diagnosis of ovarian tumours, and more especially in discovering the nature of their attachment, and in determining the possibility of extirpating them. He first expresses his approval of the manœuvre recommended by Hegar—namely, that the cervix should be seized by a tenaculum and drawn down by an assistant, thus putting the pedicle of the tumour on the stretch, while the bimanual examination is carried out by two fingers of one hand in the rectum and the other hand externally. For the author's special method of exploration the patient is to be placed in the dorsal position on a table, with her hips close to the end, and to be brought under deep anæsthesia. The rectum is then to be explored by two fingers, while an assistant, standing at the other side, grasps the tumour with both hands, and alternately draws it upwards and presses it downwards, causing it to glide, if possible, beneath the abdominal walls. The pedicle or attachment to the uterus is thus alternately put on the stretch, and released to the greatest degree, so that the fingers in the rectum can distinguish it with the greatest ease from any other source of resistance to pressure against the rectal walls. The author considers that the introduction of the half or whole hand into the rectum stretches its walls so much as to render more difficult the appreciation of any resistance felt through them.—*Obstetrical Journal of Great Britain*, Oct. 1879.

Medical Jurisprudence and Toxicology.

Toxic Effects of Tea.

At the late meeting of the American Neurological Association (*Journal of Nervous and Mental Diseases*, Oct. 1879), Dr. W. J. MORTON, of New York, read a paper upon this subject, which, he said, was best studied by examining that class of men, such as tea-tasters, who habitually took tea in large amounts. It was, however, not easy to obtain extensive data concerning those men, for they feared if the facts became known it might injure their business. Five cases, however, had been collected, and those, together with experiments performed by the writer upon himself, formed the basis of the paper.

The bad effects of tea-tasting were known and recognized by the tea-tasters themselves, and few could carry on the business many years without breaking down. One tea-taster estimated that he got about half-a-pound of tea into his system during a day. It has been said that the symptoms from which tea-tasters suffered were due to alcohol or dyspepsia, but the facts collected showed the contrary.

The writer then gave the history of the cases referred to, and of the experiments upon himself.

The following is a *résumé:* First, as to the immediate effects of moderate doses, there was in the cases observed: an elevation of pulse, increase of respiration, agreeable exhilaration of mind and body, a feeling of contentment and placidity, an increase of intellectual and physical vigour, with no noticeable reaction.

The immediate effects of an excessive dose were: rapid elevation of pulse, marked increase of respiration to the extent of about one-third, increase of temperature, no period of exhilaration, but immediate and severe headache, dimness of vision, ringing in the ears, dulness and confusion of ideas. Following that was a severe reaction: exhaustion of mind and body, tremulousness and "nervousness," and dread of impending harm, that could not be relieved by taking more tea.

The effects of continued doses were a continuance of the tremulousness, extreme susceptibility to outside impressions, constipation, diminution of urine, and marked influence on the metamorphosis of tissue as shown by the diminution in the amount of urea. Thus, in the week during which the writer was taking toxic doses of tea, the amount of urine fell from f. ℥xl to f. ℥xxxii per day; and in the same time the urea fell from gr. 591 to gr. 422 per day. The sulphates, phosphates, and chlorides were increased.

The results, as regarded the diminution of urea, agreed with previous experiments, but showed the influence of the tea much more strikingly.

From the study of the drug's action, Dr. Morton arrived at the following conclusions:—

1. That with it, as with any other potent drug, there was a proper and an improper use of it.
2. That in moderation it was a mild and pleasant stimulant, followed by no harmful reaction.
3. Its continued and immoderate use led to a very serious group of symptoms, such as headache, vertigo, ringing in the ears, tremulousness, "nervousness," exhaustion of mind and body, with disinclination to mental and physical exertion, increased and irregular action of the heart, and dyspepsia.
4. The mental symptoms were not to be attributed to dyspepsia.
5. It diminished the amount of urine, and retarded the metamorphosis of tissue.
6. Many of the symptoms of immoderate tea-drinking were such as might occur without a suspicion of the real cause.

Nitrite of Amyl in Chloral Poisoning.

Dr. J. G. S. Coghill (*Brit. Med. Journ.*, June, 1879, p. 969) was called to see a man, aged 62, who, two hours after taking a large dose (quantity uncertain) of chloral, was gasping, with four respirations a minute, kept up by artificial respiration. The surface was cold, deeply cyanosed, with the pupils contracted to the size of a pin's head. The pulse was 80, full, soft and compressible. Twenty drops of nitrite of amyl were administered by inhalation. Within two minutes warmth had returned, even to the extremities, and the surface had resumed the hue of health. In ten minutes the respirations reached nine per minute, and gradually rose to twelve. The amyl was repeated in a smaller dose, after an interval of two hours. On the following morning, at 9.30, about twelve hours after the chloral was taken, although the patient was generally much improved, still there was no return of consciousness, but after two brandy and beef-tea enemata, he became quite sensible and spoke to those around, and swallowed food. At 6.30 P. M. the patient was improved, and continued to do so till 9 P. M., when he started up suddenly from sleep, stared around, threw up his hands, and, with a cry, fell back dead. Dr. Coghill thinks a more copious stimulation, per anum, might have warded off the fatal results due to cardiac syncope.—*London Med. Record*, Oct. 15, 1879.

Hygiene.

The Hygiene of the School Room in its Relation to Sight.

At a late meeting of the Société de Biologie (*Gazette Hebdomadaire*, Oct. 17, 1879) Dr. JAVAL, Director of the Laboratory of Ophthalmology at the Sorbonne, read an interesting paper on this subject and summarized his views in the following conclusions:—

1. It is proved that the causes of short-sightedness are habitually a prolonged application of sight during childhood combined with insufficient light.

2. In our climate illumination by diffused light never attains, even in the open air, to an injurious intensity.

3. The belief that bilateral light is injurious to the preservation of sight does not rest on any theoretical basis.

4. According to most recent statistics there are schools in which the light being bilateral, myopia is comparatively rare, and there exist others in which unilateral light is had under most favourable conditions, nevertheless myopia is as frequent as in the worst arranged schools. Experience is certainly not in favour of unilateral light.

5. Sufficient light by means of windows arranged on one side can only be obtained if the width of the room does not exceed the height of the lintels of the windows above the floor.

6. Light from behind, if it comes from above, may be usefully combined with lateral light; the light from a glazed roof is excellent.

7. Bilateral light should be preferred on all accounts. In this system, the width of the schoolroom being for the same height of windows twice as great as in the case of unilateral light, the intensity of the light in the middle of the room, which is the least benefited portion, is double that obtained by the same distance from windows where unilateral light is used. However, the width of the schoolroom must never exceed double the height of the windows.

8. Great importance must be attached to placing the school towards the east, and the axis should be directed from north-northeast, to south-southwest; a deviation of more than 40 degrees from the direction north-south should never be allowed except in exceptional climatic conditions.

9. The master should face the south.

10. Finally it is absolutely indispensable to reserve on every side of the schoolroom a strip of inalienable ground, of which the width should be double the height of the loftiest buildings that could be erected; allowing for the progress of civilization which has multiplied high storied buildings to an extent hitherto unknown in the country. *This last condition is the most important of all.*

MEDICAL NEWS.

RETROSPECTIVE AND PROSPECTIVE.

THIRTY-SEVEN years ago the "MEDICAL NEWS AND LIBRARY" was originated for the purpose of conveying to the readers of the "AMERICAN JOURNAL OF THE MEDICAL SCIENCES" a class of information for which the development of medicine seemed to call, but which did not come within the plan of the Quarterly. As the amount of this material was not as yet large, one-half of the "NEWS" was termed the "Library Department," and was devoted to the publication of books so arranged that the sheets could be detached and bound separately by the subscriber. It is a satisfaction in looking back over this long period to reflect that through all public vicissitudes of peace and war, of prosperity and adversity, the "NEWS" never once failed to make promptly its monthly visit, and that we have reason to believe it has been as unfailingly welcomed by its readers.

What seemed in 1843 an ample provision for the wants of the news-gatherer and news-consumer, finally, however, in the unparalleled development of medical science, proved inadequate, and in 1867 an effort was made to supply the deficiency by the republication of Ranking's "Half-Yearly Abstract" in conjunction with the "Journal" and "News." This was highly successful until the discontinuance of "Ranking" in England, in January, 1874, when its place was taken by a monthly "Supplement" to the "News," which in January, 1875, became the "Monthly Abstract."

The increasing activity of later years has rendered the slow process of supplying books at the rate of sixteen pages per month less satisfactory than of old, while it has heightened the difficulty of selecting works of interest and value to subscribers. Moreover, the ever extending attention paid to Clinical Medicine, which led, two years ago, to the introduction of a series of original American Clinical Lectures in the "NEWS," seems to call for an enlargement in the Clinical Department of the periodical. It has, therefore, been determined to merge together the "NEWS" and "ABSTRACT," abandoning the Library Department, paying more attention to clinics, maintaining the Monthly Abstract as an epitome of the progress of medicine thoroughly up to the wants of the time, while giving in the News Department such items of intelligence, domestic and foreign, as shall keep the reader amply informed as to all the medical movements of the day. To render this more attractive, correspondence is invited from all quarters.

The "JOURNAL" and the "NEWS AND ABSTRACT," by supplementing each other, will, as a whole, form a complete record of the advance of medical knowledge in all parts of the world, and it will be seen by reference to the publisher's prospectus how easily they are within the reach of the practitioner. That they shall be indispensable to every member of the profession will be the ambition of all concerned, and with such a record to look back upon in the more than half-century of the "JOURNAL" and the thirty-seven years of the "NEWS," it is felt that no promises for the future are necessary, except to say that the traditions of the past will be maintained and adapted to meet the ever-growing demands of scientific and professional progress.

In our next number we shall have the pleasure of laying before our readers a valuable and suggestive Clinical Lecture by Dr. S. Weir Mitchell on Hysterical Paralysis and its Treatment.

Treatment of Infected Localities at the end of the Yellow Fever Epidemic.

The *National Board of Health Bulletin* (Nov. 1, 1879) publishes the following memorandum on this subject, prepared by Drs. S. M. BEMISS and R. W. MITCHELL, of the National Board:—

1. A fall of temperature to the freezing point renders it safe for persons to visit places which have been dangerously infected with yellow fever; but it is to be remembered that cold cannot disinfect places or things in any way protected from its action.

2. Therefore, persons who have been absent from places infected with yellow fever during the past summer should be warned of the danger of occupying houses before they have been thoroughly cleansed, ventilated, fumigated, and chilled. The doors and windows should be opened, and all parts of the house exposed when the thermometer indicates the lowest degree of temperature; in other words, between sundown and sunrise. Fires should only be lighted a few hours before occupancy.

3. The measures of cleansing, disinfection, exposure to cold and air should include, as far as possible, closets, presses, cellars, shut places of every description, and boxes or trunks.

4. Privies, dry-wells, and cisterns should be emptied and cleansed.

5. All bedding, clothing, textile fabrics of all descriptions, or other material capable of shielding the infection from cold or from the air, should be disinfected by heat, either moist or dry, or by exposure to the atmosphere at low temperature.

6. These measures should be begun as long as possible before the return of absentees or visits by unprotected persons.

7. Persons returning to places which have been dangerously infected should exercise care in purchasing bedding or ready-made clothing without being assured that it has been properly disinfected.

Philadelphia Academy of Surgery.

On the 21st of April last a number of the prominent surgeons of this city met at the house of Prof. S. D. Gross to consider the propriety of founding a surgical society. The meeting was organized by the appointment of Dr. A. Hewson as chairman, and Dr. J. Ewing Mears as secretary. At a subsequent meeting it was determined to name the society the Philadelphia Academy of Surgery, and a constitution and by-laws were adopted. The first annual election of officers will be held in January, until which time the temporary organization was continued.

By the constitution the resident fellowship is limited to thirty; the honorary American to fifteen, and honorary foreign to ten. The meetings of the Academy will be held on the first Monday of every month. The first stated meeting was held in October, and valuable papers were read by Drs. S. D. Gross, S. W. Gross, and T. G. Morton, which elicited interesting discussions.

Prize Essay of the New York County Medical Society.

The Committee on Prize Essays, consisting of Drs. Fordyce Barker, Ellsworth Eliot, and Austin Flint, recommended at a recent meeting of the New York County Medical Society that the prize be awarded to the essay "On Affections of the Ear arising from Diseases of the Teeth," which upon opening the accompanying sealed envelope was found to have been written by Dr. Samuel Sexton. The Committee reported that "This essay seems worthy of this award, from its careful study and appreciation of the physiological relations of the organs discussed, its original suggestions, its important clinical facts, which seem to have been intelligently observed, and honestly reported, its simplicity, lucidity, and correctness in style, and its value as a contribution to practical medicine in an important class of affections, which, as bearing any relations as cause and effect, has hitherto received but slight attention from medical writers.

"If, now that the attention of the profession has been called to the association and supposed causal relations of the affections discussed in the essay, the conclusions of the author should be confirmed by the clinical studies of subsequent observers, the Society may well be congratulated on being the medium which has brought out such good work."

We are happy to state that this essay will be found in full in the January number of the *American Journal of the Medical Sciences.*

Pseudo-hypertrophic Paralysis.

A case of this rare disease was exhibited by M. DALLY at the Paris Therapeutical Society on the 8th inst. The symptoms, which coincide closely with the description given by Duchenne, were: muscular weakness beginning in the inferior extremities and the lumbo-spinal muscles, extending progressively, and finally affecting the upper extremities also; progressive increase in volume of most of the paretic muscles; hyperplasia of the interstitial connective tissue of the affected muscles, and the abundant production either of fibrous or of adipose tissue as the malady increased. According to M. Dally, only thirteen observations of this nature are on record.—*The Lancet*, Oct. 25, 1879.

The Physical Cause of Intermittent Fever.

The July number of the *Zeitschrift*, edited by Professor Klebs, contains some particulars of an investigation into the physical cause or poison to which marsh or intermittent fever is due. The inquiry was conducted by Professor Klebs of Prague, in conjunction with Signor Tommasi, Professor of Pathological Anatomy at Rome. The two investigators spent several weeks during the spring season in the Agro Romano, which is notorious for the prevalence of this particular kind of fever. They examined minutely the lower strata of the atmosphere of the district in question, as well as its soil and stagnant waters, and in the two former they discovered a microscopic fungus, consisting of numerous movable shining spores of a longish oval shape. This fungus was found to be artificially generated in various kinds of soil. The fluid matter obtained was filtrated and repeatedly washed, and the residuum left after filtration was introduced under the skin of healthy dogs. The animals experimented on all had the fever with the regular typical course. After explaining minutely the results of their various investigations and experiments, these gentlemen are of opinion that they have discovered the real cause of the disease in question. As the fungus grows into the shape of small rods, Tommasi and Klebs have given it the name of *Bacillus malariæ.*—*Med. Times and Gazette,* Oct. 18, 1879.

Spontaneous Gangrene in a New-born Infant.

Dr. BIDDER related at the St. Petersburg Medical Society (*St. Petersb. Med. Woch.*, Aug. 30) a remarkable case, in which the left foot of the fœtus presented for twelve hours, owing to the weakness of the pains, in a birth otherwise quite normal. As soon as they became stronger, delivery was easily accomplished. The foot and leg were, however, observed to be blue and œdematous, and in a few days complete gangrene was developed, with an incomplete line of demarcation above the malleoli. Superficial gangrene also affected the ends of some of the toes of the other foot. Amputation of the leg was performed on the fourteenth day. Primary union followed, and the child recovered. The cause of the gangrene was quite obscure, for no pressure of an injurious extent had been exerted by the uterus on the limb. Neither Dr. Mayerhofer, who had had under his notice 100,000 births at Vienna, nor Dr. Rauch, who perhaps has seen as many cases, ever met with a similar occurrence.—*Med. Times and Gazette*, Oct. 25, 1879.

Fatal Asphyxia occurring at Remote Periods after Anæsthesia.

In the *Gazette des Hopitaux*, Nos. 80 and 103, an account is given of a case which occurred in Prof. Richet's practice, of a patient, who, having inhaled chloroform during amputation of the breast without any immediate ill effects, was seized on the second day after the operation with bronchitis, with suffocating breathing, which proved fatal. Four similar cases occurred in M. Richet's practice which pursued the same course, one of the features in common being their occurrence in obese persons.—*Med. Times and Gazette*, Oct. 25, 1879.

Operations of the National Board of Health.

The principal steps taken by this Board, since its organization, to promote knowledge of sanitary matters are as follows, viz.:—

a. The appointment of a commission to study yellow fever in the island of Cuba, consisting of Drs. S. E. Chaillé and Col. T. S. Hardee, C. E., of New Orleans, Dr. John Guiterás, of Phila., and Surgeon G. M. Sternberg, U. S. A.

b. The collecting and collating the sanitary laws of the several States. This work has been going on under the direction of a standing committee of the Board, of which Dr. Henry I. Bowditch is chairman.

c. An investigation as to the best method of determining the amount and character of organic matter in the air, by Prof. Ira Remsen, of the Johns Hopkins University of Baltimore.

d. An investigation as to the effects of disinfectants—and more especially of those which may be used in disinfecting an inclosed space, such as a ship or house—upon the causes of the infective diseases. At the request of the Board this has been undertaken under the general direction of the Secretary of the Massachusetts Board of Health, Dr. C. F. Folsom, by Dr. W. S. Bigelow, of Boston, assisted by Dr. H. P. Bowditch, Professor of Physiology, and Dr. E. S. Wood, Professor of Chemistry, of Harvard University.

e. An investigation as to the composition and merits of the various patent disinfectants, which has been made at the request of the Board by Prof. C. F. Chandler, of Columbia College.

f. An investigation as to the prevalence of adulterations in food or drugs in the United States, under the charge of a standing committee, of which Dr. Hosmer A. Johnson, of Chicago, is chairman, and reports are being prepared by Dr. R. C. Kedzie, President State Board of Health of Michigan, and Professor Diehl, of Louisville, Ky.

g. A preliminary inquiry as to the diseases of food-producing animals in the

United States, under the charge of a standing committee, of which Dr. J. L. Cabell is chairman. A report is being prepared by Prof. James Law, of Cornell University, New York.

h. An investigation into the character of the water supply of a few of the smaller towns in the Southwest in which yellow fever prevailed last year, by Dr. Charles Smart, U. S. A.

i. An investigation as to the flow of sewers, in relation to their sizes and gradients, in some of our principal cities, under the direction of Col. George E. Waring, of Newport, R. I.

k. A sanitary survey of the eastern coast of New Jersey bordering on New York Harbor, under the direction of the State Board of Health of New Jersey.

l. The collection of the opinions of the principal sanitary organizations and sanitarians of the United States as to the proper form of a national public health organization, under the direction of the executive committee of the Board, and the results will be laid before the Committee of the National Academy of Science, which has been appointed to consult with the Board on these questions.

m. An investigation as to the hygiene of the mercantile marine, and an inquiry as to the legislation or other measures which may be desirable or expedient to promote the sanitary condition of our merchant marine, by Surgeon P. H. Bailhache, of the Marine Hospital Service.

All the above-mentioned investigations are in progress, and will, it is believed, yield valuable results.—*National Board of Health Bulletin*, Oct. 25, 1879.

State Medical Society Meetings.—The annual meeting of the Iowa State Medical Society will be held at Des Moines on Wednesday, January 28th, and of the New York State Medical Society at Albany on Tuesday, Feb. 3d, 1880.

German Railway Employés and Colour-blindness.—The result of the investigation of the German Railway Department into colour-blindness is that on the State lines one *employé* in 125 is affected by it, and on companies' lines one in 250, but these and local discrepancies in the return imply that the test applied was not uniform.—*Med. Times and Gazette*, Oct. 18, 1879.

Literary Notes.

The Messrs. Churchill have just published a treatise "On Glaucoma," by Mr. Priestley Smith, of Birmingham; to which the Jacksonian Prize for 1878 was awarded, in April, by the Council of the Royal College of Surgeons. It forms an octavo volume of 281 pages, and is beautifully illustrated by fourteen lithographic plates, eight of which are coloured, and are from original drawings. The same house has also issued Dr. Samuel Fenwick's "Outlines of Medical Treatment" (to be reprinted by Lindsay & Blakiston), and announces Nettleship's "Student's Guide to Diseases of the Eye" (to be republished by H. C. Lea), and "Clinical Lectures on Diseases of Women," by Matthews Duncan.

Smith, Elder & Co. have published a "Manual on Skin Diseases," by Malcolm Morris, Lecturer on Dermatology in the St. Mary's Medical School, London (reprinted by H. C. Lea), and a translation of Wecker's "Ocular Therapeutics."

H. K. Lewis has in press a monograph "On the Bile, Jaundice, and Bilious Diseases," with illustrations in chromo-lithography, by Dr. Wickham Legg, and has just published a translation of Prof. Virchow's brochure on "Infection-Diseases in the Army, chiefly Wound, Fever, Typhoid, Dysentery, and Diphtheria."

A translation from the third edition of Dr. Paul Guttman's "Handbook of Physical Diagnosis," comprising the throat, thorax, and abdomen, completes the New Sydenham Society's list for 1879, and will be reproduced in this country by Messrs. Wm. Wood & Co.

Dr. J. L. W. Thudichum, who is favourably known by his treatise on the "Pathology of the Urine," has just issued through the Longmans, the first volume of "Annals of Chemical Medicine," which embraces the application of chemistry to physiology, pathology, therapeutics, pharmacy, toxicology, and hygiene.

Messrs. Urban and Schwarzenberg, of Vienna, have issued the first fasciculus of "Real-Encyclopädie der Gesammten Heilkunde," under the editorship of Dr. Albert Eulenberg, assisted by upwards of ninety contributors, most of whom are well known by their work on this side of the Atlantic. This medico-chirurgical encyclopædia is to be completed in about ten volumes, each consisting of ten parts. The first fasciculus contains 80 pages, and extends from Aa to Ac; 32 of its pages are occupied by an excellent article, with illustrations, on typhoid fever, by W. Zuelzer, of Berlin.

Messrs. Adam and Charles Black have in press "Contributions to Obstetrics and Gynæcology," by Prof. Alex. R. Simpson of the University of Edinburgh.

Mr. H. C. Lea has just published a fourth edition of Bumstead's classical work on "Venereal Diseases." The author, with the assistance of Dr. R. W. Taylor, of New York, has revised and in great part rewritten the book, so that it may be fairly regarded as a new work rather than a new edition. It is estimated to contain one-half more reading matter than its predecessor. The same house have also issued the first volume of Reynolds's "System of Medicine," with notes and additions by Dr. Henry Hartshorne, and the remaining two volumes are promised in rapid succession. A third edition of Playfair's Midwifery, revised by the author especially for this country, and a new edition of Bowman's Medical Chemistry, which has long been out of print, remodelled and rewritten by Dr. Greene, Demonstrator of Chemistry in the University of Pennsylvania, are promised shortly. The long-expected and elaborate system of Anatomy, by Prof. Harrison Allen, of the University of Pennsylvania, we learn is now so far advanced that its appearance may be soon expected.

D. Appleton & Co. have recently published Dr. B. W. Richardson's "Ministry of Health," and have in press a "Practice of Medicine," by Dr. Roberts Bartholow, and a new and enlarged edition of Dr. Van Buren's monograph on "Diseases of the Rectum."

G. P. Putnam's Sons announce "The Essentials of Anatomy," by Drs. William Darling and A. L. Ranney.

The editorial staff of the *American Journal of Otology* will be increased by the addition of Prof. A. Graham Bell, the distinguished inventor of the Bell telephone.

J. P. Morton & Co., of Louisville, have published in handsome form Prof. Gross's eloquent Memorial Oration at the Dedication of the McDowell Monument, last May. It forms an octavo volume of 77 pages, and has for its frontispiece a steel engraving of the "Father of Ovariotomy."

—

OBITUARY RECORD.—At Paris, in the latter part of October, M. ALPHONSE DEVERGIE, aged 81 years.

M. Devergie was born in 1798, received his diploma in 1823, and became an Agrégé in 1825. In a few years he was appointed to the St. Louis Hospital, where he acquired his great reputation as a dermatologist. In 1874 he was elected President of the Academy of Medicine. For many years he enjoyed a great reputation as a medical expert, in which capacity he was a brilliant rival of Orfila and Tardieu. His best known works are his "Traité de Médecine Légale," which has passed through three editions, and his "Traité des Maladies de la Peau," which was originally published in 1854.

HENRY C. LEA'S

MEDICAL AND SURGICAL PUBLICATIONS.

INCREASED INDUCEMENT FOR SUBSCRIBERS TO

THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES.

TWO MEDICAL JOURNALS, containing nearly 2000 LARGE PAGES,

Free of Postage, for FIVE DOLLARS Per Annum.

TERMS FOR 1880:

THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES, published quarterly (1150 pages per annum), with The MEDICAL NEWS AND ABSTRACT monthly (768 pp. per annum), } Five Dollars per annum, in advance.

SEPARATE SUBSCRIPTIONS TO

THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES, when not paid for in advance, Five Dollars.

THE MEDICAL NEWS AND ABSTRACT, free of postage, in advance, Two Dollars and a Half.

⁂ Advance paying subscribers can obtain at the close of the year cloth covers, gilt-lettered, for each volume of the Journal (two annually), and of the News and Abstract (one annually), free by mail, by remitting ten cents for each cover.

It will thus be seen that for the moderate sum of FIVE DOLLARS in advance, the subscriber will receive, free of postage, the equivalent of three or four large octavo volumes, stored with the choicest matter, original and selected, that can be furnished by the medical literature of both hemispheres. Thus taken together, the "JOURNAL," and the "NEWS AND ABSTRACT" combine the advantages of the elaborate preparation that can be devoted to the Quarterly with the prompt conveyance of intelligence by the Monthly; while, the whole being under a single editorial supervision, the subscriber is secured against the duplication of matter inevitable when periodicals from different sources are taken together.

The periodicals thus offered at this unprecedented rate are universally known for their high professional standing.

I.

THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES,

EDITED BY I. MINIS HAYES, M.D.,

for more than half a century has maintained its position in the front rank of the medical literature of the world. Cordially supported by the profession of America, it circulates wherever the language is read, and is universally regarded as a national exponent of American medicine—a position to which it is entitled by the distinguished names from every section of the Union which are to be found among its collaborators. It is issued quarterly, in January, April, July, and October, each number containing about three hundred octavo pages, appropriately illustrated wherever necessary. A large portion of this space is devoted to Original Communications, embracing papers from the most eminent members of the profession throughout the country.

Following this is the REVIEW DEPARTMENT, containing extended reviews by competent writers of prominent new works and topics of the day, together with numerous elaborate Analytical and Bibliographical Notices, giving a fairly complete survey of medical literature.

Then follows the QUARTERLY SUMMARY OF IMPROVEMENTS AND DISCOVERIES IN THE MEDICAL SCIENCES, classified and arranged under different heads, and furnishing a digest of medical progress, abroad and at home.

Thus during the year 1879 the "JOURNAL" contained 75 Original Communications, mostly elaborate in character, 144 Reviews and Bibliographical Notices, and 207 articles in the Quarterly Summaries, illustrated with 72 maps and wood engravings.

That the efforts thus made to maintain the high reputation of the "JOURNAL" are successful, is shown by the position accorded to it both in America and Europe as a leading organ of medical progress :—

This is universally acknowledged as the leading American Journal, and has been conducted by Dr. Hays alone until 1869, when his son was associated with him. We quite agree with the critic, that this journal is second to none in the language, and cheerfully accord to it the first place, for nowhere shall we find more able and more impartial criticism, and nowhere such a repertory of able original articles. Indeed, now that the British and Foreign Medico-Chirurgical Review has terminated its career, the American Journal stands without a rival.—*Lond. Med. Times and Gaz.*, Nov. 24, 1877.

The present number of the American Journal is an exceedingly good one, and gives every promise of maintaining the well earned reputation of the review. Our venerable contemporary has our best wishes, and we can only express the hope that it may continue its work with as much vigor and excellence for the next fifty years as it has exhibited in the past. —*London Lancet*, Nov. 24, 1877.

The best medical journal on the continent.—*B ton Med. and Surg. Journal*, April 17, 1879.

The Philadelphia Medical and Physical Jour issued its first number in 1820, and, after a brilli career, was succeeded in 1827 by the Ameri Journal of the Medical Sciences, a periodical world-wide reputation; the ablest and one of oldest periodicals in the world—a journal which an unsullied record.—*Gross's History of Amer. M Literature*, 1876.

This is the medical journal of our country to wh the American physician abroad will point with greatest satisfaction, as reflecting the state of medi culture in his country. For a great many year has been the medium through which our ablest w ters have made known their discoveries and obser tions.—*Address of L. P. Yandell, M D., before ternational Med. Congress*, Sept. 1876.

And that it was specifically included in the award of a medal of merit to the Publish in the Vienna Exhibition in 1873.

The subscription price of the "American Journal of the Medical Sciences" has nev been raised during its long career. It is still Five Dollars per annum; and when pa for in advance, the subscriber receives in addition the "Medical News and Abstrac making in all nearly 2000 large octavo pages per annum, free of postage.

II.

THE MEDICAL NEWS AND ABSTRACT.

Thirty-seven years ago the "Medical News" was commenced as a monthly to conv to the subscribers of the "American Journal," the clinical instruction and current i formation which could not be accommodated in the Quarterly. It consisted of sixte pages of such matter, together with sixteen more known as the Library Departme and devoted to the publishing of books. With the increased progress of science, ho ever, this was found insufficient, and some years since another periodical, known as t "Monthly Abstract," was started, and was furnished at a moderate price to subscrib to the "American Journal." These two monthlies will hereafter be consolidated, und the title of "The Medical News and Abstract," and will be furnished *free of charge* connection with the "American Journal."

The "News and Abstract" will consist of 64 pages monthly, in a neat cover. It w contain a Clinical Department in which will be continued the series of Original Am ican Clinical Lectures, by gentlemen of the highest reputation throughout the Unit States, together with a choice selection of foreign Lectures and Hospital Notes a Gleanings. Then will follow the Monthly Abstract, systematically arranged and cl sified, and presenting five or six hundred articles yearly; and each number will conclu with a News Department, giving current professional intelligence, domestic and forei the whole fully indexed at the close of each volume, rendering it of permanent val for reference.

As stated above, the subscription price to the "News and Abstract" will be T Dollars and a Half per annum, invariably in advance, at which rate it will rank as o of the cheapest medical periodicals in the country. But it will also be furnished, fr of all charge, in commutation with the "American Journal of the Medical Sciences" all who remit Five Dollars in advance, thus giving to the subscriber, for that modera sum, a complete record of medical progress throughout the world, in the compass about two thousand large octavo pages.

In this effort to furnish so large an amount of practical information at a price so u precedentedly low, and thus place it within the reach of every member of the professio the publisher confidently anticipates the friendly aid of all who feel an interest in the di semination of sound medical literature. He trusts, especially, that the subscribers to t "American Medical Journal" will call the attention of their acquaintances to the adva tages thus offered, and that he will be sustained in the endeavor to permanently establi medical periodical literature on a footing of cheapness never heretofore attempted.

PREMIUM FOR OBTAINING NEW SUBSCRIBERS TO THE "JOURNAL"

Any gentlemen who will remit the amount for two subscriptions for 1880, one of whi at least must be for a *new subscriber*, will receive as a premium, free by mail, a copy either of the works enumerated on the next page.

⁂ Gentlemen desiring to avail themselves of the advantages thus offered will do w to forward their subscriptions at an early day, in order to insure the receipt of comple sets for the year 1880.

☞ The safest mode of remittance is by bank check or postal money order, dra to the order of the undersigned. Where these are not accessible, remittances for t "Journal" may be made at the risk of the publisher, by forwarding in registe letters. Address,

HENRY C. LEA, Nos. 706 and 708 Sansom St., Philadelphia, Pa.

PREMIUM FOR OBTAINING NEW SUBSCRIBERS TO THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES.

⁂ A copy of either of the works named below is offered, free of postage, as a premium to any subscriber to the "AMERICAN JOURNAL OF THE MEDICAL SCIENCES," who will procure a new subscriber, and remit the amount of both subscriptions—that is to say, TEN DOLLARS for two copies of the "JOURNAL" and "MEDICAL NEWS AND ABSTRACT." (See preceding page.)

BARNES' MIDWIFERY—Just Ready.

A MANUAL OF MIDWIFERY FOR MIDWIVES AND MEDICAL STUDENTS. By FANCOURT BARNES, M.D., M.R.C.P., Physician to the General Lying in Hospital, to the British Lying-in Hospital, etc. In one neat royal 12mo. volume of 200 pages, with 50 illustrations; cloth, $1 25. (See page 16.)

FOX ON DISEASES OF THE SKIN—New Edition—Just Ready.

EPITOME OF SKIN DISEASES, WITH FORMULÆ. For Students and Practitioners. By TILBURY FOX, M.D., F.R.C.P., Physician to Department of Skin Diseases, Univ. College Hospital, London; and T. C. FOX, B.A., M.R.C.S. Second Edition. Thoroughly Revised and greatly Enlarged. In one very handsome 12mo. volume of 216 pages; cloth, $1 38. (See page 16.)

HOLDEN'S LANDMARKS—Now Ready.

LANDMARKS, MEDICAL AND SURGICAL. By LUTHER HOLDEN, F.R.C.S., Surgeon to St. Bartholomew's and the Foundling Hospitals. Author of "Human Osteology," "A Manual of Dissections," etc. From the Second London edition. In one handsome royal 12mo. volume of 128 pages; cloth, 88 cents.

FOTHERGILL'S ANTAGONISM OF MEDICINES—Now Ready.

THE ANTAGONISM OF THERAPEUTIC AGENTS AND WHAT IT TEACHES. By J. MILNER FOTHERGILL, M D. Edin., M.R.C.P. Lond., Asst. Phys. to the West Lond. Hosp., Asst. Phys. to the City of Lond. Hosp, etc. 1 vol. royal 12mo.; cloth, $1.

BROWNE ON THE OPHTHALMOSCOPE—Just Issued.

HOW TO USE THE OPHTHALMOSCOPE. Being Elementary Instructions in Ophthalmoscopy, Arranged for the Use of Students. By EDGAR A. BROWNE, Surgeon to the Liverpool Eye and Ear Infirmary, and to the Dispensary for Skin Diseases. With 35 Illustrations. In one small royal 12mo. volume of 120 pages; cloth, $1.

FLINT'S MEDICAL ESSAYS—Just Issued.

ESSAYS ON CONSERVATIVE MEDICINE AND KINDRED TOPICS. By AUSTIN FLINT, M D., Professor of the Principles and Practice of Medicine in Bellevue Med. College, N. Y. In one very handsome volume, royal 12mo.; cloth, $1 38.

STURGES'S CLINICAL MEDICINE—Lately Issued.

AN INTRODUCTION TO THE STUDY OF CLINICAL MEDICINE; Being a Guide to the Investigation of Disease. For the use of Students. By OCTAVIUS STURGES, M.D., Assistant Surgeon to Westminster Hospital, &c. In one neat volume, royal 12mo.; cloth, $1 25.

SWAYNE'S OBSTETRIC APHORISMS—Lately Issued.

OBSTETRIC APHORISMS, FOR THE USE OF STUDENTS COMMENCING MIDWIFERY PRACTICE. By JOSEPH GRIFFITHS SWAYNE, M.D., Physician Accoucheur to the British General Hospital. With Illustrations. Second American, from the fifth revised London edition. With additions, by E. R. HUTCHINS, M.D. In one neat volume, small 12mo.; cloth, $1 25.

WEST ON NERVOUS DISEASES.

ON SOME DISORDERS OF THE NERVOUS SYSTEM IN CHILDHOOD. Being the Lumleian Lectures delivered at the Royal College of Physicians of London, in March, 1871. By CHARLES WEST, M.D., Physician to the Hospital for Sick Children, &c. In one neat volume, small 12mo.; cloth, $1 00.

TANNER'S CLINICAL MANUAL—Enlarged Edition.

A MANUAL OF CLINICAL MEDICINE AND PHYSICAL DIAGNOSIS. By THOMAS HAWKES TANNER, M.D, F.L S.A. Third American, from the second English edition. Revised and enlarged by TILBURY FOX, M.D., Physician to the Skin Department in University College, London. In one handsome volume, small 12mo., of 366 pages; cloth, $1 50.

A NEW JOURNAL OF OBSTETRICS AND GYNÆCOLOGY.

REDUCTION OF THE SUBSCRIPTION PRICE.

THE OBSTETRICAL JOURNAL

OF

GREAT BRITAIN AND IRELAND.

INCLUDING MIDWIFERY AND THE DISEASES OF WOMEN AND CHILDREN.

EDITED BY A. L. GALABIN, M.A., M.D.,

Assistant Phys. to Guy's Hospital, London.

Published Monthly, each Number containing sixty-four octavo pages, very handsomely printed, and appropriately illustrated wherever necessary.

Subscription Price, Three Dollars per annum, in advance.
Single numbers, Twenty-five cents.

With the January Number will terminate Vol. VII. of the Obstetrical Journal. The first No. of Vol. VIII. will be issued about Feb. 1st; the "AMERICAN SUPPLEMENT" of 16 pages per No. will be discontinued, and the periodical will thenceforth consist of 64 pages per number, at the exceedingly low price of THREE DOLLARS per annum, free of postage. For this trifling sum the subscriber will thus obtain more than 750 pages per annum, containing an extent and variety of information which may be estimated from the fact that Vol. VI. of the "OBSTETRICAL JOURNAL" contained in

and that it numbers among its contributors the distinguished names of LOMBE ATTHILL, J. H. AVELING, ROBERT BARNES, J. HENRY BENNET, NATHAN BOZEMAN, THOMAS CHAMBERS, FLEETWOOD CHURCHILL, CHARLES CLAY, JOHN CLAY, J. MATTHEWS DUNCAN, ARTHUR FARRE, ROBERT GREENHALGH, W. M. GRAILY HEWITT, J. BRAXTON HICKS, WILLIAM LEISHMAN, ANGUS MACDONALD, ALFRED MEADOWS, ALEX. SIMPSON, J. G. SWAYNE, LAWSON TAIT, EDWARD J. TILT, E. H. TRENHOLME, T. SPENCER WELLS, ARTHUR WIGGLESWORTH, and many other distinguished practitioners. Under such auspices it has amply fulfilled its object of presenting to the physician all that is new and interesting in the rapid development of obstetrical and gynæcological science.

As a very large increase in the subscription list is anticipated under this reduction in price, gentlemen who propose to subscribe, and subscribers intending to renew their subscriptions are recommended to lose no time in making their remittances, as the limited number printed may at any time be exhausted.

⁂ Specimen numbers forwarded to any post-office in the U. S., free of postage, on the receipt of 25 cents.

This is certainly a very excellent journal. It gives us the best obstetrical literature from across the water. —*Indiana Journ. of Med.*, Nov. 1874.

We cannot withhold the expression of the admiration this elegant journal excites.—*Western Lancet*, March, 1875.

Remittances of subscriptions can be made at the risk of the undersigned by Bank Draft or P. O. Money Order, or, where these are not procurable, by registered letter. Address

HENRY C. LEA,
Nos. 706 and 708 Sansom St., Philadelphia.

CONDENSED LIST
OF
HENRY C. LEA'S
MEDICAL AND SURGICAL PUBLICATIONS.

At the printed prices these books can generally be furnished by booksellers in all parts of the United States. They will be sent by mail, prepaid, to any post-office in the States, or the Dominion, on receipt of the amount; but no risks are assumed, either on the money or on the books. Gentlemen will, therefore, in most cases, find it more convenient to deal with the nearest bookseller.

Detailed Catalogues furnished on application. Illustrated Catalogues sent by mail on receipt of ten cents in postage stamps.

PHILADELPHIA, December, 1879.

Winckel on Diseases of Childbed. With illus. 1 vol. 8vo. Cloth	4 00

DUNGLISON'S MEDICAL DICTIONARY—Lately Issued.

MEDICAL LEXICON; A DICTIONARY OF MEDICAL SCIENCE; containing a concise explanation of the various subjects and terms of Anatomy, Physiology, Pathology, Hygiene, Therapeutics, Pharmacology, Pharmacy, Surgery, Medical Chemistry, Obstetrics, Medical Jurisprudence, and Dentistry; notices of Climate and of Mineral Waters; Formulæ for Officinal, Empirical, and Dietetic Preparations; with the Accentuation and Etymology of the Terms, and the French and other Synonyms. By ROBLEY DUNGLISON, M.D., Late Professor of the Institutes of Medicine, etc., in Jefferson Medical College, Philadelphia. A new edition, enlarged and thoroughly revised, by RICHARD J. DUNGLISON, M D. In one very large and handsome royal octavo volume of about 1150 pages; cloth, $6 50; leather, with raised bands, $7 50.

The distinguished author was occupied in this work up to the time of his death. Since then, it has been taken up and ably completed by Richard J. Dunglison, M.D., who has carried out as far as possible his father's plans and wishes. The dictionary, in its present form, is a medical library in itself, and one of which every physician should be possessed.—*N. Y. Med. Journal*, Feb. 1874.

As a standard book of reference, as one of the best, if not the very best, medical dictionary in the English language, Dunglison's work has been well known for about forty years, and needs no words of praise on our part to recommend it to the members of the medical, and, likewise, of the pharmaceutical profession. The latter especially are in need of such a work, which gives ready and reliable information on thousands of subjects and terms which they are liable to encounter in pursuing their daily avocations, but with which they cannot be expected to be familiar. The work before us fully supplies this want.—*Am. Journ. of Pharm.*, Feb. 1874.

A valuable dictionary of the terms employed in medicine and the allied sciences, and of the relations of the subjects treated under each head. It reflects great credit on its able American author, and well deserves the authority and popularity it has obtained.—*British Med. Journ.*, Oct. 31, 1874.

Few works of this class exhibit a grander monument of patient research and of scientific lore. The extent of the sale of this lexicon is sufficient to testify to its usefulness, and to the great service conferred by Dr. Robley Dunglison on the profession, and indeed on others, by its issue.—*Lond. Lancet*, May 13, 1875.

TO BE SOLD BY SUBSCRIPTION ONLY.

REYNOLDS'S SYSTEM OF MEDICINE.

A SYSTEM OF MEDICINE.

EDITED BY J. RUSSELL REYNOLDS, M.D.,
Professor of the Principles and Practice of Medicine in University College, London.

WITH NOTES AND ADDITIONS BY

HENRY HARTSHORNE, M.D.,
Late Professor of Hygiene in the University of Pennsylvania.

To be completed in three large and handsome royal octavo volumes, containing in all abo THREE THOUSAND clearly printed double-columned pages, with numerous illustrations.

Subscription price in cloth binding, $15 00; *in leather, raised bands*, $18.00.
Price per volume, in cloth, $5.00; *in leather*, $6.00.

VOLUME I. (*now ready*) contains GENERAL DISEASES and DISEASES OF THE NERVO SYSTEM.

VOLUME II. (*nearly ready*) will contain DISEASES OF THE RESPIRATORY and CIRCULATO SYSTEMS.

VOLUME III. (*shortly*) will contain DISEASES OF THE DIGESTIVE and BLOOD GLANDUL SYSTEMS, OF THE URINARY ORGANS, OF THE FEMALE REPRODUCTIVE SYSTEM, and o THE CUTANEOUS SYSTEM.

Reynolds's SYSTEM OF MEDICINE, recently completed, has acquired, since the first appearan of the first volume, the well-deserved reputation of being the work in which modern Briti medicine is presented in its fullest and most practical form. This could scarce be otherwise i view of the fact that the object kept in view throughout has been the treatment and cure disease, and that the whole is the result of the collaboration of the leading minds of the pr fession, each subject being treated by some gentleman who is regarded as its highest authorit Thus we have Diseases of the Bladder by Sir HENRY THOMPSON, Malpositions of the Uterus GRAILY HEWITT, Insanity by HENRY MAUDSLEY, Consumption by J. HUGHES BENNET, Diseas of the Spine by CHARLES BLAND RADCLIFFE, the Heart by FRANCIS SIBSON, Alcoholism FRANCIS E. ANSTIE, Renal Affections by WILLIAM ROBERTS, Asthma by HYDE SALTER, Cer bral Affections by H. CHARLTON BASTIAN, Gout and Rheumatism by ALFRED BARING GARRO Constitutional Syphilis by JONATHAN HUTCHINSON, Diseases of the Stomach by WILSON FO Diseases of the Skin by BALMANNO SQUIRE, Affections of the Larynx by MORELL MACKENZI Diseases of the Rectum by BLIZARD CURLING, Diabetes by LAUDER BRUNTON, Intestinal Diseas by JOHN SYER BRISTOWE, Catalepsy and Somnambulism by THOMAS KING CHAMBERS, Apople by J. HUGHLINGS JACKSON, Angina Pectoris by Professor GAIRDNER, Emphysema of the Lun by Sir WILLIAM JENNER, etc. etc. All the leading schools in Great Britain have thus contri uted their best men in generous rivalry, to build up this monument of medical science—S Bartholomew's, Guy's, St. Thomas's, University College, Westminster College, St. Mary's London, while the Edinburgh, Glasgow, and Manchester schools are well represented, the Arm Medical School at Netley, the military and naval services, and the public health boards. Th a work conceived in such a spirit, and carried out under such auspices should prove an indi pensable treasury of facts and experience, suited to the daily wants of the practitioner, w inevitable, and the success which it has enjoyed in England, and the reputation which it h acquired on this side of the Atlantic have sealed it with the approbation of the two pre-em nently practical nations.

Its large size and high price having kept it beyond the reach of many practitioners in t country who desire to possess it, a demand has arisen for an edition at a price which shall rend it accessible to all. To meet this demand the present edition has been undertaken. The f volumes and five thousand pages of the original will, by the use of a small, but very clear, ty and double columns, be compressed into three volumes of about three thousand pages, clea and handsomely printed, and offered at a price which renders it one of the cheapest works e presented to the American profession.

But not only will the American edition thus be more convenient and lower priced than t English; it will also be better and more complete. Some years having elapsed since the appe ance of a portion of the work, additions will be required to bring up the subjects to the existi condition of science. Some diseases, also, which are comparatively unimportant in Englan require more elaborate treatment to adapt the articles devoted to them to the wants of t American physician; and there are points on which the received practice in this country diff from that adopted abroad. The supplying of these deficiencies has been undertaken by HEN HARTSHORNE, M.D, late Professor of Hygiene in the University of Pennsylvania, who w endeavor to render the work fully up to the day, and as useful to the American physician as has proved to be to his English brethren. The number of illustrations will also be large increased, and no effort will be spared to render the typographical execution unexceptionab in every respect.

The first volume, containing 1185 pages, is now ready. Volume II. is far advanced, and t completion of the whole may be expected early in March, 1880.

REYNOLDS'S SYSTEM OF MEDICINE.

The thoroughness with which the plan of the work has been carried out, and the eminent fitness of the gentlemen to whom the execution of its details has been allotted, will be recognized in the following

LIST OF AUTHORS AND SUBJECTS.

William Aitken, M.D., Prof. of Pathology in the Army Med. School, Netley.
Dengue, or Dandy Fever.
Rickets.

Francis Edmund Anstie, M.D.. Lect. on Med in Westminster Hosp. Med. School.
Hypochondriasis.
Alcoholism.
Neuralgia.
Hepatalgia.
Pleurodynia
Pleurisy.
Hydrothorax.
Pneumothorax.

William R. Basham, M.D., Lect. on Prin. and Pract. Med. in Westminster Hosp.
Nephralgia.
Calculous Disease of the Kidney.

Henry Charlton Bastian, M.D., Prof. of Path. Anat. in University College.
Congestion of the Brain.
Cerebritis.
Softening of the Brain.
Adventitious Products in the Brain.
Cirrhosis of the Lung.

Marcus Beck, M.B., Teacher of Surgery at University College.
Nephritis and Pyelitis consecutive to affections of the lower Urinary Tract.

J. Warburton Begbie. M.D., Physician to the Royal Infirmary of Edinburgh.
Relapsing Fever.
Neuritis and Neuroma.
Local Paralysis from Nerve Disease.
Local Spasms.
Local Anæsthesia.
Colic.
Colitis.
Dysentery.
Fatty Liver.
Cancer of the Liver.
Hydatid Disease of the Liver.
Waxy Disease of the Liver.
Pneumo Pericardium.
Hydro-Pericardium.

Hermann Beigel, M.D., Physician to the Metropolitan Free Hospital.
Roseola.
Cancer of the Lungs.
Exophthalmic Goitre.

J. Hughes Bennet, M.D., Prof. of the Institutes of Med. in the Univ. of Edin.
Phthisis Pulmonalis.

J. Syer Bristowe, M.D., Physician to St. Thomas's Hospital.
Pyæmia.
Obstruction of the Bowels.
Ulceration of the Bowels.
Cancerous and other Growths of Intestines.
Diseases of Cæcum and Append. Vermiform.
Tubercle of the Peritoneum.
Carcinoma of the Peritoneum.
Affections of Abdominal Lymph. Glands.
Ascites.
Diseases of Arteries.
Diseases of Veins.
Cardiac Concretions.
Thrombosis and Embolia.

Bernard E. Brodhurst, F.R.C.S., Lec. on Orthopædic Surgery at St. George's Hosp.
Gonorrhœal Rheumatism.

George Buchanan, M.D., Inspector of Public Health in H. M. Privy Council.
Typhus Fever.

Thomas Buzzard, M D., Phys. to Nat. Hosp. for the Paralyzed and Epileptic.
Scorbutus, or Scurvy.

T. Lauder Brunton, M.D., Lecturer on Mat. Med. and Therap. in St. Bar. Hospital.
Diabetes Mellitus.
Diabetes Insipidus.

Thomas King Chambers, M.D., Lecturer on Med. in St. Mary's Hospital.
Ecstasy.
Catalepsy.
Somnambulism and Allied States.

Thomas Blizard Curling, F.R.C.S., Consulting Surgeon to the London Hospital.
Diseases of the Rectum and Anus.

C. Hilton Fagge, M.D., Senior Assistant Physician to Guy's Hospital.
Diseases of the Valves of the Heart.

Tilbury Fox, M.D., Physician to Dept. of Skin Diseases in Univ. College Hosp.
Purpura.

Wilson Fox, M.D., Prof. Clinical Medicine in University College.
Diseases of the Stomach—
- Disorders of Function.
- Atonic Dyspepsia.
- Neuroses of the Stomach.
- Gastritis.
- Chronic Gastritis.
- Chron. Ulcer of Stomach and Duodenum.
- Cancer of the Stomach.
- Hemorrhage from the Stomach.
- Hypertrophy of Walls of Stomach.
- Stricture and Obstruction of Card. Orifice.
- Stricture and Obstruction of the Pylorus.
- Dilatation of the Stomach.
- Softening of the Stomach.
- Perforation of the Stomach.
- Rupture of the Stomach.
- Tubercle of the Stomach.

Pneumonia.
Syphilitic Affections of the Lung.
Brown Induration of the Lung.

William Tennent Gairdner, M.D., Prof. of Prac. of Physic in Glasgow University.
Angina Pectoris, and Allied States, including certain forms of Sudden Death.

Arthur Gamgee, M.D., late Resident Phys. to the Royal Infirmary, Edinburgh.

John Gamgee, M.D., Principal of the Albert Veterinary College.
Glanders—Equinia.
Hydrophobia.

Alfred Baring Garrod, M.D., Prof. of Mat. Med. and Therap. in King's College.
Gout.
Rheumatoid Arthritis.
Rheumatism.

REYNOLDS'S SYSTEM OF MEDICINE.

List of Authors and Subjects—*Continued.*

Samuel Jones Gee, M.D., Asst. Physician to St. Bartholomew's Hospital.
Scarlet Fever.
Varicella.
Tubercular Meningitis.

Sir William W. Gull, M.D., late Physician to Guy's Hospital.
Hypochondriasis.
Abscess of the Brain.

Edward Goodeve, M.B., Dep. Inspect.-Gen. of Hospitals, H. M. Bengal Army.
Diarrhœa.
Epidemic Cholera.
Jaundice.
Biliary Calculi.
Chronic Atrophy of the Liver—Cirrhosis.
Acute or Yellow Atrophy of the Liver.

William R. Gowers, M.D., Asst. Prof. of Clinical Medicine in Univ. College.
Carditis.
Atrophy of the Heart.
Hypertrophy of the Heart.
Dilatation of the Heart.
Fatty Diseases of the Heart.
Fibroid Disease of the Heart.
Splenic Leucocythæmia.
Hodgkin's Disease.

John Harley, M.D., Assist. Physician to the London Fever Hospital.
Enteric, or Typhoid Fever.

Henry Hartshorne, M.D., late Prof. of Hygiene in Univ. of Pennsylvania.
Chlorosis.
Scrofula.
Rötheln.
Cholera Infantum.
Pernicious Fever.
Typho-Malarial Fever.
and a large number of annotations throughout the work.

W. M. Graily Hewitt, M.D., Prof. of Midwifery in University College.
Apneumatosis.
Changes in Shape and Position of Uterus.
Disorders of Uterine Functions.

Thomas Hillier, M.D., late Phys. to Dept. for Skin Diseases, Univ. Coll. Hosp.
Purpura.

Jonathan Hutchinson, F.R.C.S., Surgeon to the London Hospital.
Constitutional Syphilis.

J. Hughlings Jackson, M.D., Phys. to the Nat. Hosp. for Paralysis.
Cerebral Hemorrhage and Apoplexy.

Sir William Jenner, M.D., Phys. to Univ. Coll. Hospital.
Emphysema of the Lungs.

John Denis Macdonald, F.R.S., Staff Surgeon to H. M. S. Victory.
Yellow Fever.

Morell Mackenzie, M.D., Physician to the Hosp. for Diseases of the Throat.
Diseases of the Larynx.
Acute Laryngitis.
Chronic Laryngitis.
Morbid Growths.
Neuroses.
Secondary Diseases in Acute affections.
Secondary Diseases in Chronic affect'ns.
Syphilis.
Secondary Œdema.

W. C. Maclean, M.D., Prof. of Clin. and Mil Med. in the Army Med. School, Netley.
Malarial Fevers.
Intermittent Fever.
Remittent Fever.
Dysentery.
Sunstroke.
Congestion of the Liver.
Suppurative Inflammation of the Liver.
Gangrenous Inflammation of the Liver.

James Furness Marson, F.R.C.S., Residen Surgeon to the Smallpox Hospital.
Smallpox.

Henry Maudsley, M.D., Prof. of Med. Juris prudence in University College.
Insanity.

Gavin Milroy, M.D., Sup. Med. Inspector t the General Board of Health.
The Plague.

William Murray, M.D., Consulting Phys. t Newcastle Hosp. for Sick Children.
Aneurism of the Abdominal Aorta.

Edmund A. Parkes, M.D., Prof. of Hygien in the Army Med. School, Netley.
Influenza.

T. Bevill Peacock, M.D., Phys. to St. Tho mas's Hospital.
Weight and Size of the Heart.
Lateral or Partial Aneurism of the Heart.
Adventitious Products in the Heart.

R. Douglas Powell, M.D., Physician to th Brompton Consumption Hospital.
Mediastinal Tumors.
Diseases of the Aorta.
Aneurism of the Thoracic Aorta.
Diseases of the Pulmonary Artery.
Diseases of the Coronary Arteries.

Wm. Overend Priestley, M.D.
Inflammation of the Uterus; Metritis
Pelvic Hæmatocele.
Pelvic Cellulitis; Pelvic Peritonitis.

Charles Bland Radcliffe, M.D., Physicia to the Westminster Hospital.
Chorea.
Diseases of the Spinal Cord.
Meningitis.
Myelitis.
Congestion.
Tetanus.
Locomotor Ataxy.
Spinal Irritation.
General Spinal Paralysis.
Hysterical Paraplegia.
Reflex Paraplegia.
Infantile Paralysis.
Spinal Hemorrhage.
Non-inflammatory Spinal Softening.
Induration of the Spinal Cord.
Atrophy and Hypertrop. of Spinal Cord
Tumor of the Spinal Cord.
Concussion of the Spine.
Compression of the Spinal Cord.
Caries of the Spinal Column.
Spina Bifida.

REYNOLDS'S SYSTEM OF MEDICINE.

LIST OF AUTHORS AND SUBJECTS—*Continued.*

JOHN NETTEN RADCLIFFE, M.D., Inspector of Public Health H M. Privy Council.
Epidemic Cerebro-Spinal Meningitis.

J. SPENCE RAMSKILL, M.D., Physician to the London Hospital.
Vertigo.
Simple Meningitis.
Chronic Hydrocephalus.
Meningeal Hemorrhage.

WM. HENRY RANSOM, M.D., Physician to the General Hospital, Nottingham.
Intestinal Worms.

J. RUSSELL REYNOLDS, M.D., Prof. of Medicine in University College.
Introduction—Natural History of Disease, Diagnosis, Prognosis, Pathology, Therapeutics, and Hygienics.
Erysipelas.
Hysteria.
Writer's Cramp.
Epilepsy.
Muscular Anæsthesia.
Congestion of the Brain.
Cerebritis.
Softening of the Brain.
Adventitious Products in the Brain.
Torticollis.
Inflammation of the Lymphatic Vessels.

SYDNEY RINGER, M.D., Prof. of Mat. Med. and Therap. in University College.
Measles.
Parotitis.
Sudamina and Miliaria.

FREDERICK T. ROBERTS, M.D., Asst. Physician to University College Hospital.
Bronchitis.
Diseases of the Renal Bloodvessels
Calculous Disease of the Kidney.
Hydronephrosis.
Renal Abscess.
Tumors and New Growths of the Kidney.
Diseases of the Ureter.

WILLIAM ROBERTS, M.D., Lecturer on Medicine in the Manchester Sch. of Med.
Wasting Palsy.
Hematuria.
Endemic Hæmaturia.
Hæmatinuria and Paroxys. Hæmatinuria.
Albuminuria.
Congestion of the Kidneys.
Bright's Disease.
Anomalies in the Position, Form, and Number of the Kidneys.

HYDE SALTER, M.D., Physician to the Charing Cross Hospital.
Asthma.

WM. RUTHERFORD SANDERS, M.D., Lecturer on the Institutes of Medicine, Edinb.
Paralysis Agitans.
Metallic Tremor

EDWARD CATOR SEATON, M.D., Med. Dept. of H. M. Privy Council.
Vaccination.

FRANCIS SIBSON, M.D., late Lecturer on Medicine in St. Mary's Hospital.
Position and Form of the Heart and Great Vessels.
Malpositions of the Heart.
Pericarditis.
Adherent Pericardium.
Endocarditis.

EDWARD SMITH, M.D., Asst. Physician to the Brompton Consumption Hospital.
Whooping-Cough.

CHARLES E. SQUAREY, M B., Asst. Phys. to the Hospital for Women.
Diseases of the Mouth.
Diseases of the Fauces, Pharynx, and Œsophagus.

WILLIAM SQUIRE, M.D., late Senior Surgeon to the St. Marylebone Infirmary.
Croup.
Diphtheria.

A. J. BALMANNO SQUIRE, M.B., Surgeon to the British Hosp. for D's. of the Skin.
Diseases of the Cutaneous System—
Exanthemata.
Squamæ.
Papulæ.
Vesiculæ.
Pustulæ.
Bullæ.
Tubercula.
Maculæ.
Syphilida.
Animal Parasitic Diseases.
Vegetable Parasitic Diseases.
Foreign Diseases.

HENRY G. SUTTON, M.D., Asst. Physician to the London Hospital.
Abscess of the Brain

SIR HENRY THOMPSON, M.B., Emeritus Prof. Clin. Surg. in Univ. College Hosp.
Affections of the Bladder.

J. RICHARD WARDELL, M D., Physician to the Tunbridge Wells Infirmary.
Enteralgia.
Peritonitis.
Diseases of the Pancreas.
Diseases of the Spleen.

SAMUEL WILKS, M.D., Physician to Guy's Hospital.
Addison's Disease.

JOHN WILLIAMS, M.D., Asst. Obstetric Phys. to University Coll. Hosp.
Growths in the Uterus.
Inflammation of the Ovary.
Ovarian Tumors.

BUMSTEAD ON VENEREAL DISEASES—New Edition—Just Ready.

THE

PATHOLOGY AND TREATMENT OF VENEREAL DISEASES

INCLUDING

THE RESULTS OF RECENT INVESTIGATIONS UPON THE SUBJECT.

BY FREEMAN J. BUMSTEAD, M.D., LL.D.,

Late Professor of Venereal Diseases at the Coll. of Phys. and Surg., New York, etc.

Fourth edition, revised and largely re-written with the co-operation of

R. W. TAYLOR, M.D.,

Of New York, Prof. of Dermatology in the Univ. of Vermont.

In one large and handsome 8vo. *volume of* 835 *pages, with* 138 *illustrations. Cloth,* **$4 75**; *leather,* **$5 75.**

This work, on its first appearance, immediately took the position of a standard authority o its subject wherever the language is spoken, and the success of an Italian translation show that it is regarded with equal favor on the Continent of Europe. In repeated editions the autho labored sedulously to render it more worthy of its reputation, and in the present revision n pains have been spared to perfect it as far as possible. Several years having elapsed since th publication of the third edition, much material has been accumulated during the interval b the industry of syphilologists, and new views have been enunciated. All this, so far as confirmed by observation and experience, has been incorporated, many portions of the volume hav been rewritten, the series of illustrations has been enlarged and improved, and the whole ma be regarded rather as a new work than as a new edition. It is confidently presented as fully o a level with the most advanced condition of syphilology, and as a work to which the practitioner may refer with the certainty of finding clearly and succinctly set forth whatever fall within the scope of such a treatise.

SMITH ON CHILDREN—New Edition—Just Ready.

A COMPLETE PRACTICAL TREATISE ON THE DISEASES OF CHILDREN

BY J. LEWIS SMITH, M.D.,

Clinical Professor of Diseases of Children in the Bellevue Hospital Medical College, New York.

Fourth edition, revised and enlarged.

In one handsome octavo volume of over 750 *pages, with illustrations; cloth,* **$4 50**; *leather,* **$5 50**

That this work has become standard is shown by the fact that a fourth edition has so soon been called for. It is a magnificent work, and essential to every true practitioner's library. It is not a book written by one whose object is simply to advance a theory of his own; but its every page shows rather the hand-writing of one who has studied his subject, consulted the best literature, made practical tests of the plans of diagnosis and treatment, and publishes what experience proves to be true. As there is no one book that we have ever seen in any language that equals it as a practitioner's guide or as a text book on diseases of children, we need not undertake an analytical examination; but we do most unreservedly commend this edition, as we did the former, to every practising physician. He will have an almost daily use for it.—*Va. Med. Monthly*, July, 1879.

In the period which has elapsed since the third edition of the work, so extensive have been the advances that whole chapters required to be re-written, and hardly a page could pass without some material correction or addition. This labor has occupied the writer closely, and he has performed it conscientiously, so that the book may be considered a faithful portraiture of an exceptionally wide clinical experience in infantile diseases, corrected by a careful study of the recent literature of the subject.—*Med. and Surg. Reporter*, April 5, 1879.

The perusal of Dr. Smith's work has afforded us much pleasure and still more instruction. Its place is amongst the first of American medical works There is no work on the subject we can more conscientiously recommend to our readers.—*Canada Med. and Surg. Journ.*, June, 1879.

The high appreciation in which this excellent work is held by the profession is best attested by the fact that on the completion of its first decade it has reached a fourth edition, and it only remains for us to add that the revision which it has jus undergone brings its teachings fully abreast th latest advances of medical knowledge.—*Am. Jour Med. Sci.*, July, 1879.

The author of this work has acquired an immens experience as physician to three of the large charities in New York in which children are treate These asylums afford unsurpassed opportunities fo observing the effects of different plans of treatmen and the results as embodied in this volume may b accepted with faith, and should be in the possessio of all practitioners.—*Nat. Med. Review*, April, 187

Nine-tenths of the profession in America alread draw their information upon diseases of childre from Dr. Smith's work. There is nothing to crit cize adversely in it; like good wine it needs n praise; it is too extended to permit of anything lik a recapitulation of its contents; and we feel that ou duty towards our readers is best fulfilled by limi ing our notice of the book to the simple mention tha a new edition has appeared, revised and enlarged i many points, and containing the newest truths an doctrines in etiology, pathology, and treatment.—*N. C. Med. Journal*, June, 1879.

Were the inquiry made of us, "What book sha I purchase on the diseases of children in preferen to any other?" we should answer without hesita tion, that which heads this notice.—*Pacific Medic and Surgical Journal*, May, 1879.

It has been for several years the standing work o the diseases of which it treats, and this new editio embodies all the improvements in pathology an therapeutics which have become established sin the publication of its predecessors. There is ver little in the book to which exception can be take while it must be regarded as the very best work o the diseases of children, either for the student o practitioner before the profession.—*Canadian Jou nal of Medical Science*, June, 1879.

LEISHMAN'S MIDWIFERY—New Edition—Just Ready.

A SYSTEM OF MIDWIFERY:

INCLUDING THE DISEASES OF PREGNANCY AND THE PUERPERAL STATE

By WILLIAM LEISHMAN, M.D.,
Regius Professor of Midwifery in the University of Glasgow, etc.

THIRD AMERICAN EDITION, REVISED BY THE AUTHOR,
WITH ADDITIONS BY JOHN S. PARRY, M.D.,
Obstetrician to the Philadelphia Hospital.

In one large and very handsome 8vo. *volume of* 733 *pages, with over* 200 *illustrations; cloth*, $4 50; *leather*, $5 50.

AUTHOR'S PREFACE.

The publication of a third American edition of his work affords the author an opportunity, of which he gladly avails himself, of expressing the great gratification which he has experienced in the generous appreciation of his labors by his colleagues in America. Of the many criticisms which have appeared, none have been more valuable or useful to him than those of the American medical press. The methods of teaching on the two sides of the Atlantic being somewhat different, it has been found necessary to make some modifications in order to make this and the previous edition quite intelligible. This has been ably done by Dr. John S. Parry; and, without committing himself to all that has been added, the author has much pleasure in acknowledging the courtesy and ability with which this task has been performed. In the preparation of the present edition, such alterations and modifications have been made as the progress of Obstetrical Science seems to require. The large circulation which the work has attained has, indeed, imposed this duty upon the author as one to be conscientiously and carefully discharged, and in its performance he has been under many obligations to Dr. James Finlayson, which he has much pleasure in acknowledging.

A few notices of the previous edition are subjoined.

Leishman's "System" is unquestionably one of the best modern text-books, and, until Playfair's volume appeared, was the only complete and systematic treatise representing the views of modern midwifery. The author's exposition of the mechanism of labor is the most lucid and accurate we have seen. It is essentially a practical treatise, ample in its descriptions, clear in its teaching, and dealing not only with the science, but also the art of obstetrics. The engravings are well executed, and serve materially to assist the student in comprehending the descriptions in the text.—*Lond. Med. Examiner*, Sept. 8, 1877.

But the most valuable additions to the volume are those made by the American editor. One of the best tests of a man's ability is for him to take a standard work in our profession, like this of Dr Leishman, and materially improve it. Many a one, with more ambition than wisdom, has attempted it with other books and failed. But Dr. Parry has succeeded most admirably. We know no obstetrical work that has anything better on the use of the forceps than that which Dr. Parry has given in this, and no work that has the rational and intelligent views upon lactation with which he has enriched this. Having used "Leishman" for two years as a text-book for students, we can cordially commend it, and are quite satisfied to continue such use now.—*Am. Practitioner*, March, 1876.

PLAYFAIR'S MIDWIFERY—New Edition—Just Ready.

A TREATISE ON THE SCIENCE AND PRACTICE OF MIDWIFERY.

By W. S. PLAYFAIR, M.D., F.R.C.P.,
Professor of Obstetric Medicine in King's College, etc.

Third American Edition, Revised by the Author.
EDITED, WITH ADDITIONS, BY ROBERT P. HARRIS, M.D.,

In one very handsome octavo volume of about 700 *pages, with nearly* 200 *illustrations.*

EXTRACT FROM THE AUTHOR'S PREFACE.

The second American edition of my work on Midwifery being exhausted before the corresponding English edition, I cannot better show my appreciation of the kind reception my book has received in the United States than by acceding to the publisher's request that I should myself undertake the issue of a third edition. As little more than a year has elapsed since the second edition was issued, there are naturally not many changes to make, but I have, nevertheless, subjected the entire work to careful revision, and introduced into it a notice of most of the more important recent additions to obstetric science. To the operation of gastro-elytrotomy—formerly described along with the Cæsarean section—I have now devoted a separate chapter. The editor of the second American edition, Dr. Harris, enriched it with many valuable notes, of which, it will be observed, I have freely availed myself.

A few notices of the previous edition are subjoined.

The best work on the subject ever published in the English language. It is written in a clear, pleasant style, without that verbosity which characterizes some modern and highly pretentious works. The author is quite up with the times, both in practice and theory. It is the best text-book we have for students, and sufficiently full of detail to supply all the wants of the practitioner. We would gladly see it in the hands of all who practise midwifery.—*Canadian Journ. of Med. Sci.*, Nov. 1878.

We record the speedy appearance of a second edition of this work with pleasure and gratification, because it sustains and justifies the high opinion expressed of its merits two years ago. There has been a general unanimity of opinion in the profession as to the high character of Dr. Playfair's work, both as a manual for the student, and a book of reference for the practitioner; and the revision and additions made to the second edition will not lower this favorable estimate of it. The additions made by Dr. Harris are of such a character as to make us wish they were more in number and greater in extent.—*Am. Journ. of Med. Sciences*, Jan. 1879.

BRISTOWE'S PRACTICE—New Edition—Just Ready.

A TREATISE
ON THE
THEORY AND PRACTICE OF MEDICINE

By JOHN SYER BRISTOWE, M.D., F.R.C.P.,
Physician and Joint Lecturer on Medicine, St. Thomas's Hospital,

Second American Edition, Revised by the Author.

EDITED, WITH ADDITIONS, BY

JAMES H. HUTCHINSON, M.D.,
Physician to the Pennsylvania Hospital.

In one large and handsome octavo volume of nearly 1100 *closely printed pages, with illustrations; cloth,* $5 00; *leather,* $6 00.

In reprinting this work from the recent thoroughly revised second English edition, th author has made such corrections as seemed advisable, and has added a chapter on Insanit The Editor has likewise revised his additions in the light of the latest experience, and th work is presented as reflecting in every way the most modern aspect of medical science, an as fully entitled to maintain the distinguished position accorded to it on both sides of th Atlantic as an authoritative guide for the student, and a complete though concise book reference for the practitioner. Notwithstanding the author's earnest effort at compressio the additions have amounted to about one-tenth of the previous edition; but by the use an enlarged page these have been accommodated without increasing the size of the volume while a reduction in the price renders it one of the cheapest works accessible to the profession

A few notices of the first edition are subjoined.

Upon the whole, we know of no work which we could more confidently recommend to the student or the practitioner, intending a review of the field of theory and practice, than this book of Dr. Bristowe's. We thus commend it, because the vast array of facts pertaining to the practice of medicine, as it is to-day, are here presented ably, and with that method, order, and perspicuity which, in all departments of education, distinguish the lessons of an acceptable and profitable teacher. — *Chicago Med. Journ. and Examiner*, Aug. 1877.

This portly volume is a marvel of condensation. In a style at once clear, interesting, and concise, Dr. Bristowe passes in review every conceivable subject connected with the practice of medicine. Those practitioners who purchase few books will find this a most opportune publication, because so many topics not usually embraced in a work on practice are adequately handled. The book is a thoroughly goo one, and its usefulness to American readers has bee increased by the judicious notes of the Editor.—*Cincinnati Clinic*, Jan. 7, 1877.

The above is an entirely new work on the practic of medicine. From the widely known and well earned reputation of the author, this work is en titled to the highest consideration. It is eminentl practical, and contains the most recent views on th pathology and treatment of diseased condition We cannot commend it too highly.—*Canada Lan cet*, Jan. 1, 1877.

Any one who wants a good, clear, condensed wor upon Practice, quite up with the most recent views i pathology, will find this a most valuable work. Th additions made by Dr. Hutchinson are appropriat and useful, and so well done that we wish there wer more of them.—*Am. Practitioner*, Feb. 1877.

FARQUHARSON'S THERAPEUTICS—New Edition—Now Ready.

A GUIDE TO THERAPEUTICS AND MATERIA MEDICA.

By ROBERT FARQUHARSON, M.D.,
Lecturer on Materia Medica at St. Mary's Hospital Medical School.

SECOND AMERICAN EDITION, REVISED BY THE AUTHOR.

ENLARGED AND ADAPTED TO THE U. S. PHARMACOPŒIA BY FRANK WOODBURY, M.D
Physician to the German Hospital, Philada.

In one handsome 12*mo. volume of* 498 *pages; cloth,* $2 25.

If there is any book on a medical subject more useful to the medical practitioner than this one we have yet to learn it. In our opinion, the student who has possessed himself of its contents is competent to enter upon the practice of his profession: and the busy practitioner who keeps it close at hand may feel that in it he has a trustworthy and ready friend and guide to follow.—*N. O. Med. Journal*, June, 1879.

We still hold to the opinion that this book is the most convenient manual for the young and intelligent practitioner on account of the side-by-side arrangement of the comparative results of physiological action and clinical experiences. Thus at a glance the indications for treatment of a troublesome set of symptoms may be seen. The occasional introduction of formulæ is very convenient, and oftentimes suggests original combinations of remedies.—*Boston Med. and Surg. Journal*, Aug. 21, 1879.

The volume is full of excellent teaching and sound practical instruction, and the physician who wishes to review the subject of Therapeutics will find this a valuable and interesting work to read. A perusal of this book will certainly benefit any one who will study it carefully as he reads.—*St. Louis Courier of Medicine*, July, 1879.

As a text-book for the student and equally as much as a book of reference for the practitioner, Dr. Farquharson's volume will be found one of the most generally useful and reliable yet published.—*Canada Med. and Surg. Journal*, July, 1879.

It is a carefully written and admirably arranged book, well adapted to instruct and please the reader. —*Md. Med. Journal*, July, 1879.

The arrangement of this work is excellent, enabling one almost at a glance to acquire both the physiological and therapeutical action of the various medicines. It is adapted especially to suit the wants of American physicians, and promises to continue to grow in popularity. The editor, Dr. Frank Woodbury, deserves not a small share of the credit, for the masterly manner in which he has executed his part of the task.—*Nashville Med. and Surg Journ.*, Sept. 1879.

EMMET ON DISEASES OF WOMEN—Now Ready.

THE PRINCIPLES AND PRACTICE OF GYNÆCOLOGY,

FOR THE USE OF STUDENTS AND PRACTITIONERS OF MEDICINE.

BY THOMAS ADDIS EMMET, M.D.,
Surgeon to the Woman's Hospital, New York, etc.

In one large and very handsome octavo volume of 856 *pages, with* 130 *illustrations; cloth*, $5; *leather*, $6.

The fame of Dr. Emmet for skill in gynæcological surgery is already known in this country, as well as in America. He has, moreover, enjoyed almost unrivalled opportunities both of observation and practical experience in the diseases peculiar to women, having been for twenty-five years surgeon to the woman's hospital of New York, and having conducted a private hospital for the last sixteen years. A large and comprehensive work on gynæcology by such an author will be read with the greatest interest by all who are concerned with the diseases of women. The strong individuality of the author is everywhere prominent, and the extensive records of personal experience contained in the book are most valuable.—*Obstet. Journ. of Gt. Britain and Ireland*, Nov. 1879.

From the high reputation of the author, Dr. Emmet's book was secure of a hearty welcome from the moment of its first announcement. Nor has it disappointed the anticipations of his friends. As the record of an experience such as is seldom given to one man, it must always stand as a classic in gynæcological literature.—*St. Louis Archives of Med.*, Aug. 1879.

No general practitioner or student of gynæcology can afford to be without this volume, for the exceptionally large experience of the author, whose rich and ripe results are embodied in every chapter, and the concise and yet comprehensive manner in which each subject is handled, giving the details of treatment throughout, leave no doubt in the reader's mind what is the author's belief, or of the manner in which he puts his belief in practice.—*Philada. Med. Times*, Aug. 9, 1879.

The treatise is of a thoroughly practical character, and is interesting as the record of labor performed by an indefatigable, earnest, able, and original gynæcologist.—*Lond. Med. Times and Gaz.*, Aug. 1879.

It may be said that he has had opportunities for observation and experience, for unfettered and unrestrained experimentation, and for testing the value of the original and dazzling operations first proposed and performed by his illustrious predecessors before referred to, and for devising new operations and discovering pathological causes never before suspected or described, which no man in the profession has ever before secured. We also think that the readers of this work will agree with us, after its careful perusal, that he has a rare capacity for discriminating analysis, and generally for philosophical deduction and the equally important quality of patient, honest, continued work. For the work as a whole, we have only praise. It deserves and will receive the careful study of all who desire to keep on a level with the progress of Gynæcology. It embodies a larger amount of carefully analyzed personal experience in a unique field for observation than any volume on Diseases of Women which has yet been published. Its great merit consists in this—coming as it does from a thoroughly honest, competent, and able specialist, who became a specialist only after an excellent training and experience as a general hospital physician and surgeon. The book is not one to be hastily glanced over, but will secure the critical study of Gynæcologists. Not only its style, which is individual and somewhat peculiar, but the new facts which it brings out, its original suggestions, its numerous and important statistical tables, and, in some instances, its unexpected deductions, will compel attention, and will form the basis for a great deal of Gynæcological study and literature in the future. All who make themselves familiar with the contents of this volume, will feel assured that Dr. Emmet has well earned and well deserved the reputation which he has already won, as one of the great Gynæcologists of the present age.—*The Am. Journal of Obstetrics*, April, 1879.

It is safe to assert that no medical book has issued from the press for many years, the appearance of which has been awaited with so much interest as this. We chronicle the appearance of the work with pleasure, and tender to the author our congratulations on the completion of his task. It is pre-eminently an original book. We commend it to the profession with the assurance that it is well worthy of their most careful consideration.—*Am. Journ. of Med. Sci.*, July, 1879.

ELLIS'S DEMONSTRATIONS OF ANATOMY—Just Ready.

DEMONSTRATIONS OF ANATOMY; being a Guide to the Knowledge of the Human Body by Dissection. By GEORGE VINER ELLIS, Emeritus Prof. of Anatomy in Univ. College, London. From the eighth and revised London edition. In one very handsome octavo volume of over 700 pages, with 256 illustrations; cloth, $4 25; leather, $5 25.

Ellis's Demonstration is the favorite text-book of the English student of anatomy. In passing through eight editions it has been so revised and adapted to the needs of the student that it would seem that it had almost reached perfection in this special line. The descriptions are clear and the methods of pursuing anatomical investigations are given with such detail that the book is honestly entitled to its name.—*St. Louis Clinical Record*, June, 1879.

For practical work in Anatomy the most complete and trustworthy is Prof. Ellis's "Demonstrations of Anatomy," which has stood the test of quite a generation of students, and is apparently as much appreciated as ever.—*Lond. Lancet*, Sept. 13, 1879.

On the whole, we commend the work as probably the most complete of its kind in our language, adapted to the needs of all, but containing for the average student, perhaps, an embarrassment of riches.—*Chicago Med. Journ. and Examiner*, Sept. 1879.

The merit of this book, which its seven editions in England amply attest, lies in its thoroughness and truthfulness. It is written by an eminent practical anatomist, and is absolutely reliable. This edition is issued in a very convenient octavo form, has plenty of good illustrations, and contains the most recent additions to our knowledge of the anatomy of the brain and spinal cord. It is, in our opinion, by far the best book on the subject in our language.—*N. Y. Med. Journ.*, July 1, 1879.

A full and complete work, embracing all that an advanced student requires in the dissecting room, not excepting the microscopic structure of the organs. We do not see in what it could be improved.—*Pacific Med. and Surg. Journ.*, July, 1879.

Students may rely on its instructions and delineations, and practitioners will find it valuable for reference in regional and surgical anatomy, as well as satisfactory for general instruction in its method of teaching.—*Am. Practitioner*, July, 1879.

As a work in the hands of a practical anatomist, it supplies every want. The general method observed in the description of the various structures and organs of the human body is at once complete and judicious. It possesses the merit of great comprehensiveness with marked exactitude of description. We bespeak for it the same large share of support from all students of anatomy that it has hitherto enjoyed. Few men of science have set before them a more worthy object of intellectual effort, and fewer have completed their work with like fidelity and ability.—*Canada Journ. of Med. Sci.*, Aug. 1879.

BARNES' MIDWIFERY—Just Ready.

A MANUAL OF MIDWIFERY FOR MIDWIVE

By FANCOURT BARNES, M.D.,
Physician to the General Lying-in Hospital, London.

In one neat royal 12*mo. volume of* 200 *pages, with* 50 *illustrations; cloth*, $1 25.

It is the best work of its size with which we are acquainted, and will doubtless supply a want long felt by the student of midwifery, as well as prove useful to practitioners, who may desire to refresh their memories upon the subjects of which it treats, with the smallest expenditure of time and research.—*Southern Practitioner*, Oct. 1879.

A book produced under such favorable auspices as this, affords, beforehand, guarantees of success. This manual sets forth in plain language, and with a full appreciation of the wants of students beginning the study of the principles and practice of midwifery, all that is essential to know in respect to the management of labors which do not require operative interference. The chapter on the management of lying in is well worth the attention of the most experienced practitioner; and the chapters on placenta prævia and hemorrhage, during and after delivery, are full of good sense, and evidence the habit of sound practice. It is likely to be as popular with students as with midwives.—*British Med. Journ.*, Oct. 1879.

The style is clear and concise, and much better adapted to the comprehension of the student during his first year, than the more pretentious stand works. The descriptions of the mechanism, stages and management of labor, are the simpl and most clear that we have seen; we fancy ma students will avail themselves of its pages dur their first course. The book is well worth the att tion of students, and will help to the understand of those principles and precepts which they find difficult.—*Canada Journ. of Med. Sci.*, Oct. 18

All must admit the necessity for the proper struction of midwives: hence this book supplie want long apparent to those who come in cont with them, and furnishes just what it is essent for them to know. It will also prove invalua to the student.—*Md. Med. Journ.*, Oct. 1879.

In accordance with his object, Dr. Barnes has formed his task admirably.—*Detroit Lancet*, 1879.

This volume covers well the ground it profes to occupy, and, though short, is still very conc and thorough. The different forms of labor clearly described, as also their appropriate tre ment.—*Canada Med. and Surg. Journ.*, Oct. 18

SEILER ON THE THROAT—Now Ready.

HANDBOOK OF DIAGNOSIS AND TREATMENT OF DISEASES OF THE THROAT A NASAL CAVITIES. By Carl Seiler, M.D., Lecturer on Laryngoscopy in the Univ. Penna., Chief of the Throat Dispensary at the Univ. Hospital, Phila. In one handso royal 12mo. volume of 156 pages, with 35 illustrations. Cloth, $1.

The intention of the author expressed in the preface, to make this little book "serve as a guide to students of laryngoscopy in acquiring the skill requisite to the successful diagnosis and treatment of diseases of the larynx and naso-pharynx," has been most ably carried out. We most heartily commend this book as showing sound judgment in practice, and perfect familiarity with the literature of the specialty it so ably epitomizes.—*Philada. Medical Times*, July 5, 1879.

It is eminently practical, clear and concise, evidently the work of a close observer and able teacher. This little volume offers a ready means of acquiring a knowledge of the diseases of the larynx and pharynx, and the busy practitioner will find is a useful book for reference on the subjects of which it treats.—*So. Practitioner*, Sept. 1879.

A convenient little handbook, clear, concise, a accurate in its method, and admirably fulfilling purpose of bringing the subject of which it tre within the comprehension of the general prac tioner.—*N. C. Med. Journ.*, June, 1879.

We can heartily commend this volume to the me ical student as a good guide to the study of laryn scopy and rhinoscopy penned by the hand of gentleman fully familiar with the subject of wh he writes.—*N. Y. Med. Record*, July 19, 1879.

The author has produced a most useful book, clear and reliable as it is concise. For use in co nection with clinical study this little work w prove trustworthy and convenient.—*Detroit La cet*, Aug. 1879.

FOX ON DISEASES OF THE SKIN—New Edition—Now Ready.

EPITOME OF SKIN DISEASES, WITH FORMULÆ; for Students and Practitioners. Tilbury Fox, M.D., F.R.C.P., Physician to Department of Skin Diseases, Universi College Hospital, and T. C. Fox, B.A., M.R.C.S. Second edition, thoroughly revised a greatly enlarged. In one very handsome 12mo. volume of about 250 pages; cloth, $1

The names of the authors are sufficient indorsement of the reliability of the work, and in the narrow range to which epitomized works are confined, this deserves a high place.—*N. Y. Med. Record*, July 9, 1879.

We have much pleasure in strongly recommending for the careful study of our readers this excellent little book. This, the second American, is a decided improvement on the English edition, for it contains an excellent summary on the difference in skin disease found in America and those found in England. The most useful part of the book to the everyday practitioner will doubtless be the Cutaneous Pharmacopœia appended. The last chapter on "Diet in Skin Diseases," demands very careful attention.—*Canada Med. and Surg. Journ.*, June, 1879.

The reputation of the distinguished authors of t little work is a sufficient guarantee of its standa character. It will prove invaluable as a work reference, and will take a high rank among t manuals now becoming so fashionable.—*Nash Med. and Surg. Journ.*, Sept. 1879.

For students, a better book was never devised. *Cincinnati Lancet and Clinic*, May 17, 1879.

The present edition of the Epitome considera exceeds in size, and surpasses in use, its predec sor. The work is certainly a valuable addition the "handy volume" department of medical lite ture.—*The Med. Bulletin*, May, 1878.

For students a better book was never devised. *Cincinnati Lancet and Clinic*, May, 1879.

ATTFIELD'S CHEMISTRY—New Edition—Now Ready.

CHEMISTRY; GENERAL, MEDICAL, AND PHARMACEUTICAL; including the Chemistry of the U. S. Pharmacopœia. A Manual of the General Principles of the Science and their Applications in Medicine and Pharmacy. By John Attfield, Ph.D., F.C.S., Professor of Practical Chemistry to the Pharmaceutical Society of Great Britain. Eighth edition, revised by the author. In one very handsome 12mo. volume of over 700 pages, with many illustrations; cloth, $2 50; leather, $3 00.

We have repeatedly expressed our favorable opinion of this work, and on the appearance of a new edition of it, little remains for us to say, except that we expect this eighth edition to be as indispensable to us as the seventh and previous editions have been. While the general plan and arrangement have been adhered to, new matter has been added covering the observations made since the former edition. The present differs from the preceding one chiefly in these alterations and in about ten pages of useful tables added in the appendix.—*Am. Jour. of Pharmacy*, May, 1879.

A standard work like Attfield's Chemistry need only be mentioned by its name, without further comments. The present edition contains such alterations and additions as seemed necessary for the demonstration of the latest developments of chemical principles, and the latest applications of chemistry to pharmacy. The author has bestowed anxious labor on the revision, and the extent of the information thus introduced may be estimated from the fact that the index contains three hundred new references relating to additional material.—*Druggists' Circular and Chemical Gazette*, May, 1879.

This very popular and meritorious work has now reached its eighth edition, which fact speaks in the highest terms in commendation of its excellence. It has now become the principal text-book of chemistry in all the medical colleges in the United States. The present edition contains such alterations and additions as seemed necessary for the demonstration of the latest developments of chemical principles, and the latest applications of chemistry to pharmacy. It is scarcely necessary for us to say that it exhibits chemistry in its present advanced state.—*Cincinnati Medical News*, April, 1879.

The popularity which this work has enjoyed is owing to the original and clear disposition of the facts of the science, the accuracy of the details, and the omission of much which freights many treatises heavily without bringing corresponding instruction to the reader. Dr. Attfield writes for students, and primarily for medical students; he always has an eye to the pharmacopœia and its officinal preparations; and he is constantly putting the matter in the text so that it responds to the questions with which each section is provided. Thus the student learns easily, and can always refresh and test his knowledge.—*Med. and Surg. Reporter*, April 19, 1879.

FOWNES' CHEMISTRY—New Edition—Just Issued.

MANUAL OF CHEMISTRY; Theoretical and Practical. By George Fownes, Ph.D. Revised and corrected by Henry Watts, B.A., F.R.S., author of "A Dictionary of Chemistry," etc. With a colored plate, and one hundred and seventy-seven illustrations on wood. A new American, from the twelfth and enlarged London edition. Edited by Robert Bridges, M.D. In one large royal 12mo. volume of over 1060 pages. Cloth, $2 75; leather, $3 25.

When we state that, in our opinion, the present edition sustains in every respect the high reputation which its predecessors have acquired and enjoyed, we express therewith our full belief in its intrinsic value as a text-book and work of reference.—*Am. Journ. of Pharm.*, Aug. 1878.

The conscientious care which has been bestowed upon it by the American and English editors renders it still, perhaps, the best book for the student and the practitioner who would keep alive the acquisitions of his student days. It has, indeed, reached a somewhat formidable magnitude with its more than a thousand pages, but with less than this no fair representation of chemistry as it now is can be given. The type is small but very clear, and the sections are very lucidly arranged to facilitate study and reference.—*Med. and Surg. Reporter*, Aug. 3, 1878.

The work is too well known to American students to need any extended notice; suffice it to say that the revision by the English editor has been faithfully done, and that Professor Bridges has added some fresh and valuable matter, especially in inorganic chemistry. The book has always been a favorite in this country, and in its new shape bids fair to retain all its former prestige.—*Boston Journ. of Chemistry*, Aug. 1878.

As a manual of chemistry it is without a superior in the language.—*Md. Med. Journ.*, Aug. 1878.

No text-book of chemistry has probably fulfilled its mission so admirably, in any country, as the excellent handbook of Fownes. It will be unnecessary to specify the many additions and changes made in the text of the work, for any one acquainted with the progress of chemistry during the last nine years will be able to realize it. The English edition being in two volumes, has been condensed into one by the selection of a small, but very clear type. The work is very clearly edited and printed, and has still a very handy size. We are sure that "*Fownes*" will remain the standard text book as long as the publishers will keep abreast of the progress of the science of chemistry.—*New Remedies*, Aug. 1878.

CLOWES'S CHEMISTRY—Just Issued.

AN ELEMENTARY TREATISE ON PRACTICAL CHEMISTRY AND QUALITATIVE INORGANIC ANALYSIS. Specially adapted for Use in the Laboratories of Schools and Colleges, and by Beginners. By Frank Clowes, D.Sc. London, Senior Science Master at the High School, Newcastle under-Lyme, etc. With about fifty illustrations on wood. From the second and revised English edition. In one very handsome royal 12mo. volume of 376 pages; cloth, $2 50.

BOWMAN'S PRACTICAL CHEMISTRY—Lately Issued.

INTRODUCTION TO PRACTICAL CHEMISTRY, INCLUDING ANALYSIS. By John E. Bowman, M.D. Sixth American, from the sixth and revised English edition. Edited by Charles L. Bloxam, Professor of Chemistry in King's College, London. In one royal 12mo. volume of 340 pages. With 98 illustrations; cloth, $2 25.

BRYANT'S SURGERY—New Edition—Now Ready.

THE PRACTICE OF SURGERY.

By THOMAS BRYANT, F.R.C.S.,

Surgeon to Guy's Hospital.

SECOND AMERICAN, FROM THE THIRD AND REVISED ENGLISH EDITION.

In one large and very handsome imperial octavo volume of over 1000 *large and closely printed pages, with* 672 *illustrations; cloth*, $6; *leather*, $7.

It is rare that a work undergoes so much alteration as this has done in passing from the first to the second edition, but this change represents that effected by three English editions. The chief value of this particular surgery lay originally in its very practical character, being largely a record of the author's experience, which in a hospital like Guy's was of course of just the character to illustrate a text-book. This feature has been preserved, while the arrangements of the subjects and the literary part of the work have undergone great improvements. There was room for it, but the want has been very satisfactorily filled. Another valuable feature is the beautiful illustrations, which are a model of what ought to be, but unfortunately rarely is, in every medical work.—*Boston Med. and Surg. Journal*, Sept. 25, 1879.

In this new and enlarged edition of Mr. Bryant's "Manual" we have one of the most complete treatises on the subject which has appeared in one volume. Much attention has been given to the description and illustration of methods of operating and subsequent management, apparatus, and results, and the introductory chapters on minor topics, which are commonly slighted, are quite full and satisfactory.—*New Remedies*, May, 1879.

The work before us is the American reprint of the last London edition, and has the advantage over the latter in being of more convenient size, and in being compressed into one volume. The author has rewritten the greater part of the work, and has succeeded, in the amount of new matter added, in making it markedly distinctive from previous editions. As a concise and practical manual of British surgery, it is perhaps without an equal, and will doubtless always be a favorite text-book with the student and practitioner.—*N. Y. Medical Record*, March 22, 1879.

There are so many text-books of surgery, so many written by skilled and distinguished hands, that to obtain the honor of a third edition in England is no light praise. Mr. Bryant merits this, by clearness of style, and good judgment in selecting the operations he recommends. In his new editions he goes carefully over the old grounds, in light of later research. On these and many allied points Mr. Bryant is a calm and unpartisan observer, and his book throughout has the great merit of maintaining the true scientific, judicial tone of mind.—*Med. and Surg. Reporter*, March 22, 1879.

The book, on the whole, is entitled to the highest praise, for it is eminently practical, and the teachings it contains are, in a great degree founded on the personal experience of its distinguished author with the accorded observation and practice of his colleagues and predecessors. The difficult task of forming a judgment as to the relative merits of Bryant and Ashhurst we will not attempt, but predict that, considering the high excellence of both, many others will likewise be forced to hesitate long in making choice between them.—*Cincinnati Lancet and Clinic*, March 22, 1879.

ASHHURST'S SURGERY—New Edition—Just Issued.

THE PRINCIPLES AND PRACTICE OF SURGERY. By JOHN ASHHURST, Jr., M.D., Prof. of Clinical Surgery in the Univ. of Penna.; Surgeon to the Episcopal Hospital, Philada. Second edition, revised and enlarged. In one very handsome octavo volume of over 1000 pages, with 542 illustrations; cloth, $6; leather, $7.

Dr. Ashhurst's Surgery is as compact and comprehensive a treatise as any to be found in the English language. It is emphatically a text-book, and one particularly well adapted for the use of students. The author's well known familiarity with the whole domain of surgical literature gives his writings a peculiar value; evidences of this are seen on almost every page. We find mention of many of the rarer forms of surgical disease, with due appreciation of their true character, such as, for instance, perforating ulcer of the foot. The latest contributions to practical surgery are embodied in this edition, and due attention is always paid to original investigations of others. We can safely recommend Dr. Ashhurst's work as one of the best books that we know of to place in the hands of the beginner, to say nothing of many features which make it valuable to the oldest students of the art for reference.—*Boston Med. and Surg. Journal*, April 24, 1879.

This work certainly shows an extensive familiarity of its author with the current literature of the subjects embraced, for we find throughout abundant references to articles which have appeared very recently in the journals from American writers, and in this respect there is a notable difference between it and most other surgical treatises which have appeared of late in this country. Throughout the text will be found a vein of individuality and an evidence of appreciation on the part of its author of the salient points of his subjects which will render the book suggestive and valuable even to one who has other treatises on the same subject.—*New Remedies*, May, 1879.

Conscientiousness and thoroughness are two very marked traits of character in the author of this book. Out of these traits largely has grown the success of his mental fruit in the past, and the present offer seems in no wise an exception to what has gone before. The general arrangement of the volume is the same as in the first edition, but every part has been carefully revised, and much new matter added.—*Philada. Med. Times*, Feb. 1, 1879.

We have previously spoken of Dr. Ashhurst's work in terms of praise. We wish to reiterate those terms here, and to add that no more satisfactory representation of modern surgery has yet fallen from the press. In point of judicial fairness, of power of condensation, of accuracy and conciseness of expression and thoroughly good English, Prof. Ashhurst has no superior among the surgical writers in America.—*Am. Practitioner*, Jan. 1879.

HAMILTON ON FRACTURES—Lately Issued.

A PRACTICAL TREATISE ON FRACTURES AND DISLOCATIONS By FRANK HASTINGS HAMILTON, A.M., M.D., LL.D., Surgeon to Bellevue Hospital Medical College, New York; Consulting Surgeon to Hospital for Ruptured and Cripples; to St. Elizabeth's Hospital, etc. Fifth edition, revised and improved. In one handsome octavo volume of 832 pages, with three hundred and forty-four wood-cuts; cloth, $5 75; leather, $6 75.

ERICHSEN'S SURGERY—New Edition—Just Issued.

THE SCIENCE AND ART OF SURGERY; being a Treatise on Surgical Injuries, Diseases and Operations. By **John Eric Erichsen**, Prof. of Surgery in Univ. College, London, Carefully revised by the author from the Seventh and enlarged English edition. With 86 illustrations. In two large and beautiful octavo volumes of nearly 2000 pages; cloth, $8 50; leather, $10 50.

For the past twenty years Erichsen's Surgery has maintained its place as the leading text-book, not only in this country, but in Great Britain. That it is able to hold its ground, is abundantly proven by the thoroughness with which the present edition has been revised, and by the large amount of valuable material that has been added Aside from this, one hundred and fifty new illustrations have been inserted, including quite a number of microscopical appearances of pathological processes. So marked is this change for the better, that the work almost appears as an entirely new one.—*Med. Record*, Feb. 23, 1878.

Of the many treatises on Surgery which it has been our task to study, or our pleasure to read, there is none which in all points has satisfied us so well as the classic treatise of Erichsen. His polished, clear style, his freedom from prejudice and hobbies, his unsurpassed grasp of his subject, and vast clinical experience, qualify him admirably to write a model text-book. When we wish, at the least cost of time, to learn the most of a topic in surgery, we turn, by preference, to his work. It is a pleasure, therefore, to see that the appreciation of it is general, and has led to the appearance of another edition.—*Med. and Surg. Reporter*, Feb. 2, 1878.

Notwithstanding the increase in size, we observe that much old matter has been omitted. The entire work has been thoroughly written up, and not merely amended by a few extra chapters. A great improvement has been made in the illustrations. One hundred and fifty new ones have been added, and many of the old ones have been redrawn. The author highly appreciates the favor with which his work has been received by American surgeons, and has endeavored to render his latest edition more than ever worthy of their approval. That he has succeeded admirably must, we think, be the general opinion. We heartily recommend the book to both student and practitioner.—*N. Y. Med. Journal*, Feb. 1878.

This work is so long and favorably known to the profession, that nothing more is necessary than the simple announcement that a new edition of this standard work on surgery has been issued from the press. It cannot be spoken of too highly, both as a text-book for medical students, and a work of reference for the practical surgeon. We have often had occasion to consult this classical work, and never have been disappointed either in the matter of advice or suggestion which it contains. It should be in the hands of every medical practitioner.—*Canada Lancet*, March 1, 1878.

We can close our remarks with a hearty recommendation of the book to students and practitioners as being the very best they can buy.—*Boston Med. and Surg. Journ.*, May 9, 1878.

HOLMES'S SURGERY—Lately Issued.

SURGERY, ITS PRINCIPLES AND PRACTICE. By **Timothy Holmes**, Surgeon to St. George's Hospital, London. In one handsome volume of nearly 1000 pages. With 411 illustrations; cloth, $6; leather, $7.

This is a work which has been looked for on both sides of the Atlantic with much interest. Mr. Holmes is a surgeon of large and varied experience, and one of the best known, and perhaps the most brilliant writer upon surgical subjects in England. It is a book for students—and an admirable one—and for the busy general practitioner. It will give a student all the knowledge needed to pass a rigid examination. The book fairly justifies the high expectations that were formed of it. Its style is clear and forcible, even brilliant at times, and the conciseness needed to bring it within its proper limits has not impaired its force and distinctness.—*N. Y. Med. Record*, April 14, 1876.

We believe it to be by far the best surgical text book that we have, insomuch as it is the completest, and the one most thoroughly brought up to the knowledge of the present day. All who will give the book the careful perusal that it deserves and requires, whether student or practitioner, will agree with us that from the happy way in which justice is done, both to the principles and practice of surgery, from the care with which its pages are brought up to modern date, from the respect which is paid all along to the opinions of others, it deserves to take the first place among the text-books on surgery.—*British Med. Journ.*, December 25, 1875.

It will be found a most excellent epitome of surgery by the general practitioner who has not the time to give attention to more minute and extended works and to the medical student. In fact, we know of no one we can more cordially recommend. The author has succeeded well in giving a plain and practical account of each surgical injury and disease, and of the treatment which is most commonly advisable. It will no doubt become a popular work in the profession, and especially as a text-book.—*Cincinnati Med. News*, April, 1876.

STIMSON'S OPERATIVE SURGERY—Now Ready.

A MANUAL OF OPERATIVE SURGERY. By **Lewis A. Stimson**, A.M., M.D., Surgeon to the Presbyterian Hospital, New York. Prof. of Pathological Anatomy in the Medical Faculty of the Univ. of New York. In one very handsome royal 12mo. volume of about 500 pages. With 332 illustrations; cloth, $2 50.

Stimson's Manual is fully illustrated with wood engravings; they are correct, and very serviceable. The descriptions are thoroughly practical, and the subsidiary points of the exact position of the patient, the duties of assistants, and so forth, receive their due attention, and we are sure this work will be useful and well received here.—*London Lancet*, Sept. 27, 1879.

This is by far one of the best manuals of surgery, as applied to operations, that it has been our privilege to read for several years. An astonishingly large amount of matter is condensed into these four hundred and eighty-eight pages. It combines in an eminent degree the qualities of a condensed text-book and a work of ready reference. It is *replete* with handsome illustrations, and has the advantage of being easily comprehended, so reasonable and practical is the mode in which the various subjects are systematized and presented. It is a type of the *multum in parvo* principle, which at times is so essential to the busy practitioner, who needs speedy refreshing on some special point. The work is brought up to date, and Dr. Stimson deserves the thanks of the profession for supplying so well a want long felt by the progressive medical man.—*So. Practitioner*, Jan. 1879.

The work before us is a well printed, profusely illustrated manual of over four hundred and seventy pages. The novice, by a perusal of the work, will gain a good idea of the general domain of operative surgery, while the practical surgeon has presented to him within a very concise and intelligible form the latest and most approved selections of operative procedure. The precision and conciseness with which the different operations are described enable the author to compress an immense amount of practical information in a very small compass.—*N. Y Medical Record*, Aug. 3, 1878.

GROSS'S SURGERY—New Edition—Lately Issued.

A SYSTEM OF SURGERY;

PATHOLOGICAL, DIAGNOSTIC, THERAPEUTIC, AND OPERATIVE.

By SAMUEL D. GROSS, M.D.,
Professor of Surgery in Jefferson Medical College of Philadelphia.

Illustrated by upwards of Fourteen Hundred Engravings on Wood. Fifth Edition, carefully Revised, and Improved.

In two large and beautifully printed imperial octavo volumes, of about 2300 *pages, strongly boun in leather, with raised bands.* $15.

We have now brought our task to a conclusion, and have seldom read a work with the practical value of which we have been more impressed. Every chapter is so concisely put together that the busy practitioner, when in difficulty, can at once find the information he requires. His work is cosmopolitan, the surgery of the world being fully represented in it. The work, in fact, is so historically unprejudiced, and so eminently practical, that it is almost a false compliment to say that we believe it to be destined to occupy a foremost place as a work of reference, while a system of surgery like the present system of surgery is the practice of surgeons. The printing and binding of the work is unexceptionable; indeed, it contrasts, in the latter respect, remarkably with English medical and surgical cloth bound publications which are generally so wretchedly stitched as to require re-binding before they are any time in use.—*Dublin Jour. of Medicine*, March, 1874.

Gross's Surgery is as well known to the profession both in America and Europe, as the Bible is to Christians or the Koran to the disciples of Mohammed. A thoroughly studious, industrious man like the author, who has practised Surgery over forty years, and taught it over thirty, could not fail to make the fifth edition of his work a perfect encyclopædia of surgery, embodying all that is valuable in the surgical literature of both hemispheres.—*Pacific Med. and Surg. Journal*, Sept. 1872.

It combines, as perfectly as possible, the qualities of a text-book and work of reference. We think this last edition of Gross's "Surgery" will confirm his title of "*Primus inter Pares.*" It is learned, scholar-like, methodical, precise, and exhaustive. We scarcely think any living man could write so complete and faultless a treatise, or comprehend more solid, instructive matter in the given number of pages. The labor must have been immense, and the work gives evidence of great powers of mind, and the highest order of intellectual discipline and methodical disposition and arrangement of acquire knowledge and personal experience.—*N. Y. Me Journ.*, Feb. 1873.

The two magnificent volumes before us afford very complete view of the surgical knowledge of th day. Some years ago we had the pleasure of pr senting the first edition of Gross's Surgery to th profession as a work of unrivalled excellence; an now we have the result of years of experience, l bor, and study, all condensed upon the great wor before us. And to students or practitioners desirou of enriching their library with a treasury of refe ence, we can simply commend the purchase of thes two volumes of immense research.—*Cincinna Lancet and Observer*, Sept. 1872.

This great American Surgery is justly a nationa pride, and its distinguished author a nationa honor. It is our American standard, and surgeon compare and estimate everything by it. It is ce tainly the most comprehensive, clear, and satisf tory surgical guide within reach of the surgeon an student. The illustrations are excellent and wel chosen; the text is clear and easily understood. I is extensive in its scope, and includes nearly ever surgical subject; in a word, it is a complete Syste of Surgery.—*Buffalo Medical and Surg. Journa* Sept. 1872.

Dr Gross's Surgery, a great work, has becom still greater, both in size and merit, in its most r cent form The difference in actual number pages is not more than 130, but, the size of the pag having been increased to what we believe is techn cally termed "elephant," there has been room f considerable additions, which, together with th alterations, are improvements.—*London Lance* Nov. 16, 1872.

A complete system of Surgery—not a mere text book of operations, but a scientific account of su gical theory and practice in all its departments.—*Brit. and For. Chir.-Med. Rev.*, Jan. 1872.

BY THE SAME AUTHOR—New Edition—Just Issued.

A PRACTICAL TREATISE ON THE DISEASES, INJURIES, AND MALFORMATION OF THE URINARY BLADDER, THE PROSTATE GLAND, AND THE URETHRA By SAMUEL D. GROSS, M.D., Professor of Surgery in the Jefferson Medical College Philadelphia. Third edition, thoroughly revised, by SAMUEL W. GROSS, M.D., Surgeo to the Philadelphia Hospital. In one handsome octavo volume of 574 pages, with one hundred and seventy illustrations; cloth, $4 75.

Professor Gross has written many books, and all of them good ones, but in our estimation, not one better than this treatise. And numerous as are the additions recently made in this department of surgery, we have never felt that anything superseded this work, so long an American standard and classic; and now that we have a new edition, carefully revised, we feel that it can safely challenge competition with any of its successors. Having long enjoyed an enviable reputation in this class of diseases, and having had an enormous experience therein, he has seen the rise and fall of many novelties, tested the value of most new plans of treatment, and is a reliable guide for those who ar just entering upon this department of practice.—*Ohio Med. and Surgical Journal*, Feb. 1877.

Every surgeon in the country will deem it neces sary to his library, and every physician who has troublesome case of urinary disease will consult i with advantage. On whatever subject Dr. Gros writes, it is well understood that he is exhaustive so that the reader may expect to find in this trea tise all of value that is known to the professio touching the affections considered in its pages.—*Am. Practitioner*, Dec. 1876.

BY THE SAME AUTHOR—Lately Issued.

A PRACTICAL TREATISE ON FOREIGN BODIES IN THE AIR-PASSAGES. In on octavo volume of 468 pages. With illustrations; cloth, $2 75.

BURNETT ON THE EAR—Just Issued.

THE EAR; ITS ANATOMY, PHYSIOLOGY, AND DISEASES.

A PRACTICAL TREATISE FOR THE USE OF MEDICAL STUDENTS AND PRACTITIONERS.

By CHARLES H. BURNETT, M.A., M.D.,
Aural Surgeon to the Presbyterian Hospital, Surgeon in Charge of the Infirmary for Diseases of the Ear, Philadelphia.

In one handsome octavo vol. of 615 *pages, with* 87 *illustrations; cloth*, $4 50; *leather*, $5 50.

Foremost among the numerous recent contributions to aural literature will be ranked this work of Dr Burnett. It is impossible to do justice to this volume of over 600 pages in a necessarily brief notice. It must suffice to add that the book is profusely and accurately illustrated, the references are conscientiously acknowledged, while the result has been to produce a treatise which will henceforth rank with the classic writings of Wilde and Von Trölsch.—*The Lond. Practitioner*, May, 1879.

Dr. Burnett's admirable treatise is characterized by a more ample discussion of the physics of the ear than is contained in the ordinary text-books, and the author is correct in his observation "that the pathology and therapeutics of the ear cannot be properly understood without a more intimate acquaintance with its anatomy and physiology." We think that he has done valuable service in giving prominence to this portion of his work. There is found so little for adverse criticism and so much to commend, that we submit Dr Burnett's book as one which should have a place in the library of every physician who wishes to be conversant with this department, and every physician should be informed—at least to a degree sufficient to protect his reputation, and to provide for the best interests of those who commit themselves in confidence to his professions. —*St. Louis Courier of Med.*, April, 1879.

On account of the great advances which have been made of late years in otology, and of the increased interest manifested in it, the medical profession will welcome this new work, which presents clearly and concisely its present aspect whilst clearly indicating the direction in which further researches can be most profitably carried on. Dr. Burnett from his own matured experience, and availing himself of the observations and discoveries of others, has produced a work which, as a text-book, stands *facile princeps* in our language We had marked several passages as well worthy of quotation and the attention of the general practitioner, but their number and the space at our command forbid. Perhaps it is better, as the book ought to be in the hands of every medical student, and its study will well repay the busy practitioner in the pleasure he will derive from the agreeable style in which many otherwise dry and mostly unknown subjects are treated To the specialist the work is of the highest value, and his sense of gratitude to Dr. Burnett will, we hope, be proportionate to the amount of benefit he can obtain from the careful study of the book, and a constant reference to its trustworthy pages.—*Edinburgh Med. Journ.*, Aug. 1878.

Almost all the known diseases of the ear are described in a thorough manner, and the treatment advised is judicious. Space would fail us here to analyze the many good qualities of the book, the many new and interesting investigations which are for the first time here incorporated in a text-book, the familiarity of the author with the literature of his subject, and the judicious selection which he has made from it, both in regard to pathology and treatment. The book, as a whole, we can most heartily commend as a very fair exponent of our otological knowledge, and a safe and reliable guide in practice. —*Boston Med. and Surg. Journ.*, Jan. 10, 1878.

CARTER ON THE EYE—Just Issued.

A PRACTICAL TREATISE ON DISEASES OF THE EYE. By R. BRUDENELL CARTER, F.R.C.S., Ophthalmic Surgeon to St. George's Hospital, etc. Edited, with Test-types and additions, by JOHN GREEN, M.D. (of St. Louis, Mo.). In one handsome octavo volume of about 500 pages, and 124 illustrations: cloth, $3 75.

It is especially a work for the general practitioner, who, without being able to master the special practice in eye diseases in all its details, yet requires a convenient manual that can inform him as to the nature of, and proper measures at his command for, the different ocular troubles which must be constantly coming under his observation. There are also features of many general affections, not perhaps usually considered as in any way connected with ocular troubles, that require more or less knowledge of the methods of diagnosis, etc., described in this volume, for the understanding of their real nature and many symptoms that can only be detected by these methods. We can cordially commend this volume to students and practitioners. The additions of the American editor are quite numerous, and seem to add to the value of the book.—*The Journ. of Mental and Nervous Disease*, Oct. 1876.

An author who has enjoyed an extended and abundant experience, both in private and hospital practice, and who is a thorough master of the theory and practice of his specialty, can scarcely fail to produce a valuable work, and such we consider this volume. We highly commend this work, and believe its clear description of disease, and its lucid explanation of the methods of diagnosis and treatment, will soon render a new edition necessary.—*Chicago Med. Journ and Exam.*, Nov. 1876.

BROWNE ON THE THROAT—Just Issued.

THE THROAT AND ITS DISEASES. By LENNOX BROWNE, F.R C.S ED., Senior Surgeon to the Central London Throat and Ear Hospital, etc. With one hundred typical illustrations in colors, and fifty wood engravings Designed and executed by the author. In one very handsome imperial octavo volume of 351 pages; cloth, $5.

Mr. Browne, who has long been known as a throat specialist in London, has given us an excellent text-book on the results of his large experience. The book bears evidence throughout of personal familiarity with the subjects treated, which is more than can be said of many so-called text-books. The more we look at the book, the more satisfactory it seems, and we heartily recommend it to the general profession —*Boston Med. and Surg. Journ.*, Jan. 2, 1879.

The author's rare artistic skill has been utilized in the production of one hundred beautiful illustrations in colors, the very best of the kind we have seen, and which have been distributed in ten plates. Fifty wood engravings, designed and executed by the author, appear in the body of the work—these are unusually accurate In conclusion, we recommend this beautiful volume as an acceptable addition to the library of those engaged in the treatment of diseases of the throat.—*N. Y. Med. Record*, Nov. 9, 1878.

In the full knowledge that good text-books upon the subject of which Mr. Browne has written already existed, we willingly record our judgment in favor of the excellence of the work that he has done, and can heartily recommend his book as one eminently suited to meet the wants of the class for whom it is designed, viz., those engaged in the active practice of their profession; and, we will add, he has done even more, he has produced an excellent manual for the student, and a valuable work of reference for the specialist, a criticism that we feel sure will be justified by an examination of the book in question, and borne out by many of the characteristics which it presents.—*Am. Journ. of Med. Science*, Oct. 1878.

GRAY'S ANATOMY—New Edition—Just Issued.

ANATOMY, DESCRIPTIVE AND SURGICAL.

By HENRY GRAY, F.R.S.,
Lecturer on Anatomy at St. George's Hospital, London.

The Drawings by H. V. Carter, M.D., and Dr. Westmacott. The Dissections jointly by the Author and Dr. Carter.

WITH AN INTRODUCTION ON GENERAL ANATOMY AND DEVELOPMENT, BY T. HOLMES, M.A., SURGEON TO ST. GEORGE'S HOSPITAL.

A NEW AMERICAN, FROM THE EIGHTH ENLARGED AND IMPROVED LONDON EDITION.

To which is added "LANDMARKS, MEDICAL AND SURGICAL."

By LUTHER HOLDEN, F.R.C.S., Author of "Human Osteology," "A Manual of Dissections," etc.

In one magnificent imperial octavo volume of nearly 1000 *pages, with* 522 *large and elaborate engravings on wood; cloth*, $6; *leather*, $7.

The most important difference between this and former editions is that Holden's book on "Landmarks" has been incorporated in the volume, making, in fact, two books in one, and this without any increase in the price. This is practically the anatomy that is most needed at the bedside, and cannot be too carefully studied and mastered by both the physician and the surgeon.—*Am. Journ. Med. Sciences*, Oct. 1878.

The recent work of Mr. Holden, which was noticed by us on p. 53 of this volume, has been added as an appendix, so that, altogether, this is the most practical and complete anatomical treatise available to American students and physicians. The former finds in it the necessary guide in making dissections; a very comprehensive chapter on minute anatomy; and about all that can be taught him on general and special anatomy; while the latter, in its treatment of each region, from a surgical point of view, and in the valuable addition by Mr. Holden, will find all that will be essential to him in his practice.—*New Remedies*, Aug. 1878.

The repeated editions of this work attest its continued popularity and substantial excellence. At the end of the volume proper is appended Mr. Luther Holden's little work on "Medical and Surgical Landmarks." This part of the volume should be thoroughly mastered so as to be produced under any circumstances. On the whole, it is a magnificent volume, especially adapted to medical students. Its style of issue is of the same liberal description as in former editions.—*Detroit Lancet*, Oct. 1878.

This work is as near perfection as one could possibly or reasonably expect any book intended as a text-book or a general reference book on anatomy to be. The American publisher deserves the thanks of the profession for appending the recent work of Mr. Holden, "*Landmarks, Medical and Surgical*," which has already been commended as a separate book. This latter work —treating of topographical anatomy—has become essential to the library of every intelligent practitione We know of no book that can take its place, written it is by a most distinguished anatomist. It would simply a waste of words to say anything further praise of Gray's Anatomy, the text-book in almo every medical college in this country, and the dai reference book of every practitioner who has occasio to consult his books on anatomy. The work is simp indispensable, especially this present American editio —*Va. Med. Monthly*, Sept. 1878.

We need not say a word in commendation of th great work. It is the text-book on anatomy; the is no attempt to equal, still less to rival it, and ca not be for many a day.—*Am. Practitioner*, Oct. '78

We are now assured that the work is as near pe fect as possible, and, as far as we are able from thorough examination to testify, we are quite con dent that the assertion is based upon fact. The pu lishers added considerably to the practical value the work by the incorporation of Holden's "Medic and Surgical Landmarks."—*N. Y. Med. Record*, Sep 21, 1878.

It is difficult to speak in moderate terms of th new edition of "Gray." It seems to be as near perfect as it is possible to make a book devoted any branch of medical science. The labors of th eminent men who have successively revised th eight editions through which it has passed, woul seem to leave nothing for future editors to do. Th addition of Holden's "Landmarks" will make it indispensable to the practitioner of medicine an surgery as it has been heretofore to the student. regards completeness, ease of reference, utilit beauty, and cheapness, it has no rival. No stude should enter a medical school without it; no ph sician can afford to have it absent from his librar —*St. Louis Clin. Record*, Sept. 1878.

HEATH'S ANATOMY—Lately Issued.

PRACTICAL ANATOMY; a Manual of Dissections. By CHRISTOPHER HEATH, F.R.C.S Teacher of Operative Surgery in University College, London. From the second revis and improved London edition. Edited, with additions, by W. W. KEEN, M.D., Lectur on Pathological Anatomy in the Jefferson Medical College, Philadelphia. In one han some royal 12mo. volume of 578 pages, with 247 illustrations. Cloth, $3 50; leather, $4

ANATOMICAL ATLAS.

AN ANATOMICAL ATLAS; Illustrative of the Structure of the Human Body. By HEN H. SMITH, M.D., Professor of Surgery in the Univ. of Penna., etc. and WILLIAM E. HO NER, M.D., late Prof. of Anatomy in the Univ. of Penna. In one volume, large imperi octavo, cloth, with about six hundred and fifty beautiful figures. $4 50.

WILSON'S ANATOMY.

A SYSTEM OF HUMAN ANATOMY, General and Special. By ERASMUS WILSON, F.R. Edited by W. H. GOBRECHT, M.D., Professor of General and Surgical Anatomy in th Medical College of Ohio. Illustrated with three hundred and ninety-seven engravings o wood. In one large and handsome octavo volume, of over 600 large pages; cloth, $ leather, $5.

THOMAS ON WOMEN—Lately Published.

A PRACTICAL TREATISE ON THE DISEASES OF WOMEN.

By T. GAILLARD THOMAS, M.D.,

Professor of Obstetrics and the Diseases of Women and Children in the College of Physicians and Surgeons, New York, etc.

WITH 191 ILLUSTRATIONS.

FOURTH EDITION, THOROUGHLY REVISED.

In one large and handsome volume of 800 *pages; cloth,* $5; *leather,* $6.

Dr. Thomas's work is a model of perfection, classical yet clinical in all its details; concise, yet ample in its description of disease, systematical, complete, and circumstantial. It is but five years since its first appearance, and already a fourth edition—a goodly octavo of 800 pages, with nearly 200 illustrations—has been called for. No wonder that the Germans, French, and Italians have deemed it worthy of translating into their own languages. The great charm of the work is that, under the one heading we are seeking, whether it be dysmenorrhœa, sterility, or metritis, we find everything we need, a veritable multum in *parvo.*—*Brit. and For. Med.-Chir. Rev.*, Jan 1876.

Reluctantly we are obliged to close this unsatisfactory notice of so excellent a work, and in conclusion would remark that, as a teacher of gynæcology, both didactic and clinical, Prof. Thomas has certainly taken the lead far ahead of his *confrères*, and as an author he certainly has met with unusual and merited success.—*Am. Jour. of Obstetrics*, Nov. 1874

This volume of Prof. Thomas in its revised form is classical without being pedantic, full in the details of anatomy and pathology, without ponderous translation of pages of German literature; describes distinctly the details and difficulties of each operation, without wearying and useless minutiæ, and is in all respects a work worthy of confidence, justifying the high regard in which its distinguished author is held by the profession.—*Am. Supplement Obstet. Journ.*, Oct. 1874.

A work which has reached a fourth edition, and that, too, in the short space of five years, has achieved a reputation which places it almost beyond the reach of criticism, and the favorable opinion which we have already expressed of the former editions seems to require that we should do little more than announce this new issue. We cannot refrain from saying that, as a practical work, this is second to none in the English, or, indeed, in any other language. The arrangement of the contents, the admirably clear manner in which the subject of the differential diagnosis of several of the diseases is handled, leave nothing to be desired by the practitioner who wants a thoroughly clinical work, one to which he can refer in difficult cases of doubtful diagnosis with the certainty of gaining light and instruction. Dr. Thomas is a man with a very clear head and decided views, and there seems to be nothing which he so much dislikes as hazy notions of diagnosis and blind routine and unreasonable therapeutics. The student who will thoroughly study this book and test its principles by clinical observation, will certainly not be guilty of these faults. —*London Lancet*, Feb. 13, 1875.

Professor Thomas fairly took the profession of the United States by storm when his book first made its appearance early in 1868 Its reception was simply enthusiastic notwithstanding a few adverse criticisms from our transatlantic brethren, the first large edition was rapidly exhausted, and in six months a second one was issued, and in two years a third one was announced and published, and we are now promised the fourth. The popularity of this work was not ephemeral, and its success was unprecedented in the annals of American medical literature. Six years is a long period in medical scientific research, but Thomas's work on "Diseases of Women," is still the leading native production of the United States. The order, the matter, the absence of theoretical disputativeness, the fairness of statement, and the elegance of diction, preserved throughout the entire range of the book, indicate that Professor Thomas did not overestimate his powers when he conceived the idea and executed the work of producing a new treatise upon diseases of women.—Prof. PALLEN, in *Louisville Med. Journ.*, Sept. 1874.

The latest edition of this well-known text book retains the essential characters which rendered the earliest so deservedly popular. It is still pre-eminently a practical manual intended to convey to students in a clear and forcible manner a sufficiently complete outline of gynæcology. In a word, we should say that any one who intended to make a special study of gynæcology could hardly do better than to begin with a minute perusal of this book, and that any one who intended to keep gynæcology subordinate to general practice, should hardly fail to have it on hand for future reference.—*N. Y. Med. Journal*, Jan. 1875.

A standard and almost classical work on the subject by an eminent American obstetrician. It well deserves its popularity.—*British Medical Journal*, Oct. 21, 1874.

BARNES ON DISEASES OF WOMEN—New Edition—Just Issued.

A CLINICAL EXPOSITION OF THE MEDICAL AND SURGICAL DISEASES OF WOMEN. By ROBERT BARNES, M.D., F.R.C.P., Obstetric Physician to St. Thomas's Hospital, etc. Second American, from the second and revised English edition. In one handsome volume of 784 pages, with 180 illustrations; cloth, $4 50; leather, $5 50.

The first edition of this work was extremely satisfactory, and showed small room for improvement; but with the careful revision and additions of the experienced writer, and the increased number of illustrations, the second edition is even better than the first, and we gladly admit for it a degree of perfection inferior to none attained by any work in the special department of which it treats. The book is rich in thought and clinical experience, and the opinions of other high authorities are so interestingly interwoven that it is by far the most readable work on the subject with which we are familiar. We commend it most heartily, not only to the specialist, but the general practitioner, assured that it will prove one of the most instructive and interesting in his library.—*Boston Med. and Surg. Journ.*, Apr. 3, '79.

Nowhere is it apparent that anything of value or interest has been omitted from this edition. The book is a rich mine of information, both practical and historical, and should be in the hands of every physician interested in gynæcology.—*Am. Journ. of Obstetrics*, April, 1879.

Dr. Barnes's work is one of a practical character, largely illustrated from cases in his own experience, but by no means confined to such, as will be learned from the fact that he quotes from no less than 628 medical authors in numerous countries. Coming from such an author, it is not necessary to say that the work is a valuable one and should be largely consulted by the profession.—*Am. Supp. Obstetrical Journ. Gt. Britain and Ireland*, Oct. 1878.

We pity the doctor who, having any considerable practice in diseases of women, has no copy of "Barnes" for daily consultation and instruction. It is at once a book of great learning, research, and individual experience and at the same time eminently practical. That it has been appreciated by the profession, both in Great Britain and in this country, is shown by the second edition following so soon upon the first.—*Am. Practitioner*, Nov. 1878.

DALTON'S PHYSIOLOGY—Lately Issued.

A TREATISE ON HUMAN PHYSIOLOGY.

DESIGNED FOR THE USE OF STUDENTS AND PRACTITIONERS OF MEDICINE.

By J. C. DALTON, M.D.,

Professor of Physiology in the College of Physicians and Surgeons in New York, etc.

Sixth Edition, Thoroughly Revised and Enlarged.

In one very handsome octavo volume of 830 *pages, with* 316 *illustrations; cloth*, $5 50; *leather*, $6 50.

Prof. Dalton has discussed conflicting theories and conclusions regarding physiological questions with a fairness, a fulness, and a conciseness which lend freshness and vigor to the entire book. But his discussions have been so guarded by a refusal of admission to those speculative and theoretical explanations, which at best exist in the minds of observers themselves as only probabilities, that none of his readers need be led into grave errors while making them a study.—*The Medical Record*, Feb. 19, 1876.

The style is clear, the arrangement admirable, and the figures excellent. Though much increased in bulk, it is still a moderate-sized volume. Every chapter bears evidence of a careful revision, and all the most important and trustworthy facts of recent physiological science have been incorporated.—*Canada Med. and Surg. Journ.*, Jan. 1876.

The revision of this great work has brought it forward with the physiological advances of the day, and renders it, as it has ever been, the finest work for students extant.—*Nashville Journ. of Med. and Surg.*, Jan. 1876.

Every one concedes that this is the best physiological text-book published in America.—*Virginia Med. Monthly*, Jan. 1876.

A work so popular, because so well known, needs no extended comments upon its acknowledged merits. It has stood some years before the scientific practitioners of this and other countries, a trul original American text-book of Physiology, contril uting to this science the original researches a individual opinions of an authority. This treati on physiology should be, as we think it is, the tex book of every student who is in search of ascertai truths, carefully winnowed from the chaff of unpr fitable discussions.—*Charleston Med. Journ. a Review*, Jan. 1876.

During the past few years several new works o physiology, and new editions of old works, ha appeared, competing for the favor of the medic student, but none will rival this new edition of Da ton As now enlarged, it will be found also to b in general, a satisfactory work of reference for t practitioner.—*Chicago Med. Jour. and Examine* Jan. 1876.

The work is fully abreast of the most recent adva ces and discoveries in physiological science, esp cially those appertaining to physiological chemist and the nervous system. We commend this admi ble work to our readers with the fullest confiden that it will give entire satisfaction to those w will give it an attentive perusal.—*Canada Lan* Feb. 1876.

Still holds its position as a masterpiece of lu writing, and is, we believe, on the whole, the be book to place in the hands of the student.—*Lond Students' Journal.*

CARPENTER'S PHYSIOLOGY—New Edition—Just Issued.

THE PRINCIPLES OF HUMAN PHYSIOLOGY. By WILLIAM B. CARPENTER, M.D., F.R.S F.G.S., F.L.S., Registrar to the Univ. of London, etc. Edited by HENRY POWER, M. Lond., Examiner in Natural Sciences, Univ. of Oxford. A new American, from the Eight Revised and Enlarged English Edition, with Notes and Additions, by FRANCIS G. SMIT M.D., Professor of Institutes of Medicine in the Univ. of Penna., etc. In one very larg and handsome octavo volume of 1083 pages, with two plates and 373 engravings on wood cloth, $5 50; leather, $6 50.

We have been agreeably surprised to find the volume so complete in regard to the structure and functions of the nervous system in all its relations, a subject that, in many respects, is one of the most difficult of all, in the whole range of physiology, upon which to produce a full and satisfactory treatise of the class to which the one before us belongs. The additions by the American editor give to the work as it is a considerable value beyond that of the last English edition. In conclusion, we can give our cordial recommendation to the work as it now appears. The editors have, with their additions to the only work on physiology in our language that in the fullest sense of the word is the production of a philosopher as well as a physiologist, brought it up as fully as could be expected, if not desired, to the standard of our knowledge of its subject at the present day. It will deservedly maintain the place it has always had in the favor of the medical profession.—*Journal of Nervous and Mental Disease*, April, 1877.

Thus fully are treated the structure of functions of all the important organs of the body, while there are chapters on sleep and somnambulism; chapters on ethnology; a full section on generation, and abundant references to the curiosities of physiology, as the evolution of light, heat, electricity, etc. In short, this new edition of Carpenter is, as we have said at the start, a very encyclopædia of modern physiology.—*The Clinic*, Feb. 24, 1877.

The work is simply complete, so far as any work on a rapidly progressing science can be. It is an exhaustive treatise, which every student and practitioner should possess.—*Ohio Med. Recorder*, Nov. 1877.

This work has such a world-wide reputation—it is the text-book in so many institutions—that it is necessary only to announce that another edition is ready. T work of the editors—English and American—has be thoroughly performed, so that the work "now acc rately represents the existing state of physiologi knowledge."—*Va. Med. Monthly*, Jan. 1877.

The merits of "Carpenter's Physiology" are widely known and appreciated that we need on allude briefly to the fact that in the latest editi will be found a comprehensive embodiment of t results of recent physiological investigation. Ca has been taken to preserve the practical charact of the original work. In fact, the entire work h been brought up to date, and bears evidence of t amount of labor that has been bestowed upon it b its distinguished editor, Mr. Henry Power. The Ame ican editor has made the latest additions, in ord fully to cover the time that has elapsed since the la English edition.—*N. Y. Med. Journ.*, Jan. 1877.

Under the able editorship of Dr. Power it mu still be regarded, treating it as a whole, as the mo complete exposition of physiological knowledge the English language. The present edition, co pared with the seventh edition, represents the a vancement of physiology during the past five year In its preparation the editor has collated most car fully most of the recent contributions of physiol gists, and he has got special and direct assistan from several. As a work of reference it ought have its place in the library of every medical ma There he will find a short and clear account of th most recent investigations, and no opportunity missed of pointing out any practical influence th work may have on our theories of disease.—*Edi burgh Medical Journal*, June, 1876

STILLÉ'S THERAPEUTICS—New Edition—Lately Issued.

THERAPEUTICS AND MATERIA MEDICA:

A SYSTEMATIC TREATISE ON THE ACTION AND USES OF MEDICINAL AGENTS, INCLUDING THEIR DESCRIPTION AND HISTORY.

By ALFRED STILLÉ, M.D.,

Prof. of the Theory and Practice, and of Clinical Medicine, in the Univ. of Pennsylvania, etc.

Fourth Edition, Revised and Enlarged.

In two large and handsome octavo volumes of nearly **2000** *pages: cloth*, **$10**; *leather*, **$12.**

It is unnecessary to do much more than to announce the appearance of the fourth edition of this well known and excellent work.—*Brit. and For. Med.-Chir. Review*, Oct. 1875.

We can hardly admit that it has a rival in the multitude of its citations and the fulness of its research into clinical histories, and we must assign it a place in the physician's library; not, indeed, as fully representing the present state of knowledge in pharmacodynamics, but as by far the most complete treatise upon the clinical and practical side of the question.—*Bost. Med. and Surg. Journ.*, Nov. 5, 1874.

The magnificent work of Professor Stillé is known wherever the English language is read, and the art of medicine cultivated: known so well that no encomiums of ours could brighten its fame, and no unfavorable criticism could tarnish its reputation.—*Philada. Med. Times*, Dec. 12, 1874.

The prominent feature of Dr. Stillé's great work is sound good sense. It is learned, but its learning is of inferior value compared with the discriminating judgment which is shown by its author in the discussion of his subjects, and which renders it a trustworthy guide in the sick-room.—*Am. Practitioner*, Jan. 1875.

For all who desire a complete work on therapeutics and materia medica for reference in cases involving medico-legal questions as well as for information concerning remedial agents, Dr. Stillé's is "*par excellence*" the work. The work being out of print, by the exhaustion of former editions, the author has laid the profession under renewed obligations, by the careful revision, important additions, and timely reissuing a work not exactly supplemented by any other in the English language, if in any language. The mechanical execution handsomely sustains the well-known skill and good taste of the publisher.—*St. Louis Med. and Surg. Journal*, Dec. 1874.

Many good books on materia medica have been written, few great ones; in this country we can recall but one, that of Stillé. Originally written in 1860, its later edition even outrivals the earlier ones in popularity. The secret of Stillé's success has been this: its author had no personal ends to subserve; he dealt solely in facts, ignoring altogether the fiction of theory. Founded on the information deduced from rational empiricism, this work has stood the attrition of time, and bids fair to be the standard American text-book for years to come. It is a master-piece; a monument to the memory of its erudite and illustrious author.—*Cincinnati Lancet and Observer*, Sept. 1876.

The rapid exhaustion of three editions and the universal favor with which the work has been received by the medical profession, are sufficient proof of its excellence as a repertory of practical and useful information for the physician. The edition before us fully sustains this verdict, as the work has been carefully revised and in some portions rewritten, bringing it up to the present time by the admission of chloral and croton-chloral, nitrite of amyl, bichloride of methylene, methylic ether, lithium compounds, gelseminum, and other remedies.—*Am. Journ. of Pharmacy*, Feb. 1875.

FOTHERGILL'S THERAPEUTICS—Lately Issued.

THE PRACTITIONER'S HANDBOOK;

OR, THE PRINCIPLES OF THERAPEUTICS.

By J. MILNER FOTHERGILL, M.D. Edin., M.R.C.P. Lond.,

Assistant Physician to the West London Hospital. Assistant Physician to the City of London Hospital for Diseases of the Chest, Victoria Park.

In one very neat octavo volume of 576 *pages; cloth*, **$4 00.**

We heartily commend this book to the medical student as an honest and intelligent guide through the mazes of therapeutics, and assure the practitioner who has grown gray in the harness that he will derive pleasure and instruction from its perusal. The imperfections and errors which we have noticed are few and unimportant. On the other hand, the excellences are many and patent. Valuable suggestions and material for thought abound throughout.—*Bost. Med. and Surg. Journ.*, March 8, 1877.

Our friends will find this a very readable book; and that it sheds light upon every theme it touches, causing the practitioner to feel more certain of his diagnosis in difficult cases. We confidently commend the work to our readers as one worthy of careful perusal. It lights the way over obscure and difficult passes in medical practice. The chapter on the circulation of the blood is the most exhaustive and instructive to be found. It is a book every practitioner needs, and would have, if he knew how suggestive and helpful it would be to him.—*St. Louis Med. and Surg. Journal*, April, 1877.

None can read it without being impressed with the immense amount of common sense which is possessed by the author, as well as natural tact in interpreting the indications of treatment. His style is clear and agreeable, and he has the faculty of expounding the fundamental principles of medicine in such a way as to give them a practical application to treatment. It is, in fact, one of the most interesting, entertaining, and instructive works of its kind that we have ever read.—*N. Y. Med. Record*, March 17, 1877.

He has labored with a different object, and has succeeded in producing a volume that will be found an exceedingly useful companion to the standard works on practice. It abounds in information of value at the bedside, and is eminently practical throughout.—*N. Y. Med. Journal*, April, 1877.

This is an excellent book, one long needed. Its practical teachings make it useful to the busy physician; and the college student will derive from it great assistance in his systematic studies of the intricate subject of therapeutics. The object of the author is "to explain the *rationale* of our therapeutic measures." No work with which we are acquainted succeeds so admirably.—*Va. Med. Monthly*, March, 1877.

WATSON'S PRACTICE—Lately Issued.

LECTURES ON THE PRINCIPLES AND PRACTICE OF PHYSIC. Delivered at King's College, London. By Sir Thomas Watson, M.D., Physician-in-Ordinary to the Queen, etc. A new American, from the fifth revised and enlarged English edition. Edited, with additions, and numerous wood-cuts, by Henry Hartshorne, M.D., Professor of Hygiene in the University of Pennsylvania. In two large and handsome 8vo. volumes of about 900 pages each; cloth, $9 00; leather, $11 00.

HARTSHORNE'S ESSENTIALS—New Edition—Lately Issued.

ESSENTIALS OF THE PRINCIPLES AND PRACTICE OF MEDICINE. A Handbook fo students and practitioners. By Henry Hartshorne, M.D., Professor of Hygiene in th University of Pennsylvania, etc. Fourth edition, thoroughly revised. In one handsom royal 12mo. volume of 548 pages, with 100 illustrations; cloth, $2 63; leather, $2 88.

Another edition of one of the best works of its kind, enlarged by many new observations rendered necessary by the progress of medical science, and for the first time, furnished with numerous illustrations.—*London Lancet*, Jan. 1875.

Of all the compendiums that we have seen, we consider this the best, and the student or practitioner who finds himself compelled to keep his mind fresh on many subjects at once, will meet with an invaluable aid in this little book.—*Peninsular Journal of Med.*, Nov 1874.

Without doubt, the best book of the kind published in the English language.—*St. Louis Med. and Surg. Journal*, Nov. 1874.

We may state here, once for all, that both the works under review are good examples of what a systematic text-book of clinical medicine, suitable for the use of students, in particular, ought to be. Dr. Hartshorne's work has already been reviewed in our pages, and it is necessary now only to endorse the favorable opinions we then entertained as to its intrinsic merits. The value of the book is enhanced by nearly three hundred formulæ and by two copious indexes, one of diseases and the suitable formulæ, the other a general index. The important subject of Disinfection is disposed of i one page, which we take the liberty of reproduci as a specimen of the sterling worth of the volume.—*Dublin Journal of Med. Sci.*, Jan. 1875

The work is brought fully up with all the rece advances in medicine, is admirably condensed, a yet sufficiently explicit for all the purposes inten ed, thus making it by far the best work of its cha acter ever published.—*Cincinnati Clinic*, Oct. 1 1874.

As a brief, condensed, but comprehensive han book, it cannot be improved upon.—*Chicago Med cal Examiner*, Nov. 15, 1874.

We can say with the strictest truth that it is t best work of the kind with which we are acquainte It embodies in a condensed form all recent contrib tions to practical medicine, and is therefore usef to every busy practitioner throughout our countr besides being admirably adapted to the use of st dents of medicine. The book is faithfully and ab executed.—*Charleston Med. Journal*, April, 187

As a handbook, which clearly sets forth the I SENTIALS of the PRINCIPLES AND PRACTICE OF MEDICI we do not know of its equal.—*Va. Med. Monthl* Nov. 1874.

By the same Author—Lately Issued.

A CONSPECTUS OF THE MEDICAL SCIENCES; containing Handbooks on Anatomy, Phy ology, Chemistry, Materia Medica, Practical Medicine, Surgery, and Obstetrics. Seco edition, thoroughly revised and improved. In one large royal 12mo. volume of more th 1000 closely printed pages, with 477 illustrations on wood. Cloth, $4 25; leather, $5.

This manual is excellent of its kind, and has long been favorably known to students as a condensed and yet complete review of all the subjects pursued in the usual medical course.—*N. Y. Med. Journal*, Sept. 1874.

This work admirably answers the purpose for which it was designed, viz., to serve as a book of hasty reference, and an easy source of information for the busy practitioner, whose extensive practice will rarely allow him sufficient leisure to study exhaustive treatises, or waste time in searching through voluminous text-books for the special subject sought for.—*Am. Journ. of Obstetrics*, Aug. 1874.

The work is intended as an aid to the medical student, and as such appears to admirably fulfil its object by its excellent arrangement, the full compilation of facts, the perspicuity and terseness of language, and the clear and instructive illustrations in some parts of the work.—*Amer. Journ. of Pharm.*, July, 1874.

Hartshorne's Conspectus is the best work of the kind with which we are acquainted; and we have no doubt but that college students will find it of the greatest aid to them. The present edition has be adapted to the present state of medical science a teaching. Considerable change has been made the Manual of Chemistry. Both the old and ne equivalents have been given and formulas of i portant substances and reactions In the Manu of Materia Medica fourteen new articles have be added, and the nomenclature has been made conform to the last edition of the U. S. Pharma pœia. The other Manuals have been more or le revised and had added more or less new matter. *Cincinnati Med. News*, Aug. 1874.

The work before us has already successfully a serted its claim to the confidence and favor of t profession; it but remains for us to say that in t present edition the whole work has been fairly ov hauled and brought up to the present status of t science.—*Atlanta Medical and Surgical Journ* Sept. 1874.

The student will find this the most convenient a useful book of the kind on which he can lay l hand.—*Pacific Medical and Surgical Journal*, Au 1874.

By the Same Author.

HANDBOOK OF ANATOMY AND PHYSIOLOGY. Second edition, revised. In one roy 12mo. volume of 211 pages, with 125 illustrations. Cloth, $1 75.

NEILL & SMITH'S COMPENDIUM—Lately Issued.

AN ANALYTICAL COMPENDIUM OF THE VARIOUS BRANCHES OF MEDICAL SC ENCE; for the Use and Examination of Students. By John Neill, M.D., and Franc G. Smith, M.D., late Professor of the Institutes of Med. in the Univ. of Penna. A ne edition, revised and improved. In one large and very handsomely printed royal 12m volume of about 1000 pages, with 374 illustrations. Cloth, $4; leather, $4 75.

LUDLOW'S MANUAL OF EXAMINATIONS.

A MANUAL OF EXAMINATIONS upon Anatomy, Physiology, Surgery, Practice of Med cine, Obstetrics, Materia Medica, Chemistry, Pharmacy, and Therapeutics. To which added a Medical Formulary. By J. L. Ludlow, M.D Third edition, thoroughly r vised and greatly extended and enlarged. In one handsome royal 12mo. volume of 8 pages, with 370 illustrations. Cloth, $3 25: leather, $3 75.

PARRISH'S PHARMACY—New Edition—Lately Issued.

A TREATISE ON PHARMACY. Designed as a Text-book for the Student, and as a Guide for the Physician and Pharmacist. By Edward Parrish, late Professor of Materia Medica in the Philadelphia College of Pharmacy. Fourth edition, thoroughly revised and enlarged, by Thomas S. Wiegand. In one handsome octavo volume of 977 pages, with 280 illustrations; cloth, $5 50; leather, $6 50.

We are glad to find that this great work of Professor Parrish has reached a fourth edition. The author died whilst this edition was being prepared, and after his death it was completed by T. S. Wiegand, of Philadelphia. The merits of this work are too well known to require commendation from us, and it will long remain a standard work on Pharmacy. It is specially meant to illustrate the United States Pharmacopœia, but will also be found to be a most valuable work of reference to all in this country who are interested in Pharmacy. The work is worthy alike of its author and of the subject of which it treats—a subject far too little studied by many members of the medical profession —*Edinburgh Med. Journal*, March, 1876.

We have here an encyclopedia of pharmacy, of equal value as a text-book for the student and as a guide for the pharmacist and physician, which has reached its fourth edition. A work which has gained such a hold upon the confidence of the profession stands in no need of the recommendation of the press. We have called the treatise an encyclopedia as the name most descriptive of its character—a work in which may be found all that the pharmacist or student of medicine need to know of pharmacy. On whatever point of pharmacy he may be seeking information, he will be fully instructed in this handbook, which is heartily recommended as fully up to the times. And we take pleasure in adding that its mechanical execution is equal to the high scientific merits of the work —*Amer. Practitioner*, July, '74.

Perhaps one, if not the most, important book upon pharmacy, which has appeared in the English language, has emanated from the transatlantic press "Parrish's Pharmacy" is a well-known work on this side of the water, and the fact shows us that a really useful work never becomes merely local in its fame. Thanks to the judicious editing of Mr. Wiegand, the posthumous edition of "Parrish" has been saved to the public with all the mature experience of its author and perhaps none the worse for a dash of new blood.—*London Pharm. Journ.*, Oct. 17, 1874.

Of Dr. Parrish's great work on pharmacy it only remains to be said that the editor has accomplished his work so well as to maintain. in its fourth edition, the high standard of excellence which it had attained in previous editions, under the editorship of its accomplished author. This has not been accomplished without much labor, and many additions and improvements, involving changes in the arrangement of the several parts of the work, and the addition of much new matter. With the modifications thus effected, it constitutes, as now presented, a compendium of the science and art indispensable to the pharmacist, and of the utmost value to every practitioner of medicine desirous of familiarizing himself with the pharmaceutical preparation of the articles which he prescribes for his patients. —*Chicago Med. Journ.*, July, 1874.

The work is eminently practical, and has the rare merit of being readable and interesting, while it preserves a strictly scientific character. The whole work reflects the greatest credit on author, editor, and publisher. It will convey some idea of the liberality which has been bestowed upon its production when we mention that there are no less than 280 carefully executed illustrations. In conclusion, we heartily recommend the work, not only to pharmacists, but also to the multitude of medical practitioners who are obliged to compound their own medicines. It will ever hold an honored place on our own bookshelves.—*Dublin Med. Press and Circular*, Aug. 12, 1874.

Parrish's Pharmacy has been long known wherever the English language is spoken, as pre-eminently the *vade mecum* of the pharmaceutical student; it is needless for us, therefore, in noticing the present revised edition, to recapitulate the general scope and aims of the work. It has been the aim of the editor to "preserve strictly the practical and useful character of the work," and this aim he has manifestly held steadily in view in the selection of new matter, yet the additions to the present volume amount to nearly one hundred and fifty pages. Typographically, the volume makes an unusually fine appearance. The type is clear, the paper good, and the work of the proof-reader has been carefully done.—*Detroit Rev. of Med. and Pharm.*, June, 1874.

GRIFFITHS' FORMULARY—New Edition—Lately Issued.

A UNIVERSAL FORMULARY: Containing the Methods of Preparing and Administering Officinal and other Medicines. The whole adapted to Physicians and Pharmaceutists. By Robert E. Griffiths, M.D., etc. Third Edition, thoroughly Revised, with numerous additions, by John M. Maisch, Professor of Materia Medica in the Phila. College of Pharmacy. In one large and handsome octavo volume of about 800 pages: cloth, $4 50; leather, $5 50.

To the druggist a good formulary is simply indispensable, and perhaps no formulary has been more extensively used than the well-known work before us Many physicians have to officiate also as druggists. This is true especially of the country physician. and a work which shall teach him the means by which to administer or combine his remedies in the most efficacious and pleasant manner, will always hold its place upon his shelf. A formulary of this kind is of benefit also to the city physician in largest practice.—*Cincinnati Clinic*, Feb. 21, 1874.

A more complete formulary than it is in its present form the pharmacist or physician could hardly desire. To the first some such work is indispensable, and it is hardly less essential to the practitioner who compounds his own medicines. Much of what is contained in the introduction ought to be committed to memory by every student of medicine. As a help to physicians it will be found invaluable, and doubtless will make its way into libraries not already supplied with a standard work of the kind.—*The Am. Practitioner*, Louisville, July, 1874.

As a work of ready reference on all officinal as well as unofficinal preparations, this volume will be of great service. The manner of preparing and administering medicine is described in terse and easy language. The special features of all the more recent preparations introduced into the English and American Pharmacopœias are fully described. It is a work that must, of necessity, occupy a place in every well-informed physician's library.—*Am. Journ. of Syphilography*, October, 1874.

The general index, without which half the value of such a work is lost, appears essentially complete, and the whole work forms a most useful and reliable book of reference for the physician and pharmacist.—*Bost. Med. and Surg. Journ.*, March 19, 1874.

We regard this as the best work on the subject of which we have any knowledge.—*Cincinnati Lancet and Observer*, April, 1874.

The Formulary has already proved itself acceptable to the medical profession, and we do not hesitate to say that the third edition is much improved. and of greater practical value, in consequence of the careful revision of Prof. Maisch.—*Chicago Med. Examiner*, March 15, '74.

We take pleasure in commending to our professional brethren this new edition of a standard work, whose general excellence calls for no new testimonial from us at this late day. Without changing materially the arrangement and general plan of previous editions, Prof. Maisch has made in this the numerous alterations and additions which progress in the pharmacal art demands. This volume ought to be in the hands of every physician and pharmacist in the land.—*Detroit Rev. of Med. and Pharm.*, April, 1874.

HAMILTON ON NERVOUS DISEASES.—Now Ready.

NERVOUS DISEASES; THEIR DESCRIPTION AND TREATMEN

By ALLAN McLANE HAMILTON, M.D.,

Attending Physician to the Hospital for Epileptics and Paralytics, Blackwell's Island, N. Y., and at the Out-Patients' Department of the New York Hospital.

In one handsome octavo volume of 512 *pages, with* 53 *illustrations; cloth*, $3 50.

This is unquestionably the best and most complete text-book of nervous diseases that has yet appeared, and were international jealousy in scientific affairs at all possible, we might be excused for a feeling of chagrin that it should be of American parentage. This work, however, has been performed in New York, and has been so well performed that no room is left for anything but commendation. With great skill, Dr. Hamilton has presented to his readers a succinct and lucid survey of all that is known of the pathology of the nervous system, viewed in the light of the most recent researches. From the preliminary description of the methods of examination and study, and of the instruments of precision employed in the investigation of nervous diseases, up till the final collection of formulæ, the book is eminently practical.—*Brain*, London, Oct. 1878.

The author tells us in his preface that it has been his object to produce a concise, practical book, and we think he has been successful, considering the extent of the subject which he has undertaken. In fact, it is more extensive than the title properly or accurately indicates, embracing—besides what are usually regarded as nervous diseases—inflammatory affections, both acute and chronic, hemorrhages and tumors of the cerebrum and cerebellum, medulla oblongata, spinal cord and nerves, with thrombosis and embolism of the arteries, sinuses, and veins. The reader may therefore expect information, more or less full and satisfactory, on almost every point connected with the nervous system. We have no hesitation in saying that reliance may be placed on Dr. Hamilton's conscientious performance of his self-assigned task, on his soundness of judgment, and freedom from empiricism.—*Edinburgh Med. Journ.*, Oct. 1878.

The author tells us that it has been his aim "to produce a concise, practical book," and in this he has met with a very flattering success. His work, while giving thoughtful attention to matters of diagnosis and treatment, at the same time does not fail to take a comprehensive view of the etiology and pathology of nervous affections This work is a valuable one, especially as it does not mislead the reader by giving results attained or attainable by no one b the author.—*Buffalo Med. and Surg. Journ.*, No 1878.

From a very careful examination of the who work, we can justly say that the author has not on clearly and fully treated of diagnosis and treatmen but, unlike most works of this class, it is very co prehensive in regard to etiology, and exposes t pathology of nervous diseases in the light of the ve latest experiments and discoveries. The drawin are excellent and well selected. After this caref revision, we can heartily recommend this work students and general practitioners in particular being a full exposition of diseases of the nervo system, their pathology and treatment, to date.— *Y. Med. Record*, Aug. 3, 1878.

A need has existed for a book on nervous disea clear, compact, comprehensive, and up to the tim This has been largely met by Dr. Hamilton's volum The author, an able and industrious worker and w ter, has already become well known to the professio After a careful reading of this book, we can comme it to the general practitioner and student as the wo most likely to meet their requirements. The speciali also will find much in it to interest and instruct. it is not wanting in original investigation, clinic climatical, histological, and pathological.—*Phil Med. Times*, Sept. 28, 1878.

The different nervous diseases are taken up sy tematically and fully treated. The volume throug out is written in clear and practical language, a contains in brief the salient points of clinical histor diagnosis, pathology, and treatment of nervous d eases recognized at the present day The work h been prepared with a view of meeting the wante the student and general practitioner. Whenever n cessary, handsome illustrations are added to expla the text. It is a volume which will supply a ne long felt by the profession, and to Dr. Hamilton t profession is indebted for this clear and able class cation of nervous diseases and a publication of u common merit.—*Maryland Medical Journal*, Au 1878.

GREEN'S PATHOLOGY—New Edition—Now Ready.

AN INTRODUCTION TO PATHOLOGY AND MORBID ANATOMY. By T. HENRY GRE M.D. Lond., Fellow of the Royal College of Physicians, Physician to Charing Cross Ho pital, Lecturer on Pathology and Morbid Anatomy at Charing Cross Hospital, etc. Thi American, from the fourth enlarged and revised English edition. In one very handso octavo volume of 332 pages, with 132 illustrations; cloth, $2 25.

We are glad to welcome a new edition of this excellent manual of pathology. The work of revision has been carefully and thoroughly done. No student can afford or ought to be allowed to graduate without at least reading some work which embodies the essential doctrines of pathology; and we know of no work which so fully meets the wants of the student and young practitioner.—*Chicago Med. and Surg. Journal*, Sept. 1879.

The fourth revised edition is before us, and in it the general high character of the work is mai tained It contains much new matter, the object the author being to make it a more complete gui for the student The arrangement and choice subjects has made the book very satisfactory, a for the student of morbid anatomy, or the gener practitioner who cannot spare the time to stu extended treatise, the concise statements which contains, will be found very serviceable.—*N. Med. Record*, Aug. 2, 1879.

SCHAFER'S HISTOLOGY—Just Issued.

A COURSE OF PRACTICAL HISTOLOGY. Being an Introduction to the Use of the Micr scope. By EDWARD ALBERT SCHAFER, M.D., Asst Professor of Physiology in Universi College, London. In one handsome royal 12mo. volume of 304 pages, with numerous illu trations; cloth, $2.

CULLERIER'S ATLAS OF VENEREAL DISEASES.

AN ATLAS OF VENEREAL DISEASES. By A. CULLERIER, Surgeon to the Hôpital du Mid Translated and Edited by FREEMAN J. BUMSTEAD, M.D., late Prof. of Venereal Diseas in the College of Physicians and Surgeons, New York. In one large imperial 4to. volume 328 double columned pages, with 26 plates, containing about 150 figures, beautifully colore many of them the size of life, strongly bound in cloth, price $17; also, in five parts, stou wrappers, at $3 per part.

SUPERSTITION AND FORCE—Third Edition—Just Ready.

SUPERSTITION AND FORCE:

ESSAYS ON THE WAGER OF LAW, THE WAGER OF BATTLE, ORDEAL AND TORTURE.

BY HENRY C. LEA.

Third revised and enlarged edition. In one handsome royal 12mo. vol. of 522 pages; cloth, $2 50.

"Mr. H. C. Lea has chosen an unfortunate title for a really valuable book. Superstition and Force is a name that suggests the idea rather of theological controversy than of antiquarian study; and it is not under such a heading that the reader would look for an elaborate account of some of the most important forms of the ordeal, and of the various phases which the principle of an appeal to Divine interposition for the decision of human quarrels assumed in the development of mediæval jurisprudence. The work is much more thorough and candid than the majority of American researches into the recesses of the history of the so-called dark ages wherein lie the roots of most modern institutions, and wherein may be found the explanation of many curious survivals recently, or even now, embedded in modern law"—*The Saturday Review*, January 25, 1879.

The appearance of a new edition of Mr. Henry C. Lea's "Superstition and Force" is a sign that our highest scholarship is not without honor in its native country. Mr. Lea has met every fresh demand for his work with a careful revision of it, and the present edition is not only fuller and, if possible, more accurate than either of the preceding, but, from the thorough elaboration, is more like a harmonious concept and less like a batch of studies.—*The Nation*, Aug 1, 1878.

It is one of the most attractive works we have ever read, combining progressive history and the curiosities of history, philosophy, and the elements of romance in a most skilful and logical manner. It also combines the results of careful and scholarly research with those of original and enlightened observation and thought. It will furnish gratification and instruction to all classes of readers.—*Kansas City Rev. of Science and Industry*, Sept. 1878.

Many will be tempted to say that this, like the "Decline and Fall," is one of the uncriticizable books. Its facts are innumerable, its deductions simple and inevitable, and its *chevaux-de-frise* of reference bristling and dense enough to make the keenest, stoutest, and best equipped assailant think twice before advancing. Nor is there anything controversial in it to provoke an assault. The author is no polemic. Though he obviously feels and thinks strongly, he succeeds in attaining impartiality. Whether looked on as a picture or a mirror, a work such as this has a lasting value.—*Lippincott's Magazine*, Oct. 1878.

The work is a master-piece and unique of its kind. Its judicial impartiality and freedom from political, religious, and philosophical sectarianism makes it a work that all thoughtful men may study with advantage, and it is also a mine of facts, any one of which may easily be reached by a reference to the very copious index.—*Philadelphia Evening Bulletin*, July 30, 1878.

Of the curious learning and the profound philosophy which Mr. Lea brings to the almost exhaustive exposition of these themes anything but a simple recognition would be on our part impertinent. We have already noted the richness of his resources and his ability and fidelity in the use of them.—*Boston Evening Transcript*, Aug. 28, 1878.

By the same Author—Lately Published.

STUDIES IN CHURCH HISTORY—THE RISE OF THE TEMPORAL POWER—BENEFIT OF CLERGY—EXCOMMUNICATION. In one large royal 12mo. volume of 516 pages; cloth, $2 75.

Mr. Lea's latest work, "Studies in Church History," fully sustains the promise of the first. It deals with three subjects—the Temporal Power, Benefit of Clergy, and Excommunication, the record of which has a peculiar importance for the English student, and is a chapter on Ancient Law likely to be regarded as final. We can hardly pass from our mention of such works as these—with which that on "Sacerdotal Celibacy" should be included—without noting the literary phenomenon that the head of one of the first American houses is also the writer of some of its most original books.—*London Athenæum*, Jan. 7, 1871.

His books, therefore, have it for the prime element of their value that they contain authentic history, drawn directly from its sources. The author has, indeed, his historical theories; he marks with care the development of ideas and tendencies, and traces with delicate skill the filaments that bind seemingly isolated events and give unity to the collective movement of a race or an age; yet he never generalizes till he has all the facts within his grasp—his conclusions never furnish him his premises, he never picks over his materials to select only such as will sustain his theories. In fine these essays are models in their kind—the simple, orderly presentation of facts, events, and movements in their bearing on their respective subjects—each a complete and exhaustive monograph, containing, with ample means of verification in references and extracts, all that the reader needs to place himself at the point of view which the author has attained by the most painstaking and elaborate research.—*North American Review*, July, 1870.

Mr. Lea has done great honor to himself and this country by the admirable works he has written on ecclesiological and cognate subjects. We have already had occasion to commend his "Superstition and Force" and his "History of Sacerdotal Celibacy." The present volume is fully as admirable in its method of dealing with topics and in the thoroughness—a quality so frequently lacking in American authors—with which they are investigated.—*New York Journal of Psychol. Medicine*, July, 1870.

By the same Author—Lately Published.

AN HISTORICAL SKETCH OF SACERDOTAL CELIBACY IN THE CHRISTIAN CHURCH. In one handsome octavo volume of 600 pages; extra cloth, $3 75.

In freshness and exactness of detail, in conscientious citation of authorities, in the impartiality with which all possible sources of information have been searched, in learning and scholarly finish, it is absolutely unapproached by any similar treatise which has issued from the American press. Indeed, the number of foreign historical works which have equalled it in these particulars might be readily counted on the fingers.—*Quarterly Journal of Psychological Medicine*, October, 1867.

Thus his chapter on the Anglican church is perhaps the most accurate and most satisfactory account of our own Reformation, as to the question of celibacy or marriage that could be found.—*Quarterly Review*, London, Oct 1867.

This exhaustive treatise of Mr. Lea upon ecclesiastical celibacy we take to possess, like his excellent work upon "Superstition and Force," all the capital requisites of an historical monograph, an immense body of information and of reference on the subject in hand, a sufficiently cool and dispassionate manner of presenting facts, and a strict adhesion to the central question. The amount of research, and, indeed, of scholarship involved in the preparation of such a volume, is such as to command the warmest recognition.—*Atlantic Monthly*, Sept. 1867.

TAYLOR'S MEDICAL JURISPRUDENCE—Lately Issued.

MEDICAL JURISPRUDENCE.

BY ALFRED S. TAYLOR, M.D.,

Lecturer on Medical Jurisprudence in Guy's Hospital.

SEVENTH AMERICAN EDITION.

EDITED BY JOHN J. REESE, M.D.,

Prof. of Medical Jurisprudence in the University of Pennsylvania.

In one large octavo volume of nearly 900 pages. Cloth, $5 00; *leather*, $6 00.

To the members of the legal and medical profession, it is unnecessary to say anything commendatory of Taylor's Medical Jurisprudence. We might as well undertake to speak of the merit of Chitty's Pleadings.—*Chicago Legal News*, Oct. 16, 1873.

It is beyond question the most attractive as well as most reliable manual of medical jurisprudence published in the English language.—*Am. Journ. of Syphilography*, Oct 1873.

It is altogether superfluous for us to offer anything in behalf of a work on medical jurisprudence by an author who is almost universally esteemed to be the best authority on this specialty in our language. On this point, however, we will say that we consider Dr. Taylor to be the safest medico-legal authority to follow, in general, with which we are acquainted in any language.— *Va. Clinical Record*, Nov. 1873.

This last edition of the Manual is probably the best of all, as it contains more material and is worked up to the latest views of the author, as expressed in the last edition of the Principles. Dr. Reese, the editor of the Manual, has done everything to make his work acceptable to his medical countrymen.—*N. Y. Med. Record*, Jan. 15, 1874.

As now presented to the public, it has claims to regard over all the former editions, in having been much extended, and so brought fully up to the present time, by its American editor. From its first appearance it has taken the highest rank among the authorities on medical jurisprudence; nor is it likely to be superseded by any other treatise on the subject, so long as it continues to be revised with the care which its author has bestowed upon its successive editions.—*Am. Practitioner*, Nov. 1873.

This new edition of Dr. Taylor's well-known work on medical jurisprudence is one of the most complete and reliable treatises on the subject in our language. In this work of Dr. Taylor's can be found not only the facts and laws pertaining to medical jurisprudence, but also all necessary rules for the guidance of medical practitioners in the investigation of cases and the giving of testimony.—*Med. Examiner*, Chicago, Feb. 1, 1874.

By the same Author—Just Issued.

POISONS IN RELATION TO MEDICAL JURISPRUDENCE AND MEDICINE. Third American, from the third and revised English edition. In one large octavo volume of 850 pages; cloth, $5 50; leather, $6 50.

The present is based on the two previous editions; "but the complete revision rendered necessary by time has converted it into a new work." This statement from the preface contains all that it is desired to know in reference to the new edition. The works of this author are already in the library of every physician who is liable to be called upon for medico-legal testimony (and what one is not?) so that all that is required to be known about the present book is that the author has kept it abreast with the times. What makes it now, as always, especially valuable to the practitioner, is its conciseness and practical character, only those poisonous substances being described which give rise to legal investigations.—*The Clinic*, Nov. 6, 1875.

Dr. Taylor has brought to bear on the compilation of this volume, stores of learning, experience, and practical acquaintance with his subject, probably far beyond what any other living authority on toxicology could have amassed or utilized. He has fully sustained his reputation by the consummate skill and legal acumen he has displayed in the arrangement of the subject-matter, and the result is a work on Poisons which will be indispensable to every student or practitioner in law and medicine.—*The Dublin Journ. of Med. Sci.*, Oct. 1875.

By the same Author.

THE PRINCIPLES AND PRACTICE OF MEDICAL JURISPRUDENCE. Second Edition, revised, with numerous illustrations. In two large octavo volumes; cloth, $10; leather, $12.

Taylor's work is well worthy the reputation which it has acquired in this country and in England. It is a treatise without which no medical library can be considered at all complete; and, if it were more thoroughly studied by certain members of the medical profession, there would be far fewer of those disgraceful exhibitions on the witness stand which have rendered the term "medical witness" a reproach to our honorable profession.—*N. Y. Med. Journ.*, Mar. '74.

All we can say is, that it is abreast of the times, and fully sustains the enviable reputation of the first edition. All the important medical cases are worked up to date, necessitating the addition of much new material, and much modification of older material. As a whole, the work is unequalled, and fully sustains the reputation which it has earned of being the standard authority upon the subject.—*The Med. Record*, N. Y., Jan. 15, 1874.

BLANDFORD ON INSANITY—Lately Issued.

INSANITY AND ITS TREATMENT; Lectures on the Treatment, Medical and Legal, of Insane Patients. By G. FIELDING BLANDFORD, M.D., F.R.C.P., Lecturer on Psychological Medicine at the School of St. George's Hospital, etc. With a Summary of the Laws in force in the United States on the Confinement of the Insane. By ISAAC RAY, M.D. In one very handsome octavo volume of 471 pages; cloth, $3 25.

It satisfies a want which must have been sorely felt by the busy general practitioners of this country, it takes the form of a manual of clinical description of the various forms of insanity, with a description of the mode of examining persons suspected of insanity. We call particular attention to this feature of the book, as giving it a unique value to the general practitioner. If we pass from theoretical considerations to descriptions of the varieties of insanity as actually seen in practice and the appropriate treatment for them, we find in Dr. Blandford's work a considerable advance over previous writings on the subject. His pictures of the various forms of mental diseases are so clear and good that no reader can fail to be struck with their superiority to those given in ordinary manuals in the English language or (so far as our own reading extends) in any other.—*Lond. Practitioner*, Feb. 1871.

FINLAYSON'S CLINICAL DIAGNOSIS.—Just Issued.

CLINICAL MANUAL FOR THE STUDY OF MEDICAL CASES. For the use of Students and Practitioners of Medicine. By JAMES FINLAYSON, M.D., Phys. and Lecturer on Clin. Med. in the Glasgow Western Infir., etc. In one handsome 12mo. volume of about 550 pages, with 85 illustrations; cloth, $2 63.

This book is perhaps the most complete of any manual in our language dealing with the subject of bedside observation. It is the work of many hands; for five contributors have aided the editor in its production. This has ensured a thoroughness and comprehensiveness of the subject, which adds to the value of the book. . . . . . A book which should become very popular among students.—*London Lancet*, July 19, 1879.

This work has a freshness in its style and in the character of its contents which is very attractive. It is, moreover, a well made book as regards the attention which has been paid to details, too apt to be overlooked by writers who have not been in the constant habit of teaching them to students. It has likewise an excellent index, clear type, and good paper, and is likely to become one of the most popular text-books on the subject.—*New Remedies*, Feb. 1879.

We have read the various chapters with interest, and hesitate not to affirm that there are few practitioners, and no medical students, who would not greatly profited by their careful study Largely the scope of the work is unique, in that it occupies a medium position between those works that give the merest skeleton and those that are extremely elaborate. It is an admirable book in design and execution. Every student that is in attendance upon clinics or hospitals would act wisely in making it his constant companion until its contents are mastered —*Detroit Lancet*, June, 1879.

The aim of the author is to teach a student and practitioner how to examine a case so as to use "*all his knowledge*" in arriving at a diagnosis. All the various symptoms of the several systems are grouped together in such a manner as to make their relations to a final diagnosis clear and easy of apprehension. This work has been done by men of large experience and trained observation, who have been long recognized as authorities upon the subjects which they treat. There is a profusion of illustrations to illustrate subjects under discussion. The application of electricity, and instruments of precision in diagnosis, is fully discussed. The book is all good We commend it to all students and practitioners of medicine as a work worthy of a place in their libraries.—*Ohio Med. Recorder*, Dec. 1878.

HABERSHON ON THE ABDOMEN.—Just Issued.

ON THE DISEASES OF THE ABDOMEN; comprising those of the Stomach and other parts of the Alimentary Canal, Œsophagus, Cæcum, Intestines, and Peritoneum. Second American, from the third enlarged and revised English edition, with illustrations. In one handsome octavo volume of over 500 pages; cloth, $3 50.

It is not practicable, within the limits of a brief notice such as this, to call attention to all the excellencies of Dr. Habershon's work. Taken altogether, this is one of the most satisfactory books we have had in hand for a long time, adapted alike to the wants of the medical student and practitioner.—*St. Louis Courier of Medicine*, July, 1879.

This valuable treatise on diseases of the stomach and abdomen has been out of print for several years, and is therefore not so well known to the profession as it deserves to be. It will be found a cyclopædia of information, systematically arranged, on all diseases of the alimentary tract, from the mouth to the rectum. A fair proportion of each chapter is devoted to symptoms, pathology, and therapeutics. The present edition is fuller than former ones in many particulars, and has been thoroughly revised and amended by the author. Several new chapters have been added, bringing the work fully up to the times, and making it a volume of interest to the practitioner in every field of medicine and surgery. Perverted nutrition is in some form associated with all diseases we have to combat, and we need all the light that can be obtained on a subject so broad and general. Dr. Habershon's work is one that every practitioner should read and study for himself.—*N. Y. Med. Journ.*, April, 1879.

WELLS ON THE EYE—New Edition—Preparing.

A TREATISE ON DISEASES OF THE EYE. By J. SOELBERG WELLS, Prof. of Ophthalmology in King's College Hospital, etc. Third American, from the fourth and revised English edition, with additions; illustrated with numerous engravings on wood, and six colored plates. Together with selections from the Test-types of Jaeger and Snellen. In one large and very handsome octavo volume.

RAMSBOTHAM'S OBSTETRICS—Lately Issued.

THE PRINCIPLES AND PRACTICE OF OBSTETRIC MEDICINE AND SURGERY, in reference to the Process of Parturition. By FRANCIS H. RAMSBOTHAM, M.D. A new and enlarged edition, thoroughly revised by the author. With additions by W. V. KEATING, M.D., Professor of Obstetrics, etc., in the Jefferson Medical College, Philadelphia. In one large and handsome imperial octavo volume of 650 pages, with sixty-four beautiful plates, and numerous wood-cuts in the text, containing in all nearly 200 large and beautiful figures; strongly bound in leather with raised bands, $7 00.

WINCKEL ON CHILDBED—Lately Issued.

A COMPLETE TREATISE ON THE PATHOLOGY AND TREATMENT OF CHILDBED, for Students and Practitioners. By F. WINCKEL, Professor and Director of the Gynæcological Clinic in the University of Rostock. Translated with the consent of the author, from the second German edition, by JAMES READ CHADWICK, M.D. In one octavo volume. Cloth, $4 00.

TUKE ON THE MIND—Lately Issued.

ILLUSTRATIONS OF THE INFLUENCE OF THE MIND UPON THE BODY IN HEALTH AND DISEASE. Designed to illustrate the Action of the Imagination. By DANIEL HACK TUKE, M.D., joint author of "The Manual of Psychological Medicine," etc. In one handsome octavo volume of 416 pages. Cloth, $3 25.

NEW WORKS IN PRESS.

NETTLESHIP ON THE EYE—Nearly Ready.

THE STUDENT'S GUIDE TO DISEASES OF THE EYE. By Mr. NETTLESHIP, Ophthal Surgeon to St. Thomas's Hospital, London. In one neat royal 12mo. volume, with nu rous illustrations.

The effort of the author has been to bring within the compass of a volume of moderate s the information needed by the student of clinical ophthalmology, as a guide for the diagn and treatment of cases; and the wide experience of the writer in one of the largest of London hospitals is a guarantee of his ability to accomplish the task. Few general practitio have leisure for the study of the more ponderous treatises on ophthalmology, while all are lia at any moment to be consulted in cases of eye diseases and injuries, rendering almost ind pensable a compact and convenient volume, like the present, in which may be found the nec sary information divested of superfluous detail.

ALLEN'S ANATOMY—Shortly.

A SYSTEM OF HUMAN ANATOMY: INCLUDING ITS MEDICAL AND SURGICAL R LATIONS. For the Use of Practitioners and Students of Medicine. By HARRISON ALLE M.D., Prof. of Comparative Anatomy and Physiology in the Univ. of Pa. With an Intr ductory Chapter on Histology, by E. O. SHAKESPEARE, M.D., Ophthalmologist to the Phi Hospital. In one large and handsome quarto volume, with several hundred original illu trations on lithographic plates, and numerous wood-cuts in the text.

CORNIL & RANVIER'S PATHOLOGICAL HISTOLOGY—Shortly.

MANUAL OF PATHOLOGICAL HISTOLOGY. By V. CORNIL, Prof. in the Faculty of Med cine, Paris, and L. RANVIER, Prof. in the College of France. Translated, with Notes an Additions, by E. O. SHAKESPEARE, M.D., Pathologist and Opthhalmic Surgeon to Philad Hospital, Lecturer on Refraction and Operative Ophthalmic Surgery in Univ. of Pa., and J. HENRY C. SIMES, M.D., Demonstrator of Pathological Histology in the Univ. of P In one very handsome octavo volume of about 600 pages, with over 300 illustrations.

FOSTER'S PHYSIOLOGY—Shortly.

TEXT-BOOK OF PHYSIOLOGY. By MICHAEL FOSTER, M.D., F.R.S., Prof. of Physiolog in Cambridge Univ. Third and revised edition. In one 12mo. volume. With illustration

After a careful perusal of the entire work, we can confidently recommend it, both to the student and the practitioner, as being one of the best text-books on physiology extant.—*Lancet.*

It is not often that medical literature is enrich by a book which promises to be of such permane value.—*British Medical Journal.*

GREENE'S MEDICAL CHEMISTRY—Shortly.

A MANUAL OF MEDICAL CHEMISTRY, for the Use of Students, based upon BOWMAN MEDICAL CHEMISTRY. By WILLIAM H. GREENE, M.D., Demonstrator of Chemistry in Med Dept. Univ. of Penna. In one royal 12mo. volume of about 400 pages. With illustration

MORRIS ON SKIN DISEASES—Shortly.

SKIN DISEASES; INCLUDING THEIR DEFINITION, SYMPTOMS, DIAGNOSIS, PROGNOSIS, MORBID ANATOMY, AND TREATMENT. A Manual for Students and Practitioners. By MALCOLM MORRIS, Joint Lecturer on Dermatology, St. Mary's Hospita Medical School. In one 12mo. volume of over 300 pages.

ROBERTS ON RENAL DISEASES—New Edition—Shortly.

A PRACTICAL TREATISE ON URINARY AND RENAL DISEASES, INCLUDING URINARY DEPOSITS. By WILLIAM ROBERTS, M.D. Lecturer on Medicine in the Manchester School of Medicine, etc. Illustrated by numerous cases and engravings. Third edition. In one handsome 8vo. volume.

CHARCOT ON NERVOUS DISEASES—Shortly.

LECTURES ON THE DISEASES OF THE NERVOUS SYSTEM. Delivered at La Salpêtrière, by J. M. CHARCOT, Professor to the Faculty of Medicine of Paris; Physician to La Salpêtrière, etc. Translated from the second edition, by GEORGE SIGERSON, M.D., M.Ch., Lecturer on Biology, etc., Catholic University of Ireland. In one octavo volume of 288 pages. With illustrations.

BRUNTON'S MATERIA MEDICA—Preparing.

PHARMACOLOGY AND THERAPEUTICS; or, Medicine Past and Present. By T. LAUDER BRUNTON, M.D., F.R.S., etc.

WOODBURY'S HANDBOOK OF PRACTICE—Preparing.

A HANDBOOK OF THE PRINCIPLES AND PRACTICE OF MEDICINE; for the use of Students and Practitioners. Based upon Husband's Handbook of Practice. By FRANK WOODBURY, M.D., Physician to the German Hospital, Philadelphia, late Chief Asst. to Med. Clinic, Jefferson College, etc. In one neat volume, royal 12mo.

WORKS BY AUSTIN FLINT, M.D.,

Professor of the Principles and Practice of Medicine and of Clinical Medicine in Bellevue Hospital Med. College, N. Y.

CLINICAL MEDICINE:

A Systematic Treatise on the Diagnosis and Treatment of Diseases.

DESIGNED FOR THE USE OF STUDENTS AND PRACTITIONERS OF MEDICINE.

In one large and handsome octavo volume of seven hundred and ninety-five pages. Cloth, $4 50; *leather*, $5 50. (*Just Ready.*)

The author of the above work has anticipated a want long felt by those for whom it was especially written—the clinical student during his pupilage, and the busy practitioner. He has given to the medical profession a very necessary and useful work, complete in detail, accurate in observation, brief in statement.—*St. Louis Courier of Med.*, Oct. 1879

There is every reason to believe that this book will be well received. The active practitioner is frequently in need of some work that will enable him to obtain information in the diagnosis and treatment of cases with comparatively little labor. Dr. Flint has the faculty of expressing himself clearly, and at the same time so concisely as to enable the searcher to traverse the entire ground of his search, and at the same time obtain all that is essential, without plodding through an interminable space. —*N. Y. Med. Jour.*, Nov. 1879.

We consider this the best book on clinical medicine ever published. It should be in the hands of every student, and no teacher or practitioner's library is complete without it. To enumerate all its excellences would be to repeat the entire book. —*Louisville Med. News*, Oct. 25, 1879.

The eminent teacher who has written the volume under consideration has recognized the needs of the American profession, and the result is all that we could wish. The style in which it is written is peculiarly the author's; it is clear and forcible, and marked by those characteristics which have rendered him one of the best writers and teachers this country has ever produced. We have not space for so full a consideration of this remarkable work as we would desire.—*St. Louis Clin. Record*, Oct. 1879.

It is venturing little to say that there are few men so well fitted as Dr. Flint to impart information on these last mentioned subjects, and the present work is a timely one as relates both to the author's capacity to undertake it and the need for it as an accompaniment to the multitude of publications now issued, in which the subject of treatment is but little considered.—*New Remedies*, Nov. 1879.

As a whole, we think that if possible it surpasses any of the author's former works. Better than any, it gives scope for the author's infinitely varied attainments, his rare analytical powers, and his matured judgment. Most heartily do we commend this model clinical work to every advanced medical student and practising physician.—*Detroit Lancet*, Nov. 1879.

II.

A TREATISE ON THE PRINCIPLES AND PRACTICE OF MEDICINE;

DESIGNED FOR THE USE OF STUDENTS AND PRACTITIONERS OF MEDICINE.

Fourth Edition, Revised and Enlarged.

In one large and closely printed octavo volume of nearly 1100 *pages: cloth*, $6; *or strongly bound in leather*, *with raised bands*, $7.

Has never been surpassed as a text-book for students and a book of ready reference for practitioners. The force of its logic, its simple and practical teaching, have left it without a rival in the field.—*N. Y. Med. Record*, Sept. 15, 1874.

This excellent treatise on medicine has acquired for itself in the United States a reputation similar to that enjoyed in England by the admirable lectures of Sir Thomas Watson. It may not possess the same charm of style, but it has like solidity, the fruit of long and patient observation, and presents kindred moderation and eclecticism. We have referred to many of the most important chapters, and find the revision spoken of in the preface is a genuine one, and that the author has very fairly brought up his matter to the level of the knowledge of the present day. The work has this great recommendation, that it is in one volume, and therefore will not be so terrifying to the student as the bulky volumes which several of our English text-books of medicine have developed into. —*British and For. Med.-Chir. Rev.*, Jan. 1875.

Prof. Flint, in the fourth edition of his great work, has performed a labor reflecting much credit upon himself, and conferring a lasting benefit upon the profession. The whole work shows evidence of thorough revision, so that it appears like a new book written expressly for the times. For the general practitioner and student of medicine, we cannot recommend the book in too strong terms.—*N. Y. Med. Journal*, Sept. 1873.

III.

A MANUAL OF PERCUSSION AND AUSCULTATION; OF THE PHYSICAL DIAGNOSIS OF DISEASES OF THE LUNGS AND HEART, AND OF THORACIC ANEURISM. In one handsome royal 12mo. volume of 255 pages: cloth, $1 75. (*Lately Issued.*)

IV.

PHTHISIS—ITS MORBID ANATOMY, SYMPTOMATIC EVENTS AND COMPLICATIONS, FATALITY AND PROGNOSIS, TREATMENT AND PHYSICAL DIAGNOSIS, IN A SERIES OF CLINICAL STUDIES. In 1 large and handsome 8vo. vol. of 446 pages: cloth, $3 50.

V.

ESSAYS ON CONSERVATIVE MEDICINE AND KINDRED TOPICS. In one very handsome royal 12mo. volume of 214 pages. Cloth, $1 38.

VI.

A PRACTICAL TREATISE ON THE DIAGNOSIS, PATHOLOGY, AND TREATMENT OF DISEASES OF THE HEART. Second revised and enlarged edition. In one octavo volume of 550 pages, with a plate: cloth, $4.

VII.

A PRACTICAL TREATISE ON THE PHYSICAL EXPLORATION OF THE CHEST AND THE DIAGNOSIS OF DISEASES AFFECTING THE RESPIRATORY ORGANS. Second and revised edition. In one handsome octavo volume of 595 pages: cloth, $4 50.

HENRY C. LEA—Philadelphia.

NOTICE TO SUBSCRIBERS.

INCREASED INDUCEMENTS FOR 1880.

With a view of increasing the attractions of the "AMERICAN JOURNAL OF THE MEDICAL SCIENCES," and of bringing within the reach of all members of the profession the immense amount of information now presented by it and its accessory periodicals, the "MEDICAL NEWS AND LIBRARY" and the "MONTHLY ABSTRACT," the two latter will hereafter be merged together, under the name of "THE MEDICAL NEWS AND ABSTRACT," commencing January 1, 1880. The "NEWS AND ABSTRACT" will consist of sixty-four pages per month, handsomely printed, in a neat cover, and will contain all the material heretofore presented in both periodicals, with the exception of the sixteen pages of the "Library Department." Its price will be TWO DOLLARS AND A HALF per annum, invariably in advance, at which rate subscribers will receive nearly *eight hundred large octavo pages per annum*, free of postage.

Not only will this monthly thus be in itself one of the cheapest periodicals offered to the profession, but it will be furnished in commutation, without charge, to advance-paying subscribers of the "AMERICAN JOURNAL OF THE MEDICAL SCIENCES," the subscription to which will remain, as heretofore, FIVE DOLLARS per annum. For this very moderate sum, therefore, subscribers will receive two periodicals of the highest class, a Quarterly and a Monthly, containing in all nearly two thousand pages per annum, stored with the choicest original and selected matter that can be furnished by the medical literature of both hemispheres.

These terms may be recapitulated as follows:—

TERMS FOR 1880.

The AMERICAN JOURNAL OF THE MEDICAL SCIENCES, published quarterly (1150 pages per annum), and The MEDICAL NEWS AND ABSTRACT, published monthly (768 pages per annum),	Five Dollars per annum, in advance.

SEPARATE SUBSCRIPTIONS TO

The AMERICAN JOURNAL OF THE MEDICAL SCIENCES, when not paid for in advance.	Five Dollars.

The MEDICAL NEWS AND ABSTRACT, invariably in advance, Two Dollars and a Half.

⁂ Advance-paying subscribers can obtain, at the close of the year, cloth covers, gilt lettered, for binding the volumes of the JOURNAL (two annually) and the NEWS AND ABSTRACT (one annually), free by mail, on remitting ten cents for each cover.

It is evident that only a very considerable increase to the existing subscription list will justify the unexampled terms thus offered, by which the equivalent of three or four large octavo volumes is furnished, free of postage, for the trifling sum of FIVE DOLLARS. Gentlemen, therefore, are respectfully requested to lose no time in remitting their subscriptions, to avoid the risk of disappointment from the exhaustion of the edition printed; and it is suggested that they may aid in rendering the enterprise permanent by kindly communicating to their friends the very great inducements thus offered.

The safest mode of remittance is by bank check or draft, or postal money order drawn to the order of the undersigned. Where these are not accessible, remittances for the "JOURNAL" and "NEWS AND ABSTRACT" may be made at the risk of the publisher by forwarding in REGISTERED letters. Address

HENRY C LEA,
Nos. 706 and 708 SANSOM STREET,
PHILADELPHIA, PA.

Entered at the Post-Office at Philadelphia as Second-class matter.

VOL. XXXVIII. NO. 2. FEBRUARY, 1880. WHOLE NO. 446

THE

MEDICAL NEWS

AND

ABSTRACT.

A CONSOLIDATION OF THE "MEDICAL NEWS AND LIBRARY" AND THE "MONTHLY ABSTRACT OF MEDICAL SCIENCE."

EDITED BY

I. MINIS HAYS, A.M., M.D.

PHILADELPHIA:
HENRY C. LEA.
1880.

PUBLISHED MONTHLY AT $2.50 PER ANNUM IN ADVANCE.
Furnished in conjunction with the Quarterly American Journal of the Medical Sciences (in all nearly 2000 octavo pages) for $5.00 in advance.

Entered according to the Act of Congress, in the year 1880, by HENRY C. LEA, in the Office of the Lib
of Congress. All rights reserved.

NEW MEDICAL WORKS.

CORNIL & RANVIER'S PATHOLOGICAL HISTOLOGY—Just Ready.

A MANUAL OF PATHOLOGICAL HISTOLOGY. By V. CORNIL, Asst. Prof. in the Faculty of Medicine of Paris, and L. RANVIER, Prof. in the College of France. Translated, with Notes and Additions, by E. O. SHAKESPEARE, A.M., M.D., Microscopist to the Philada. Hospital, and J. HENRY C. SIMES, M.D., Lecturer on Histology in the Univ. of Pa. With 360 Illustrations on Wood. In one large and very handsome octavo volume of nearly 800 pages: leather, $6 50; cloth, $5 50.

The work of Cornil and Ranvier is so well known as a lucid and accurate text-book on its important subject, that no apology is needed in presenting a translation of it to the American profession. It is only necessary to say that the labors of Drs. Shakespeare and Simes have been by no means confined to the task of rendering the work into English. As it appeared in France, in successive portions, between 1868 and 1876, a part of it, at least, was somewhat in arrears of the present state of science, while the diffuseness of other portions rendered condensation desirable. The Translators have therefore sought to bring the work up to the day, and at the same time to reduce it in size, as far as practicable, without impairing its completeness. These changes will be found throughout the volume, the most extensive being in the sections devoted to Sarcoma, Carcinoma, Tuberculosis, the Bloodvessels, the Mammæ, and the Classification of Tumors. Corresponding modifications have been made in the very extensive and beautiful series of illustrations, and every care has been taken in the typographical execution to render it one of the most attractive volumes which have issued from the American press.

NETTLESHIP ON THE EYE—Just Ready.

THE STUDENT'S GUIDE TO DISEASES OF THE EYE. By EDWARD NETTLESHIP, Ophthalmic Surgeon to St. Thomas's Hospital, London. In one neat royal 12mo. volume of 370 pages, with 89 illustrations. Cloth, $2.

The effort of the author has been to bring within the compass of a volume of moderate size the information needed by the student of clinical ophthalmology, as a guide for the diagnosis and treatment of cases; and his wide experience in one of the largest of the London hospitals is a guarantee of his ability to accomplish the task. Few general practitioners have leisure for the study of the more ponderous treatises on ophthalmology, while all are liable at any moment to be consulted in cases of eye diseases and injuries, rendering almost indispensable a compact and convenient volume, like the present, in which may be found the necessary information divested of superfluous detail.

DUNCAN ON WOMEN—Just Ready.

CLINICAL LECTURES ON THE DISEASES OF WOMEN. Delivered in St. Bartholomew's Hospital. By J. MATTHEWS DUNCAN, M.D., LL.D., F.R.S.E., etc. In one very neat octavo volume of 175 pages. Cloth, $1 50.

Prof Matthews Duncan's originality and suggestiveness are sufficient guarantee that whatever he may see fit to lay before the profession is well worth attention; while the importance of the subjects discussed in the present volume will give it special attractiveness to the practising physician.

ROBERTS ON RENAL DISEASES—New Edition—Just Ready.

A PRACTICAL TREATISE ON URINARY AND RENAL DISEASES, INCLUDING URINARY DEPOSITS. By WILLIAM ROBERTS, M.D., Lecturer on Medicine in the Manchester School of Medicine, etc. Third American, from the third revised and enlarged English edition. Illustrated by numerous cases and engravings. In one handsome 8vo. volume of over 600 pages. Cloth, $4.

FOSTER'S PHYSIOLOGY.—In Press.

A TEXT BOOK OF PHYSIOLOGY. By MICHAEL FOSTER, M.A., M.D, F.R.S., Prof. of Physiology in Cambridge Univ. England. A new American, from the third English edition. Edited, with additions, by EDWARD T. REICHERT, M.D., Demonstrator of Experimental Therapeutics in Univ. of Penna. In one handsome royal 12mo. volume, with over 250 illustrations.

The excellence of Mr. Foster's work as an exposition of functional physiology has long been recognised, while for the purpose of the student it has been somewhat deficient as respects the details of structure so necessary to render intelligible the views and theories of the science. These it has been the effort of the editor to add in as concise a manner as possible, and in aid of this he has freely introduced illustrations from recognised authorities. In this improved form it is therefore hoped that the work may prove more than ever acceptable to the student as a clear and comprehensive text-book presenting the science in its latest development.

Without having space to attempt even a statement of the contents, we will add that this is the text-book on Physiology that most nearly conforms to our ideal of what such a book should be.—*Va. Med. Monthly*, Jan. 1880.

There appears to be but one opinion among teachers of physiology respecting it, and it has been adopted as the text-book on the subject in the majority of English schools. It forms the very best text-book on this subject, and as such we heartily commend it to practitioners and students.—*Canada Med. and Surg. Journ.*, Jan. 1880.

Teachers and students of physiology will find it a storehouse of knowledge, and every practitioner should read it.—*Louisville Med. News*, Dec. 13, 1879

CLINICS.

Clinical Lectures.

THE TRUE AND FALSE PALSIES OF HYSTERIA.

BY S. WEIR MITCHELL, M.D., OF PHILADELPHIA,
MEMBER OF THE NATIONAL ACADEMY OF SCIENCES.

GENTLEMEN: The case to which I drew your attention at my last clinic is here again, a girl, rather wanting in the signs of sexual ripeness, although sixteen years old. You will recall the fact that she lost the use of the right arm because of having been alarmed. The scare brought on what every woman knows as an attack of hysterics—our ancestors called it the vapours. The girl cried and laughed by turns, and then had a slight fit, on coming out of which she could no longer lift her right arm, or rather she could lift it but a few inches. On finding this to be the case, she grew much concerned, and by and by could not lift it at all, the [illegible] that it could not be raised helping, as is apt to be the case, to make the trouble worse. There seems to have been no deceit, but perhaps the [illegible] feebleness may have been slight, and the power of her belief in her want of force—great—and this is rather the more likely since, as you saw, I raised the arm and said, "Now you can keep it up," which she did. [illegible] see that it seems again palsied. A new order restores it, and she [illegible] it without much effort, having won a belief in my being able to aid [illegible]. I send her away with a lightly uttered word or two as to the use of a hot iron, if she again loses power. The warning may answer or may not. We had a case very like this two years ago. I believe it got well.

We see here among the ill-fed, needy, and worried, a good many cases of hysterical loss of power, and I meet a yet larger number among women of the upper classes, where the disease is caused by unhappy love affairs, losses of money, and the daily fret and wearisomeness of lives, which passing out of maidenhood, lack those distinct purposes and aims which, in the lives of men, are like the steadying influence of the fly-wheel in an engine.

It is my present wish to speak of some of the many kinds of hysterical paralysis, and to state, so far as I can, the means which, in my own practice, have been used for the relief of these baffling and annoying cases.

The group of instances of lessened power which I shall here discuss will include the usual forms of hysteric paraplegia and hemiplegia, and that which I shall call double hemiplegia. I shall not attempt to cover the whole range of hystero-palsies, but seek chiefly so to define a certain number as to allow me to speak of their treatment. I shall also describe four forms of seeming loss of power, only one of which is hysteric in nature, and not found elsewhere with the same features. I allude to hysterical motor ataxia.

The others are palsy from the rule of an idea, general paresis, and consciously mimicked palsy.

All three of these may be and are seen outside of hysteria, but they find in it a fertile soil, and are none the easier to treat when they are masking in this disguise.

One of the chief troubles in clearly knowing and in dealing with all of these forms of disease is due to the fact that in most cases they exist in union. The case of palsy may be partly real, partly pure weakness, which can be overcome, partly loss of power from want of belief in being able to move, or conscious mimicry may be added to palsy or to the forbidding influence of a regnant idea, or to the true hysteric palsy may be joined ataxy of motion. For such vexing marriages of disorders, and for their offspring of doubt, we must be ready and watchful. They make hysteric lack of power hard to define, hard to treat, full of surprises, and unfailing in interest and variety. Take this for an instance: You have a case of extreme hysteric paresis to treat. As a rule it is readily cured. You predict a clear and happy future. As time wears on the mere weakness is gone, the limbs are plump again, the cheek red, and then you find, as I have found, that hidden in the mere weakness there is a distinct amount of motor palsy—a mild, one-sided, loss of power—a true hysteric palsy, and not at all easy to cure. I shall pick for you, out of my note-books, cases of each of the forms of disease I have just spoken of, and shall try to make plain to you how I treat them. There were once no cases so much dreaded by me. There are now none to which I go with so much pleasure. I am sure that I treat them to-day with a success I could not once have gained, and I think that what success I have had has been due to more exact ideas as to what is needed, and that unflinching purpose and action which grow out of distinct views.

The first case I shall state ended in death, and is for that reason the more strange because death in hysteria is rare.

Mrs. C., æt. 36, a strong woman, and in all ways well, lost by sudden death a child and her husband. Thus having cast on her the care of a large estate, loaded with many burdens, she began to show excess of anxiety as to her affairs, and from being sweet of temper became abrupt and full of unreasonable doubt as to her advisers. The worry brought with it speedy loss of blood globules, and as she was a woman who flowed very fully each month, all these causes together began to tell. This is the kind of thing we see much of in medicine. The books say this, that, or the other causes Hysteria. In practice it is usual to find two or three causes—acting to assist one another. This woman was quite ready for an outbreak of some form of nerve trouble, when of a sudden she met the final blow in the form of a telegram. The news it bore was neither good nor ill, but by evil luck the writing looked like that of her dead husband, and she began to laugh with that strange want of appropriateness in emotional expression so common in the nervous. Awaking next day her legs seemed heavy, which caused her great alarm. At once, as she told me, the fear of palsy arose in her mind, and haunted her the more as, day by day, the feebleness grew worse. She was in Germany when taken ill, and seems to have been looked upon as suffering from an organic malady, for she was treated with nitrate of silver and the hot iron. Then as she failed to get relief anywhere, she was sent from one spa to another with a skill which we are yet far from being able to reach, and at last came home to America, where I saw her often and until the close of her life.

This was what I found: A woman of 35, height 5 feet 2, weight 170, flabby, and thin blooded; all the organs were normal. On the left side of the vagina was felt a tumour about the size of a walnut. It was very tender, and firm pressure on it gave rise to nausea and distress down the left leg. I had no doubt that this growth was a displaced ovary, but, despite this change of place, the left iliac fossa was tender to touch, with what we call ovarian tenderness. Was it ovarian? Hardly, in this case. I have been told by Dr. Goodell that he has seen this same sensitiveness in other cases where the ovary had been displaced, and probably too much has been and is made of this symptom. The tenderness in Mrs. C.'s case was strange because it was, so to speak, an island, and all about it to the waist and down to the feet the body was without sense of touch or pain, or of heat and cold. In tracing this defect upwards it was found to cover the left breast, but this was so to-day, and then to-morrow it was less, the upper limit ranging from the navel to the left armpit.

Motor power was failing when I first saw her, but this had been the case before, and had been followed by a change for the better.

The plan pursued in treating the case was one to which I groped my way a few years ago. My patient was very thin blooded, and yet very fat. Such cases for some reason not clear to me are more hard to redden than are those of thin people in like states of blood. But if you can safely cause these persons to lose flesh, as they are helped to remake it, you may sometimes redden them with ease, and to double the number of blood globules is sometimes to lift a woman above the low level of health, which is one, at least, of the factors of hysteria.

Mrs. C. was, when I saw her, sitting up most of the day, and sewing, writing, and the like, when not too nervous. I put her in bed, and employing as a diet milk alone, with a little rice water or barley water, I began to lessen the amount given, until, using less than a quart a day, her weight fell off at the rate of about a quarter to half a pound a day. When she showed signs of weakness I added beef soup to the diet for a day or two, and thus in one month brought down her weight some twenty-four pounds. This could not with safety be so quickly done unless the patient were kept inert and supine. Then the milk was by degrees increased. Raw beef and vegetables were added, malt extract was used before meals, a little red wine or champagne was allowed, and iron was given freely, the feeding being frequent. When I made the increase in diet I began to arouse sensation by the use of the wire brush, and with induction currents.

Now in common palsies, or in those from nerve wounds, feeling is apt to come back first, motion last; but in hysteric palsies, as I think, the gain in action and motion may go on, and even reach a useful amount while yet the lack of feeling rests as it was when the treatment began. Just this change took place in Mrs. C.: She grew brighter, more happy, gained in colour and flesh, and began to move her legs. In a month after she reached full diet she could walk with some trouble, and about this time the sense of touch showed signs of betterment, but the power to feel pain was unchanged, and, in fact, was never complete in the left leg.

Next began a plan of steady, urgent calls upon her for increase of the use of her limbs, so that before long she was able to walk out of doors. At this point I fear there was a mistake made in the treatment. Thinking the battle won I pushed her too hard, and one day after walking much further than usual she felt an excess of fatigue. Returning home she gave out of a sudden, and the morning after was again unable to stir either leg. I may pause here to repeat as to this matter a warning I have often given. It is to urge on you the utmost care as to allowing a hysterical patient on the way to health—I mean, of course, one who has lost power—to do more each day than fulfil the ordered task of that day. Most cases of hystero-palsies are easily tired, and it is almost sure to be the case that they cannot make a long effort without showing the effect in some way; moreover the mental results of extreme tire are to be feared, because any positive, real sensation is apt to become the peg, so to speak, on which the patient may hang the complement of a larger and less real sensation.

More slowly this time Mrs. C. got back some control over her movements, but at a certain point the gain ceased, and we made no further progress, nor did this surprise me. Hysterical paraplegia is more hard to cure than any other hysterical trouble except, perhaps, multiple contractures, and I felt that I had done well to win what I had won.

About six months later this lady died after a brief illness, which seemed to me more like a sudden and complete palsy of the pneumogastric nerves than anything else. No examination post mortem was allowed. I have known three deaths in hysteria; all were abrupt, and two were due to acute congestion of the kidneys.

Of that more common type, the palsies of one side of the body, you have seen a number. They are more frequent than paraplegias; less hard to cure, but quite lasting enough to make you cautious as to what you predict about the future. Where they occur in the feeble and thin-blooded, who have by degrees grown emotional, tearful, and weak of will, you may have more hope of helping them than if they are met with in robust people of non-emotional type. Such there are—people in whom the usual emotional elements which go to build up this temper of mind are wanting, or are small in amount. The former offer through the relief of their nutritive defects chances of obvious nature; the latter are apt to be bright or even able women, who enlist their mental forces in behalf of their symptoms, and treat the hated charge of being hysterical with utter scorn.[1]

I shall not take then the most common cases of hysteric hemiplegia, but one of the forms not well described as yet, and which I shall, in advance, venture to call double hemiplegia. This, as we shall see, is not merely another name for paraplegia.

Miss B., a sturdy, handsome girl, æt. 16 years, had a series of ills one on another from time to time. The first sign of trouble was twitches of the eyelids, and tears on reading; then there was a pause of two years. The next disturbance was a noisy and obstinate hiccup, during which the iliac fossæ became tender, and a single hypodermic use of morphia was followed by convulsions. Next came hysteric loss of desire for food, nausea, pains in the left arm and leg, and spasm of the vessels in the left leg, so that it became white and cold. Up to this time she still walked out; but in the summer of 1878 the use of galvanism is said to have been followed by sick stomach and loss of power to stand. In the autumn she got rid of immense masses of hard feces, when all the symptoms improved for a time. The next winter was passed in bed, vomiting a good deal; eating little; the bowels very hard to move; the urine passed every hour. About this time also she began to shun light, and came at last to living, with covered eyes, in a darkened room. When I saw this young lady I was struck with the thorough type of the emotional hysteric person she showed; nor from the usual weak will to the usual love of sympathy was there any tint wanting to the picture. I watched her for a few days without ordering treatment until I learned all I could of herself, her history, her home-life, her pursuits, her ambitions, and her mental powers. Then a talk with a watchful nurse helped me further, and I saw clearly that I had to do not with a clever woman who may be won over, and who is flattered by the tribute paid to her mind when you insist that to cure her she must be made to understand and agree with you, but with a child who to be made well had to be calmly and firmly ruled, and held day by day to rigid account. She was at once shut up, with a good nurse, and kept at rest in bed, not being allowed to use her hands even to feed herself. As she had been able to knit and sew, and be read to, and to receive many visits, the sense of the irksomeness of the treatment soon made her eager to do anything I wished. Then began a system of bribes. She was told that if she could learn to bear the light she would be able to be read to, but that the nurse could not be allowed to strain her eyes. It would have been easy to open the windows and say you must bear the light, but if she herself gained this point of vantage, it would have the great value of being a self-conquest. In a few days I found the sunlight bright in her room. Then she was asked to overcome the habit of regurgitating her food. One or two scoldings, some show of disgust, and the promise that she should soon feed herself if she obeyed my wishes, helped us through with this. There were relapses; but as I found she hated milk I felt forced to put her back on the milk diet we began with whenever she threw up a meal, so that before long we heard no more of the vomiting; meanwhile the steady feeding and the use of massage, and local muscle treatment by electricity, began to show in a gain of flesh and colour and firmness of muscle. She was now very weary of this unending quiet, and the time for education of the motor powers seemed to have come. Her loss of motion on the left side was very marked, and there was complete want of power to feel pain or to tell heat from cold; yet I could not make out any loss of vision or of colour-sense. The touch was not perfect, but she knew fairly well where she was touched, although she could not be tickled.

---

[1] I ought, perhaps, to add that these women are usually mobile and excitable by nature, prone to laughter more than tears, so that it is hardly exact to say they are not emotional. Their form of too ready emotional disturbance lies merely in an unusual direction for the victims of hysteria.

As regards the pain sense there was one very curious point, and I have seen this before. As the needle came within an inch or two of the middle line of the body it was felt, and the better felt the nearer it came to this line; nor do I recall having met with this fact in any case of palsy from organic cause. The right side of the body was palsied in a less degree, and only as to motion the leg far more than the arm. The same was the case on the left side as regards all the forms in which the functions were deficient. Now as this case grew better the right side became well first, leaving the left hemiplegia as before, so that I have reason to speak of the whole loss as being due to a double hemiplegia. In other cases I have seen a general loss of sense and motion, and observed entire relief on the right side, leaving only a hemiplegia of the left.

My patient had some wasting of the left leg, and less good electro-muscular reaction on the left, but no pain on that side from any form of current. The tendon reflex below the knee-pan was good on the right; about one-half of this on the left; and what was new to me the jerk was sometimes due to the extensor, and sometimes due to the flexors, the extensors in the second case not seeming to move at all. Here was another of the oddities of this most strange disorder.

As is usual she moved her limbs best while in bed, and showed, when I came to let her sit up, or stand, the loss of balancing power, which is seen in all grave hysteric palsies, and is, indeed, almost a sure sign of the parentage of the disease.

I have often asked you to note another point which this case showed very well. You ask the patient to raise the leg. It is lifted an inch; you insist on effort, it is lifted higher; or if a great effort be made the motion consists of a series of lifts and pauses.

The reliefs of distinct hystero-palsies are said to be often abrupt. Under emotion or return of the menstrual flow, or on an order from some one, the patient gets well. I must say that in hystero-hemiplegia and paraplegia, with loss of feeling, I have not been so happy as to see these delightful cures. In hysteria with mere paresis, in the palsies from belief, or from a ruling idea, I have seen such results many times. Neither do I believe that all hysteria *is after a time* within control of the sick person; nor that she can in all instances run away in case of a fire, according to a popular medical belief. In fact I have now in my care a lady who was so tested by chance, and quite utterly failed to do more than fall down in her effort to escape from a house on fire.

I have felt the need to say this, even if too briefly, because I must add that the cures are to be made by a slow, steady, hopeful training of the will powers through every-day effort, which needs some caution not to err in the way of excess. A little nervousness is a bad sign, and it is well each day to attempt a very little—no matter how little if only we succeed, and can make the patient see it. I shall in another case be more precise as to the means used. Enough to say of this case that it went on slowly gaining ground, and was under my care a year before the patient could walk well enough on crutches to go home with a cheerful future. It was not a brilliant case, and it taxed nurse and doctor to the uttermost—a case urged and scolded, and teased and bribed, and decoyed along the road to health; but this is what it means to treat hysteria. There is no short cut; no royal road.

Let us take another case. It was as much like the last as it could well be except that the greater loss was on the left side. But there was one matter in which it differed, and this changed my whole manner of dealing with the malady. My new patient was a clear-headed girl of 18 years, once having had a vigorous will. She was described to me as unselfish, thoughtful, and intelligent, and as a woman only brought down to a state of hysteria by long illness and the want of helpful advice at the right moment. She was emotional and ashamed of her tears, and honestly hated the whole matter of sickness. You will see such hysterical women. You will see others whose minds are like the back of a piece of needlework with a baffling absence of pattern, indistinct mentally, and with a low, whining, bleating voice that is by itself a tell-tale of the kind of will-less ataxia which seems to cripple the mind no less than the body. These are the hard cases to relieve. But to return to my more favourable case. I tried to make her see how much the defects of body have to do with those of mind, and therefore the need to begin by building up the body anew. When, after a time, the limbs began to round, and colour to come back to her pallid cheek, I set her to thinking how far the early troubles might have been within her control. I assured her that, although she could not now overcome at once the results due to habitual failure of self-control, repeated efforts would surely end in success. She was told that it was like the case of a bad temper, easy to hold in check at first, but if long unheld at last uncontrollable. It is not hard to open this point of view to a clever woman. You urge this idea from day to day; you ask her to try your way. She says I have done so, and then you point out that with ill health success was out of the question, while with rising health it might be easy. At last you get her to promise to fight every desire to cry, or twitch, or grow excited.

Above all you teach her the priceless lesson for a woman of the value of moods, of the ease with which she can get herself into a state of dangerous tension, of the necessity of learning not how to bear a thing, but how to approach the idea of bearing it in a state of calm. It is a long sermon, but I can only give these few pregnant texts. It is always apt to win with a woman of intelligence, and the fools are to be dealt with by other moral drugs than these, or the honest pill must be gilded with timely flattery or such better motives as may help it to find the woman's conscience, if that is to be stirred at all.

By and by, as one symptom after another gave way before her efforts, she became more and more sure that I must be right as to all; and I have seen few cases gain ground with equal speed. Nevertheless a whole year was needed to make her well able to take up afresh her full round of social and household duties. In fact even with the best of self-help from the patient the cure of any one of these cases is a long and arduous course of education.

Before leaving the subject of hysteric palsies I would say a few words as to the electric reactions. In most cases, and early in nearly all the muscle reactions are normal; but after a time, and in most old cases, these are less good than in health; nor do limbs long palsied fail to shrink somewhat, while marked wasting is rare. When there is loss of motion and of feeling Duchenne's axiom is correct; that is, we have then normal electric reaction of muscles and absence of all sensation of pain from the most severe currents. In some early cases I have seen a state of things not elsewhere spoken of. I saw it last week in a case of horrible chronic rhythmic spasms of the arms, with palsy of sense and motion in the legs. Dr. Yarrow, the attending physician, studied with me the electric state, which was curious. When with slow or rapid breaking of circuit (induced currents) we tested the leg muscles, the poles, even with currents unbearable by us, caused no motion until they had been steadily applied for from two to three minutes over any one muscle; but the reaction of nerve and muscle, one pole on each, was somewhat more rapid, although still very slow.

(*Conclusion in next Number.*)

ILLUSTRATIONS OF ANTISEPTIC SURGERY.

A Clinical Lecture delivered at King's College Hospital.

By JOSEPH LISTER, F.R.S.,
Professor of Clinical Surgery in King's College, London.

GENTLEMEN: We have here the little boy on whom, at a former lecture, rather more than three weeks ago, you saw me operate for empyema, letting out a large quantity of thick yellow pus from the left pleural cavity by free incision in the infra-axillary region. You have seen him, several of you, from time to time in the ward; but I am anxious that you should have the better opportunity which is afforded by the theatre of seeing the progress of the case. This dressing was put on three days ago; on that occasion it was changed after an interval of five days. There is no real need that I should change it to-day, but I do so for the sake of showing you the boy's condition. Now that I have removed the dressing under the spray, you observe that it is almost free from discharge of any kind; it is, in fact, dry. I shall withdraw the silver tube that we have in the wound for the purpose of draining the pleura. This tube is filled, as you see, with white lymph, and it was because I saw this lymph in the orifice of the tube that I thought it well to take it out to make sure that the passage was clear. By turning the boy on his side, so as to make the opening the most dependent part, I am able to empty the pleural cavity completely.

It turns out, as I suspected, that the lymph in the tube had obstructed it. The perfect dryness of the dressing, combined with the appearance of the lymph, made me suspect this; and you see we have obtained from the child one ounce, not of pus, but of slightly tinged serous fluid. I should have been better pleased, for the child's sake, to have found, as on former occasions in this case, an entire absence of any fluid in the pleura; but for your sakes I am glad to see this serum, because it illustrates all the more strikingly the effects of antiseptic treatment. For I venture to say that this purely serous accumulation could not have occurred without antiseptic management.

Let me remind you of the principal features of this case. The left pleura was greatly distended with pus; the heart was pushed over to the right side, so that its apex beat at the right nipple. Aspiration had been repeatedly practised by the physician under whose charge he had been, with the usual result of aspiration in empyema—reaccumulation of the fluid, and that fluid always yellow pus. We opened the pleural cavity by free incision antiseptically, and from the time it was opened we have had no more purulent discharge. Now I do not hesitate to say that that sort of result could not have been obtained without compliance with two conditions—viz., affording free drainage to the fluid, and, at the same time, preventing the access of putrefaction. The failure of the aspiration has shown you that relief of tension of a merely temporary character is not sufficient. Aspiration removes tension for the time being; but the fluid soon reaccumulates in sufficient amount to reproduce decided tension; and that tension, acting in a reflex manner through the nervous system, brings about inflammatory excitement of the pyogenic membrane, into which the pleura has been converted by disease, and so reproduces the suppuration, on the same principle as it had been maintained previously. Therefore mere temporary relief of tension is not enough; we must have the permanent relief afforded by free drainage. But if, on the other hand, we had provided the free drainage, and at the same time not adopted efficient antiseptic means, we should, we may be quite sure, have had a continuance of the suppuration; because, though tension would have been prevented, the irritation of putrid liquid would have acted on the pyogenic membrane of the pleura, and this could not have failed to stimulate it to pus-formation. In the present case, the tube having become accidentally obstructed, there had been again a little accumulation, not sufficient to reproduce suppuration—only an ounce of it; and this accidental circumstance has given you the opportunity of seeing for yourselves, in a very indubitable manner, that the fluid effused has been serum, not pus. You have thus before you a striking illustration of the beautiful pathological truth that a pyogenic membrane ceases to suppurate when freed from irritation. Had I shown you a dressing soaked with serous discharge, you might perhaps have thought, "Are we quite sure that there is not here some pus, masked by some action of the carbolic gauze upon it?" But when you have the serous fluid before you unmixed, as it is in this measuring glass, there can be no mistake whatever.

At the same time that the local condition has been thus satisfactory, the child's general state has been equally so. Before the pleura was opened, he was becoming very much reduced, and the appetite was extremely poor; since the operation, instead of suffering from a temporary fever, as would be likely to be the case if we opened the pleura without antiseptic measures, the little fellow has suffered no febrile disturbance whatever, but from the first began to improve, and is now like a different child, taking his food well, and increasing in strength from day to day.

It is worth while to remind you of the means by which these results have been obtained. In the first place the skin was well washed with the 1 to 20 watery solution of carbolic acid, which has the power of penetrating the epidermis and hair-follicles and any greasy dirt that there may be on the skin, so that it is quite unnecessary to do as many of our German friends do, wash the skin with soap and water and afterwards with sulphuric ether. Give the carbolic lotion a little time to act, and it will be sure to purify the integument.

In the next place, the instruments and hands having been cleansed with the same antiseptic lotion, we made an opening into the pleura under a thoroughly trustworthy carbolic spray. This, perhaps, of all cases of antiseptic surgery, is that which, on the one hand, most tests, and on the other most demonstrates, the efficacy of the spray. It tests it severely, because at every inspiration there is a drawing in of air in some form into the pleural cavity. If the patient is an adult, we can say to him, "Hold your breath," at the moment we make the incision; "Hold your breath," at the moment when we take off the deepest part of the gauze in changing the dressing; but with a young child, who is not amenable to persuasion, we can have no control over the respiration, and consequently during the operation, and also afterwards, at every change of dressing, air is drawn freely into the pleural cavity in some form or other. It is therefore necessary, if the spray is to be effectual, to be particularly careful to have a thoroughly reliable apparatus for its production, and that all our manipulations are so conducted that there shall never be a chance of any air other than spray being introduced.

Empyema is, therefore, a case requiring very special care in the use of the spray; but if that care has the effect of preventing putrefaction—and that this has been the case here is amply proved by the fact which you have all had the opportunity of verifying as I handed round the glass—viz., that the serum which has been accumulating for days is, nevertheless, absolutely odourless—if, I say, we avoid putrefaction completely from first to last, under the circumstances of empyema treated by free drainage, this is a complete proof of the efficacy of the spray. The pleura has been filled again and again in the course of these three weeks with atmosphere in the form of spray, and there can be no reasonable doubt that if ordinary unpurified air had entered in the same manner, carrying in its dust through the free opening, putrefaction would have occurred within the pleura. We have here, therefore, as good evidence as any experiment in a laboratory could afford of the power of the spray to correct the septic property of the atmosphere, or, in other words, to destroy the energy of the septic ferments which the atmosphere contains.

In the next place we have used carbolic gauze as a dressing. We have improved upon this gauze of late. The proportions we used of the ingredients were originally one part of carbolic acid to five of common resin, and seven of paraffin, the paraffin being added to prevent undue adhesiveness. We have now changed these proportions to one of carbolic acid, four of resin, and four of paraffin. By that means we have in the first place a gauze dressing with half as much carbolic acid again in it. It turns out that this is not too irritating, and therefore that is a great improvement; for the gauze is of course more efficacious antiseptically in proportion as it has more carbolic acid in it. From the diminution of the paraffin we have a little more adhesiveness, but that, I think, is positively an advantage. We do not find it causes any serious inconvenience, and on the other hand, it tends to prevent the disposition of dressings to slip upon the skin; it helps to keep them more securely in place. And then I may mention as a secondary, though not insignificant advantage, that though we thus increase so considerably the proportion of the carbolic acid, which is the most expensive ingredient, we have not added to the cost of the material as a whole, because pure paraffin[1] is so much more expensive than resin, that by diminishing the proportion of paraffin to the resin, we have cheapened the article more than we have enhanced its price by increasing the quantity of carbolic acid, so that the gauze is rendered slightly cheaper by this alteration of our proportions.

The gauze has been employed in the usual manner in eight layers, with a piece of mackintosh under the outer fold; but in a case like this we have also used the gauze in large amount in the form of loose-folded pieces underneath. In the earlier stages this is of great importance, because the flow of serum that takes place from the unsupported pleura in the earlier stages is exceedingly copious; therefore we have made the mass of gauze more than usual. In the adult it becomes necessary to change the dressings twice a day in these cases, but in this child the discharge being of course much less, once in the twenty-four hours proved sufficient.

Then, gentlemen, as to the keeping of this gauze dressing in position, you saw the elastic bandage round the edges of the dressing applied just sufficiently to bring the elasticity of the band into play, and so ensure that the edge of the dressing is always in contact with the skin, and thus, in spite of the respiratory movements, we get accurate apposition of the dressings, a point of great value with reference to the security of our results.

With regard to the kind of tube employed for drainage, for the first few days we had one of caoutchouc, as usual. There was only this difference as compared with its use in ordinary wounds: that into each of the two loops of silk connected with its orifice we introduced a substantial mass of gauze (soaked, like the deepest pieces of loose gauze, in the carbolic lotion), to make sure that the tube should not be sucked into the pleural cavity, as it might be if there were only the silk thread applied to the skin. If the drainage-tube were to enter the pleural cavity we should probably never be able to get it out again; and although it might perhaps lie there without causing disturbance, the occurrence is certainly one to be avoided. But in the course of a few days we found, as is usual in empyema treated by drainage, that the tendency of the thorax to contract on that side produced approximation of the ribs, so as to compress the india-rubber tube and interfere with the free flow of the discharge through it. We therefore substituted the metallic tube, about three-quarters of an inch long, long enough to go thoroughly into the pleural cavity, with a collar of metal to prevent it from slipping in, the tube being rounded at the end, with holes at the sides. It is sometimes the practice in Germany to cut away a piece of the rib in these cases to ensure free drainage. This I have not found to be at all necessary; the metallic tube, if used early enough before the ribs have got into contact, answers quite satisfactorily.

---

[1] I regret to find that a crude form of paraffin is sometimes employed in the manufacture of the gauze. It has the great disadvantage that it acts on the caoutchouc of the mackintosh cloth used in conjunction with the gauze, and soon makes it soft and useless. When pure paraffin is used the mackintosh will last for weeks together, and is thus in the long run very cheap, as well as perfectly trustworthy.

We have used carbolic acid in this case, although the child is only three years old. We have also in the hospital a child of only seven weeks, on whom I operated nearly a fortnight ago, on account of atresia aurium, and the head has since been kept enveloped in a carbolic-gauze dressing, without any interference with the infant's health. I mention these circumstances because I learned, to my great surprise, at Amsterdam lately, that it was considered by some surgeons an axiom that carbolic acid is so poisonous for young children that it should not be used for them at all; and I have since seen the same doctrine stated in print. Now, gentlemen, consider the circumstances of this little boy. In order to get a sufficiently large dressing on his small body, the carbolic gauze has been made to envelope his trunk from his armpits to his pelvis, and yet he has not suffered constitutionally at all; he has had no carbolic acid poisoning. This is sufficient to show that there is no need to abstain from the use of carbolic acid in young children from this fear. You may say, "How is it that we should not have carbolic acid poisoning, while some of our German brethren have it?" I believe the great secret of our comparative immunity from these toxic effects is that we avoid as much as possible all unnecessary action of the carbolic acid upon the tissues. Had I, for example, in this boy's case injected carbolic acid lotion into the pleural cavity, and done this at every dressing, as some persons might do, I think it is in the highest degree probable that he might have suffered from carbolic poisoning. Or, again, suppose the patient is not a child, but an adult, and suppose after making a considerable wound—as, for instance, in amputation of the thigh—you do as is often done on the Continent, viz., after stitching the edges of the wound together, and putting in drainage-tubes, inject a 1 to 20 carbolic acid solution with the syringe through the tubes. If I did such a thing as that, I should think it not at all unlikely that my patient might suffer from carbolic acid poisoning, because the interstices of the tissues just opened by the knife are ready to receive fluid that may be injected with any force towards them; and if you use a powerful syringe, and apply it to the orifice of a drainage-tube with the purpose of clearing out the wound, the cavity will probably be distended by the fluid, and there must be a great risk of having it forced into the interstices of the tissues, and thence passing in abundance by absorption into the circulation. This sort of practice is really quite unnecessary if you have a trustworthy spray, and operate so as to comply with the conditions of our physiological problem from first to last—conditions not difficult to comply with if we know that they are necessary, and keep a proper watch. And, again, in the changing of dressings there are many surgeons who, whenever they change the dressing under antiseptic treatment, make a point of syringing the wound out. There, again, is a most unnecessary application of carbolic acid to the system, and I believe the avoidance of this kind of practice is the principal cause of our immunity from carbolic-acid poisoning. I cannot point to one single instance in which I can be sure that we have had carbolic poisoning of any moment whatever, either in my hospital or private practice during the two years I have been in London.

At the same time I do not deny that in rare idiosyncrasies there may be carbolic-acid poisoning in spite of the avoidance of needless introduction of the agent into the system. I have seen such a thing myself. I have seen, for example, after removing the mamma and dressing with the gauze, the patient begin to suffer, not only from dark urine, which is in itself a matter of no moment, but from general debility, loss of appetite, and other symptoms of carbolic poisoning. We changed the gauze dressing for one of boracic acid, and immediately the symptoms disappeared. We left this boracic dressing on for several days, and then changed it under the carbolic spray; and time after time, as the result of the mere application of the carbolic spray to a limited portion of that lady's integument, did the symptoms of carbolic-acid poisoning return in a few hours, making it indubitable that that particular individual had a special idiosyncrasy for being so affected.

Now it is very desirable that, if such an occurrence should show itself, we should be prepared with means of an alternative character. I have alluded to the boracic-acid dressing. This is very good with superficial wounds or sores, as you have had the opportunity of seeing strikingly exemplified lately in a case of skin-grafting.

[The large callous and foul sore, having been dressed for a few days with a moist boracic lint covered with a gutta-percha tissue, was purified completely by sprinkling the surface lightly with the powder of iodoform, after washing the surrounding epidermis with strong watery solution of carbolic acid. Prepared oiled silk (protective) dipped in boracic lotion was then applied to the sore, and covered with boracic lint overlapping well in every direction. A similar dressing of oiled silk and boracic lint was applied every third or fourth day, until the granulations had assumed thoroughly healthy characters, when skin-grafting was performed by shaving a thin slice about a quarter of an inch across, consisting of little more than epidermis, from the inner side of the upper arm, which had been washed with 1 to 40 watery solution of carbolic acid, cutting this into small pieces on the thumb-nail, and placing each, with the raw surface downwards, on the granulations, each graft being covered, as it was deposited, with a little bit of the oiled silk dipped in boric lotion. A general piece of the oiled silk rather larger than the sore was then applied, and over this boric lint in two layers secured with a bandage. This dressing was left untouched for a whole week, so as to allow the grafts a long period without mechanical disturbance. We all know how black and foul oiled silk would be if left for a much shorter time upon a suppurating sore without the use of an antiseptic. But here it was quite free from discoloration or odour, while every one of the nine grafts was found to have taken root, and cicatrization was proceeding at the margins of the ulcer with a rapidity that could not have been hoped for under water-dressing changed daily.]

But we should not like to trust this mild boracic acid for deep-seated affections like empyema. What substitute, then, have we in case of the rare occurrence of carbolic-acid poisoning? I believe the best at present known is salicylic acid, first introduced into surgical practice by Prof. Thiersch, of Leipzig. It may be used in the form of salicylic jute, which is a pretty cheap material. Some weeks ago my friend Professor Bennett, of Dublin, told me of a case of empyema which he had to treat in the country. Carbolic gauze was not obtainable, but he had salicylic jute; he used this after opening the empyema under the carbolic spray, and he directed the country practitioner to apply the salicylic jute at every dressing on the same principle, and the result was a rapid cure after a course similar to that which you have been witnessing to-day. Here, then, we have evidence that in this exceedingly testing case, empyema, salicylic jute may answer the purpose as a satisfactory substitute for carbolic gauze. It must be applied in pretty large mass, and it will be well to have a piece of mackintosh outside, to prevent the discharge soaking directly through it.—*Lancet*, Dec. 20, 1879.

Hospital Notes.

Renal Abscess caused by a Fragment of Carious Vertebra Ulcerating into the Kidney and forming the Nucleus of a Renal Calculus.

A married woman, aged thirty-two, a music-hall dancer, was admitted into St. Mary's Hospital, Manchester, under the care of Mr. Cullingworth, on May 9th, 1879, ten days after her ninth confinement. She had followed her occupation up to within seven months of her admission, to which date she referred the commencement of her present illness. For two years, indeed, she had occasionally felt pain in the left lumbar region after prolonged exertion, but about the time alluded to, after completing an unusually laborious engagement, she was seized with pain of a more severe character, and she presently noticed a swelling below the ribs, which, gradually increasing, led her to think she must be pregnant of twins. She suffered considerable pain in the left hypochondrium as well as in the back, and occasionally she felt the pain shooting downwards in the direction of the bladder. There was never pain during micturition, or any blood noticed in the urine, but during the last three months of her pregnancy the urine had been turbid, and since her confinement had smelt most offensively.

On admission she was looking pale, worn, and extremely ill. There was a distinctly fluctuating swelling anteriorly below the ribs on the left side, extending inwards nearly to the middle line, and downwards as far as the iliac crest. The percussion note over the swelling showed that there was bowel between it and the abdominal parietes. There was no lateral bulging but on the left side of the upper lumbar vertebræ posteriorly. There was another and much smaller swelling, in which fluctuation was not obtainable, but which communicated, on pressure, an indistinct impulse to the swelling in front. The patient endured constant and agonizing pain, and the swellings, particularly that in front, were exquisitely tender. The urine contained a large quantity of fetid pus. On two occasions an unusually large quantity of pus was passed, and each time the tumour temporarily diminished in size. The morning temperature varied from 99° to 100°, that in the evening from 101° to 102°. The pulse was usually about 110, sometimes rising as high as 130. There was obstinate diarrhœa, and the patient perspired profusely.

On May 30th the posterior swelling was aspirated, with no result beyond blocking of the needle with what the microscope showed to be a quantity of broken-down tissue.

On June 13th an incision one ineh and a half long was made in the long axis of the posterior swelling. Immediately the skin was divided a quantity of reddish pultaceous material escaped, resembling what a fortnight before had blocked the aspirating needle. On passing in the finger, the transverse processes of the adjacent vertebræ were felt to be exposed and roughened from caries, and the lumbar muscles were found entirely disorganized and pulpified. At a depth of three inches from the surface a tense membrane was reached, evidently the posterior wall of the fluctuating tumour in front. Twelve ounces of fetid pus were withdrawn by the aspirator. The opening was then enlarged by means of a probe-pointed bistoury, the abscess explored, and two calculi removed with the aid of a small lithotomy-forceps. The cavity was syringed out, a drainage-tube inserted, the wound dressed with tenax, and the patient removed. She never rallied, and died on the third day.

Necropsy, twelve hours after death.—The left psoas muscle was almost completely disintegrated, the small portion remaining being closely adherent to the left kidney. The left transverse process, and the left side of the body of the second lumbar vertebra, had disappeared, and the tips of the left transverse processes of the first and third lumbar vertebræ were also implicated in the caries. The left kidney and ureter were enormously enlarged, and the pelvis of the kidney had become a distended suppurating cavity, which had been opened and partially emptied through the incision made posteriorly during life. At the bottom of one of the dilated calyces lay a calculus of the size of a half marble. The kidney itself was riddled with abscesses, and at its posterior and inner aspect, where it had been in close contact with the vertebral column and bound down to it by strong adhesions, there was an ulcerated opening permitting free communication between the diseased vertebræ and the interior of the kidney. There was no evidence of peritonitis or other morbid condition.

The largest of the three calculi was of a light colour and an extremely angular and irregular shape. At its centre, where it was bent at a slightly obtuse angle, was found a small nucleus of carious bone, and around this a layer of oxalate of lime, while the outer portions of the calculus consisted of phosphate with some admixture of carbonate of lime. The two smaller calculi, of which the one removed during life was about equal in size to a Calabar bean, were of a darkish-red mottled colour, and possessed a smooth surface. They were found on analysis to consist of phosphate and carbonate of lime. The weight of the largest calculus was 5.8 grammes, and that of the two smaller 1.87 grammes and .47 gramme respectively.

Remarks.—The sequence of pathological events in this case was unusual and interesting. It seems reasonable to suppose that the first morbid process was caries of the lumbar vertebræ, and that this was accompanied with chronic inflammation of the adjacent tissues, producing, in the case of the psoas muscle, disorganization, and in the case of the kidney, firm adhesion of the capsule to the vertebral column. A small portion of necrosed bone appears then to have made its way by ulceration through the substance of the kidney into the pelvis of that organ, where it became the nucleus of a calculus of considerable size, and the exciting cause of the formation of two smaller calculi. The patient's vocation as a public dancer would no doubt intensify the irritation produced by the presence of these calculi, the ultimate result of which was pyelitis, destructive suppuration, and death.—*Lancet*, Jan. 3, 1880.

MONTHLY ABSTRACT.

Anatomy and Physiology.

Localization of Function in the Cerebrum.

M. Jaccoud, in the *Gazette Hebdomadaire*, relates two cases which he is of opinion tell against the view that there are separate centres in the cerebrum. The first case is that of a man, aged forty-two, with suppurative meningitis. The right hemisphere was very hyperæmic, but presented no adhesions of the meninges, but the pia mater of the left hemisphere was infiltrated with pus, especially in the region of the central convolutions and central sulcus. The pia mater was adherent over the two upper thirds of these convolutions. During the last two days of life, the patient suffered from convulsions of the left side of the body, but there was no hemiplegia. M. Jaccoud sees in this case an example of unilateral convulsions in consequence of a stimulating lesion of the motor region of the same side. The subject of the second observation was a woman, aged eighty-three, who survived two days after an attack of apoplexy, and during this period suffered from hemiplegia of the right side, with anæsthesia. Speech was not disturbed, and death was the result of advanced phthisis pulmonalis. The left hemisphere was intact; the right presented an extensive flattened hemorrhage between the dura mater and the pia mater, covering the upper border of the hemisphere; so that the central sulcus was about its middle. No other lesion was visible. M. Jaccoud refers the hemiplegia in this case to compression of the upper parts of the eentral convolutions, but mentions also its occurrence on the same side.—*Lancet*, Jan. 3, 1880.

Influence of Sweating on the Digestive Power of the Gastric Juice, and on the Acidity of the latter and the Urine.

A paper, by M. Sassecki, contains the results of his investigations into this subject. His experiments were undertaken with a view to ascertain whether gastric juice and sweating stand in similar relation to each other as gastric juice and urine, *i. e.*, whether the acidity of the two remaining fluids decreases, if one of the three acid fluids (gastric juice, sweat, and urine) is either eliminated or neutralized. This view is supported by the fact that individuals who perspire much frequently suffer from dyspepsia. M. Sassecki has made 63 experiments: 48 on patients, and 15 on healthy people, and has come to the following conclusions: (1) Sweating decreases the digestive power of the gastric juice. (2) The acidity of the gastric juice is decreased. (3) Both the absolute and relative acidity of the urine is also diminished. (4) The stronger the perspiration, the more the digestive power and acidity of the gastric juice are lessened, as well as the acidity of the urine. These results suggest other questions. Would it not be possible to increase the acidity of the gastric juice and the urine by diminishing the secretion of the skin and the perspiration, viz., by atropin? Do not dyspeptic patients, or at least those among them in whom dyspepsia is caused by want of acidity in the gastric juice, suffer from frequent sweats? Should it not be possible to increase the acidity of the gastric juice, the secretion of the skin and perspiration, by rendering the urine alkaline by means of a vegetable diet? —*London Med. Record*, Dec. 15, 1879.

Materia Medica and Therapeutics.

Aconitia.

Dr. **Oulmont**, Physician to the Hôtel Dieu, terminates a memoir on aconitia, which he presented to the Académie de Médecine (*Gaz. des Hôp.*, Nov. 25) with the following considerations: It is a well-defined medicinal agent, which acts on man in a regular and certain manner, but which, on account of its energy, should only be employed in very small doses at long intervals. Frequently neuralgias are accompanied by well-marked intermittent and periodic accidents, to combat which quinine should be added. The important point, both for patient and physician, is to be able to rely upon a pure and unchangeable medicinal agent which is always identical in its composition and very scrupulously dosed. It is in order to attain this end that Dr. Moussette has prepared his pills, each containing very exactly a fifth of a milligramme of crystallized aconitia and five centigrammes of pure quinine. In consequence of the energetic action of the aconitia, the susceptibility of the patient should be tried by only commencing the first day with three pills—one morning, midday, and evening. If on the first day no marked sedative action is obtained, we may gradually augment the dose by a pill per diem until six are taken in the twenty-four hours, at which dose we should remain until the pain is subdued, only going beyond it in exceptional cases. If a little diarrhœa comes on, the dose should be diminished. To sum up, physiological investigations and clinical observations conducted in the Paris hospitals have demonstrated that the sedative action exerted by Moussette's pills on the circulatory apparatus, through the medium of the vaso-motor nerves, indicates their employment in neuralgia of the trifacial, congestive neuralgias, and in rheumatic, painful, and inflammatory affections. etc.—*Med. Times and Gaz.*, Dec. 6, 1879.

Anæsthesia by a New Method.

One of the most remarkable discoveries of the age is that attributed to Dr. **Paul Bert**, the Professor of Physiology at the Sorbonne, which consists of producing anæsthesia by a mixture composed of nitrous oxide or laughing gas and oxygen, which has already rendered signal service in the practice of surgery. Pure nitrous oxide has for a long time been employed for the minor operations in surgery, particularly for the extraction of teeth; but the period of anæsthesia is extremely short; and the asphyxia, though momentary, has sometimes been attended with fatal results. M. Paul Bert conceived the idea of preventing the asphyxia thus induced, preserving at the same time the anæsthetic properties of the nitrous oxide, by mixing it with oxygen, which he afterwards verified by experiment. He then came to the conclusion that, if anæsthesia were not produced in this case, it was owing to the gas not having its normal tension, and to its not being absorbed in sufficient quantity. This led him to try the mixture in a chamber of compressed air, which he extemporized for the purpose; and the success of the experiment far exceeded his expectations. The following is the process, which was lately communicated to the Therapeutical Society of Paris by M. Limousin, a very enterprising pharmacien. The gaseous mixture is effected in the proportion of 85 parts of nitrous oxide and 15 of oxygen; and generally it is administered under a pressure of 17 centimetres of mercury, which would represent, at the normal atmospheric pressure of 76, a total pressure of 93 centimetres. The tension of the nitrous oxide is, therefore, $\frac{85 \times 93}{75} = 105.4$; that of the oxygen is $\frac{15 \times 93}{75} = 18.6$; a proportion a little too strong for the former, and a little too weak for the latter. Nevertheless, anæsthesia was produced without asphyxia. The nitrous oxide is prepared from the nitrate of ammonia; and the oxygen is produced by decomposing, by the aid of heat, a mixture of chlorate of potash and the peroxide of manganese. The two gases are introduced into balloons of caoutchouc or vulcanized India-rubber, in the proportions indicated above; and the dose is regulated by a small gasometer similar to that employed by the Gas Company of Paris. The balloons are united by means of India-rubber and glass tubes, in such a manner that the gas enters a small intermediate balloon, which serves as a regulator, and is provided with two tubes. The mixture is then administered by means of the well-known apparatus invented by Clover. The quantity of gas expended amounts to about ten litres per minute; hence it would require a large supply for a long operation, which is a great drawback, as it involves the necessity of using balloons of some size, which would encumber the chamber of compressed air, the space in the interior of which is already rather limited. This drawback would render the application of the process most difficult in the great operations, as it would take up a great deal of space, and necessitate the employment of a certain number of assistants. Yet, notwithstanding these inconveniences, the new anæsthetic process will doubtless be used when and wherever practicable; and Drs. Léon Labbé and Péan, the former of the Lariboisière Hospital, and the latter of St. Louis, have resumed their experiments at their respective hospitals, which were interrupted by the summer holidays. During the last half of October, M. Labbé performed eight operations under the new process, and with perfect success. The operations, which were varied in their character, were performed in the movable bell or chamber of compressed air organized by Dr. Fontaine for medical as well as for surgical purposes. One operation—removal of a cancerous breast—lasted sixty-four minutes, without any injurious influence on the patient; and this would lead to the hope that the larger operations—even ovariotomy—may also be performed without any danger. The following are the advantages of the new process: uniform dosage of the anæsthetic agent; suppression of the stage of excitement during the operation, and of vomiting after it; rapid return of sensibility, etc. MM. Labbé and Péan have arranged to avail themselves of Dr. Fontaine's movable *cloche;* the former on Tuesdays, at the Lariboisière, and the latter on Thursdays at the St. Louis Hospital. Dr. Fontaine is the founder of the Aërotherapic Establishment in the Rue Chateaudun.—*British Med. Journal*, Dec. 6, 1879.

On the Hypnotic Value of Lactic Acid and Lactate of Soda.

Dr. DARIO MARAGLIANO publishes the results of a series of observations on this subject in the *Rivista Sperimentale di Freniatria e di Medicina Legale*, anno v, fasc. 3, 1879. The patients experimented upon were mostly quiet melancholiacs with obstinate insomnia. The acid was tried forty-nine times, and the salt twenty-six times. In twenty-five cases, lactic acid was given by the mouth in quantities of from one and a half to three drachms, with water and syrup; in none of these was there any beneficial effect. In sixteen cases, from one and three-quarters to two and a half drachms were given in the same way about an hour before supper; in only two of these (dose, one and three-quarter drachms), was the drug inert; in the other fourteen cases the patients went to sleep directly after going to bed, and slept until the morning. In eight cases, from two to three drachms of the acid, dissolved in water, were administered as an enema, sometimes before and sometimes after supper, but without producing any beneficial result. Lactate of soda (from two to four drachms, in six ounces of water, in divided doses), given in twelve cases after supper, produced no lasting sleep.

From two to two and a half drachms given before supper in four cases, gave equally uncertain results. Sound and lasting sleep was caused in four cases in which three or four drachms of the salt were given by the mouth an hour before supper, and consequently upon an empty stomach. The same quantity administered, *per rectum*, in six cases, caused no sleep whether given before or after supper. Both the acid and the salt were tried in three cases suffering from constant excitement and restlessness; they were administered under the most favourable conditions as indicated by the results given above, but produced no effect whatever; later on, one centigramme of morphia was added to the usual dose, but equally without result; two centigrammes of morphia, injected subcutaneously, in two of these cases, gave good results. The author's conclusions are these: 1. Lactic acid, in doses of two to two and a half drachms, and lactate of soda, in doses of three to four drachms, given to quiet lunatics by the mouth, on an empty stomach, three or four hours before bedtime, are efficacious in producing sleep. 2. These drugs have no effect when the insomnia is accompanied by great agitation and excitement. 3. Lactic acid and small doses of morphia, when administered together, do not mutually enhance one another's effects as has been stated to be sometimes the case. 4. The use of lactic acid and its salts as hypnotics for quiet lunatics is not to be preferred to that of those commonly employed at present (*e. g.*, chloral and morphia), on account of the following disadvantages: tardy action, the gastro-enteric disturbances which they produce, and their greater costliness. Dr. Maragliano's experiences in the use of these drugs quite confirm previous observations as to their very harmful effects upon the alimentary system. —*London Med. Record*, Dec. 15, 1879.

On a Combination of Chloride of Ammonium with Iron.

Professor T. GRAINGER STEWART (*Practitioner*, August, 1879) in drawing attention to a certain condition which often arises in cardiac affections (particularly aortic disease), demanding for its treatment large doses of iron, states that, in some cases, both belonging to the above groups and of other kinds, the reception of iron by the system is greatly facilitated if chloride of ammonium be administered along with it. The form of iron he finds best is the tincture of the perchloride; to this he adds chloride of ammonium, in doses of half a grain to each minim. He maintains that in cases in which iron, if given alone, causes dyspepsia, the latter is relieved by the combination described, and the patient is enabled to bear large doses of iron for a considerable time.—*London Med. Record*, Dec. 15, 1879.

Intravenous Injection of Milk and of Sugar.

In a paper, giving to the Société de Biologie (*Gaz. Med.*, Dec. 6) an account of a series of experiments which they have undertaken, Drs. Moutard-Martin and Charles Richet arrive at the following conclusions: 1. Injection of a large quantity of milk kills by bulbar anæmia. 2. The introduction of the lactic ferment into the veins of an animal seems to produce no effect. 3. Injection of concentrated solutions of sugar kills by bulbar anæmia. 4. Milk injected into the vascular system produces no immediate action, either on the pulmonary circulation, on muscular contractility, or on the vitality of the cerebral nervous centres or the nerves. 5. Sugar injected into the veins is rapidly excreted by the urine, and induces an intense polyuria and an abundant intestinal secretion. 6. The symptoms ensuing on large injections of milk are vomiting, polyuria, movements of deglutition, and later, sharp cries, disturbance of the respiratory innervation, contraction of the muscles of the limbs, and arrest of the action of the heart. 7. At the autopsies of animals killed by the injection of milk or sugar, there is found very marked intestinal injection, and subendocardiac ecchymoses are of *constant* occurrence. 8. In a therapeutical point of view the injection of milk is a useless and dangerous operation, and one which should be absolutely proscribed.—*Med. Times and Gazette*, Dec. 13, 1879.

—

On Menthol as an Antineuralgic.

Mr. A. D. **Macdonald** extols the virtues of this substance, which is a volatile solid obtained from Chinese or American oil of peppermint, as a remedy in the various forms of neuralgia. The solution he uses is the following: Menthol gr. j; spt. vini rect. ♏j; olei caryoph. ♏x; mix. To be shaken and painted over the affected tract. Pain is in this way relieved in from two to four minutes, and within a minute or two more the attack ceases. In toothache, the author has cleaned out the cavity of the tooth with a little cotton-wool, and then placed a single crystal on another small piece of wool and inserted it, with the result that the pain instantly disappeared. A tincture of the strength 1 in 50 is equally effective. Mr. Macdonald recommends menthol as a suitable external application in sciatica, intercostal neuralgia, and brachialgia.—*London Med. Record*, Dec. 15, 1879.

—

Vaseline in Gynæcological Practice.

Dr. **Sinety**, in *Le Progrès Méd.*, Nov. 29, calls attention to the value of this substance, in place of fatty substances, glycerine, soap, etc., for facilitating the introduction of the finger, speculum, or other instruments, and as an excipient for medicinal substances when applied to the os uteri. In place of using simple vaseline he prefers combining it with carbolic acid (one part to fifty of vaseline No. 1) in order to obtain disinfective properties when applying it to the finger, instruments, etc. Medicinally, iodine, iodide of potassium, belladonna, etc., may be applied by its agency.—*Med. Times and Gazette*, Dec. 6, 1879.

Medicine.

On the Treatment of Typhoid Fever.

The following address on the treatment of typhoid fever was delivered by Sir **William Jenner** before the Midland Medical Society at Birmingham, and is an able and elaborate statement from one who is recognized as the highest living authority in Great Britain on the subject of which it treats.

After acknowledging the honour of the invitation to address the Society, Sir William Jenner said:—

Though I have nothing new on the matter to bring before you this evening, and have therefore in some measure to pray your pardon for occupying so much of your valuable time in the enumeration of common truth, I still think myselt justified in selecting the Treatment of Typhoid Fever for my paper to-night—(1) because of the intrinsic importance of the subject; (2) because some of the questions concerning the treatment of typhoid fever are considered by many to be still undecided; (3) because not only have I had, for a longer period, probably, than any of my hearers, much experience in the treatment of the disease, but I have also had during later years frequent opportunities of myself seeing the results of various modes of treatment as practised by others; (4) because, although

I have written much and often on the etiology and pathology of the disease, I have never publicly expressed any opinion or written a line on its treatment.

In so complex a disease as typhoid fever—the mortality and symptoms of which vary not only with the age, habits, and family constitution of the patients, but also with the dose and mode of access to the system of the poison, the conditions which precede and those which accompany the disease during its incubative period and its earliest development, the epidemic constitution, the date at which the disease is first treated, and the early management of the patient; it is scarcely possible to find two cases in all respects identical, and quite impossible to collect records of a sufficient number of cases practically identical to determine by numerical analysis the best mode of treatment. And even of the specially prominent symptoms—*e. g.*, temperature, rapidity of pulse, diarrhœa—each one may owe its origin to such different pathological conditions, and it is so often impossible to determine in any given case to which of these several conditions it is due, that in the *present state* of pathological knowledge it seems to me that it is impracticable to determine otherwise than by the opinions formed by individuals from personal experience, what are the best means to be employed in the treatment, not only of typhoid fever itself, but also of each symptom, and how and under what circumstances each remedy should be employed. I do not in the least degree under-estimate the immense importance of numerical analysis for arriving at truth on medical subjects; and if it were possible to find the value of the several remedies proposed for the treatment of typhoid fever, or of its symptoms, by numerical analysis, the results of such an analysis would be real steps in our knowledge, for facts would replace opinions, and doubts in regard to the influence of remedies be impossible. Each special act of treatment would then be based on firm grounds, instead of being, as it now is, an experiment performed by the medical attendant. The sum of his own experiments constitutes each man's experience, to which, in proof of the correctness of his practice, he appeals as to a judge whose decision is final and infallible. And yet how different are the conclusions, all based on experience, drawn by different observers in regard to the effects on any given disease or symptom of any given remedy. The physician orders a drug or a stimulant, or employs a bath; and then, according to the credulous or sceptical tendency of his mind, his experience in the special disease he is treating, his knowledge of its natural course and history, his powers of observation, and the general soundness of his judgment, the *post hoc* is, in his opinion, a mere *post hoc*, or a veritable *propter hoc;* and the remedies he employed have been, in his opinion, of little consequence, or all-important; and so he builds up his experience on treatment. And the difficulty of building up treatment by the accumulation of the experience of many men, expressed in their opinions merely, is enhanced by the fact that, even when the conclusion is correct, the good effect following the administration of the drug is a veritable *propter hoc ;* it is for many men an impossibility to follow or define for themselves, much more describe to others, the several steps, in the mental analysis of the facts before them, they have performed in arriving at their correct conclusion. Some men appear to be capable of performing this delicate mental analysis correctly without being able to follow the steps of the analysis in their own minds; they are no more capable of following their own mental efforts, or of telling another how they arrived at their correct conclusion, than are those children who solve complex arithmetical problems in a few seconds without themselves knowing by what steps they pass from the premises to the conclusion.

Believing, however, notwithstanding all these sources of serious error, that in the present state of pathological knowledge it is impossible to fix the treatment of typhoid fever on a more sure basis than individual opinions founded on experience, I propose to describe what my experience has taught me to be the most successful methods of treatment of the disease, and also of some of the symptoms which by the severity they may attain cause grave discomfort to the patient, or place his life in danger. I shall limit myself to those symptoms which may be considered to be the natural manifestations of the disease, for time will not permit me to pass even briefly in review all the symptoms common in the disease or the complications, although the patient often succumbs to these symptoms and to these complications.

To give a clear view of the treatment of these symptoms, I shall be obliged to refer to the pathological conditions in which they severally originate.

I have never known a case of typhoid fever cut short by any remedial agent—that is cured. The poison which produces any one of the acute specific diseases (to which order typhoid fever as much as smallpox belongs) having entered the system, all the stages of the disease must, so far as we know, be passed through before the recipient of the poison can be well. If the patient can be kept alive for a definite time the specific disease ends, and then, if no local lesion remains to constitute a substantive disease, the patient is well. The treatment of typhoid fever is essentially rational. To treat a case with the best possible prospect of success the physician ought to be acquainted with the epidemic constitution of the period, the etiology of the disease, its mode of attack, its natural course, the order of appearance, and the natural duration of each of its symptoms, the way in which each symptom influences the termination, the several pathological lesions which produce or may produce each special symptom, and the complications to be watched for at each stage of the disease.

Certain facts have to be kept in mind when treating a case of typhoid fever, and when estimating the effect of remedies: First, that the disease, in the majority of cases at least, is produced by the action of a small portion of the excreta from the bowel of a person suffering from typhoid fever; that air from a drain, or air blowing over dried feculent matter, may convey the poison to the patient, or his own fingers may carry it to his mouth, or that the vehicle for the poison may be a fluid—for example, water or milk; and that the poisonous properties of the excreta may be destroyed by boiling the fluid in which they are contained, though not by filtering the fluid. Secondly, that the natural duration of a well-developed case of typhoid fever is from twenty-eight to thirty days. Hence subsidence of the fever before that date should be regarded with suspicion, and the patient not treated as if the specific disease had ended, while the continuance of febrile disturbance after that date should lead to repeated and most careful examination of the patient, in order to ascertain if any local lesion is keeping up the febrile excitement. But not only is the duration of the specific disease limited, but the prominent symptoms have their regular order of sequence, and several their own natural limits of duration—that is, a time to begin and a time to end; and the natural termination of a symptom has often been attributed to the remedial agent last employed.

On what part of the system the poison exerts its earliest influence, whether on the agminated glands or on the nervous system through the blood, must in the present state of our knowledge be doubtful; but that by the time the first symptoms of the disease occur the nervous system and the agminated glands of the small intestine are both seriously affected there can be no question. That the nervous system suffers at the outset is shown by the headache and the general nutritive disturbance—*i. e.*, by elevation of temperature and loss of weight, due to waste of the tissues generally, and by the arrested or disturbed secretions generally; and that the agminated glands also suffer from the outset is shown by the pain in the abdomen and deranged action and secretion of the bowels, and also by rare post-mortem examination made within a few days of the beginning of illness.

In the earliest stage of typhoid fever the patient is prone to commit certain mistakes in treating himself, either of which may add greatly to the severity of the coming illness. (1) He may think that he has a common cold in his limbs, as it is called, and try to throw it off by strong exercise. A certain sense of weakness accompanies this early stage of the fever, but it is rarely so great as to prevent the patient, if stimulated by strong will, walking long and briskly. (2) He may consider that he is suffering from biliary derangement, and attribute to this the headache, disturbed nights, sense of malaise, want of appetite, and disordered bowels, and take a dose of drastic aperient. (3) He may think the weakness he feels is to be removed by food and wine. A dose of medicine, he says, cannot hurt; bed, he thinks, weakens; and food and wine, he knows, restore strength; therefore he prescribes a dose for himself which irreparably injures his bowel; he takes exercise which increases the waste material in his system, and he loads his stomach with food it cannot digest and stimulants which heighten the fever and disturb the action of the eliminating organs, and then pays the penalty, perhaps with his life, for the errors his ignorance has led him to commit.

The thermometer saves, or ought to save, the physician from the patient's mistakes. The temperature having rendered it even *possible* that the ill-defined and may be trifling symptoms are due to the poison of typhoid fever, the patient should be absolutely confined to bed. Exercise or fatigue immediately before or after the absorption of the poison, and especially when the action of the poison is manifesting itself, increases the gravity of the disease, partly by exhausting the nervous power, but chiefly, I think, by causing destruction of tissue, and so the presence of waste material in the system on which the poison can act; and at the same time, by disturbing the action of the eliminating organs, it leads to the retention in the system of the products of the destroyed tissue.

Some of the worst cases of typhoid fever I have ever seen have appeared to me to owe their gravity to the patient having travelled, after the commencement of the sense of illness, in order to reach home. I very rarely advise a patient's removal to his home, if that be distant, so satisfied am I that the fatigue of travel, whether by rail or carriage, tends to make what would otherwise have proved a mild case severe, and to cause a bad case, which might after perhaps a struggle have ended favourably, to terminate in death. Not only is other tissue-destruction than that due to the fever process in a great degree prevented by rest in bed, but the nervous system is there less liable to disturbance, any tendency to moisture of skin is favoured, the elimination of the products of waste tissue is unchecked, and chances of error in diet diminished. The air of the room should be as pure as possible; the room in which the patient is placed be large enough to permit it being freely ventilated without draughts; if possible, the patient should occupy a different room at night from that used in the day.

From the first the patient should be restricted to liquid diet, with farinaceous food, and bread in some form if the appetite requires it. It is better to vary the broths, and to add to them some strong essence of vegetables. Sometimes a little strained fruit juice is taken with advantage, but skins and seeds of fruits and particles of the pulp are frequent sources of irritation of the bowel. Grapes are always dangerous from the difficulty of preventing the seeds slipping down the throat. The value of milk as an article of diet in fever is generally admitted, but it requires to be given with caution. The indiscriminate employment of milk in almost unlimited quantities as diet in fever has led to serious troubles. Milk contains a large amount of solid animal food. The casein of the milk has to pass into a solid form before digestion can take place. Curds form in the stomach, and, the digestive powers being weakened in fever, these curds may remain unchanged in the stomach, and produce considerable disturbance of system.

I have seen the patient restless, sleepless or drowsy, his temperature raised several degrees above what it had previously been, vomit, eject a quantity of curd, and at once the restlessness cease, the temperature fall, the skin became moist, and the patient drop into a quiet sleep. All the threatening symptoms vanish with the ejection of the offending material. Or the undigested curds may accumulate in the bowel, inducing flatulent distension and pain in the abdomen, restlessness, and increased febrile disturbance. Under these circumstances, I have seen an enema of thin gruel bring away a large vesselful of offensive, sour, undigested curds. Or, again, the undigested curds may themselves (and this has not been an uncommon consequence of milk diet in my experience) irritate the bowels, and produce, keep up, or greatly increase diarrhœa. A distinguished chemist once remarked to me, "Do not forget that a pint of milk contains as much solid animal matter as a full-sized mutton-chop;" and solid the casein of the milk must become before it can be digested; and yet I have known a patient drink two quarts and even more of milk in twenty-four hours—*i. e.*, solid animal food equal to four mutton-chops. Can anything approaching to such an amount of solid animal food be digested, and, if it could, is such an amount of animal food good for a patient suffering from typhoid fever? He is weak because of the presence of the fever, and not from lack of food.

Patients suffering from typhoid fever should be allowed an unlimited supply of pure water. When pure water is freely absorbed, it passes away by the kidneys, skin, lungs, etc., and is of much service as a depurating agent. If it be *possible*, even, that the poison of the fever was conveyed into the patient by the drinking-water or the milk of the district in which he is ill, then these fluids should be boiled till a different supply is obtained. All sources of foul air from drains or cesspools should be sought for, and the air the patient breathes be freed from all possibility of impurity; disinfectants should be placed in the close-stool, and the dejecta buried if possible. If the bowels are confined in the early stage of the disease a simple enema should be given. Hard stool retained in the bowel will produce irritation, and it may be catarrhal inflammation of the intestinal mucous membrane, and so induce troublesome diarrhœa. Small doses of mineral acid, well diluted, are grateful to the patient, and may perhaps be useful.

The fever is thus met by rest, quiet, fresh air, mixed liquid food and bland diluents, and the exclusion of fresh doses of poison; the intestinal lesion by the careful exclusion from the diet of all hard and irritating substances, and the removal from the bowel of any local irritant.

Frontal headache and sleeplessness are two symptoms of the early stages of typhoid fever which may cause the patient much distress. The headache is in some cases alleviated by cold and in others by warm applications; but as the headache ceases spontaneously in about ten days from the outset of the fever, no active treatment is required for its cure. Local applications, the exclusion of light from the room, and absolute quiet, have been all the means I have seen necessary for its relief. Sleeplessness is a more important symptom, for although it also usually disappears or diminishes spontaneously during the second week of disease, still this is not invariably the case; and the nervous system may be greatly worn by the want of sleep, lasting as it does occasionally, unless treated, night and day. The drugs I employ when, from the continued sleeplessness, it seems absolutely necessary to relieve it, are henbane, bromide of potassium, and chloral. From a combination of the latter I have seen very good results, and, so far as my experience has gone, no really ill effects when its use has been limited to the earlier stages of the disease—*i. e.*, to the period anterior to signs of nervous prostration. If the patient's temperature be high, a tepid bath or sponging the surface will often at once induce sleep, and no drug be required. In the earlier and also in the later stages of typhoid fever the sleeplessness has been treated by opiates. Experience has convinced me that although, in some cases, opium in sufficient dose to secure sleep has afforded relief, it is on the whole a most dangerous remedy. In the early stage of fever it disturbs digestion and checks secretion. In the later stages of the disease I have seen several cases fatal from its influence on brain, heart, and secreting organs. To my mind, the hoped for and occasionally attained good is altogether outweighed by the disproportionately possible evil and occasionally fatal effect resulting from the administration of direct sedatives, opium and chloral, in the later stages of fever.

Changes in the agminated glands are present from the earliest period of the disease, and to these progressing changes in Peyer's patches, in the mesenteric glands corresponding to the patches, and to the disturbances in the intestinal secretion and action consequent on these changes, the abdominal pains and laxness of bowels proper to the fever are due. So long as disease is limited to the specific changes in question there is probably little diarrhœa, but as local disease progresses catarrhal inflammation of the mucous membrane supervenes, and when this is extensive the stools become frequent, liquid, and more or less copious.

The changes preceding the ulceration, and the ulceration itself, of Peyer's patches are specific in nature, as much so as is the eruption on the skin; and there are no drugs or other means of arresting or limiting these specific processes. But over the diarrhœa which usually accompanies these processes in their progress we can, in many cases, exercise a decided influence.

The chief causes of diarrhœa in excess of that due to the intestinal specific changes in typhoid fever are: 1. Error in diet—*e. g.*, the use of solid food; the presence of particles of undigested food in the bowel, the abuse of milk, pure animal broths. My own experience has not satisfied me that one animal broth is more prone to produce diarrhœa than another. Excess of fluid, when there is inability to absorb the quantity drunk, passes through the bowel, and so simulates excessive secretion from the intestinal mucous membrane. 2. Catarrhal inflammation of the mucous membrane and irritability of the bowel. These conditions are frequently the consequence of, or are greatly increased by, the unhealthy intestinal secretions and contents, evidenced by their ammoniacal and especially offensive odour and strong alkaline reaction, and by the passage through the bowel of undigested food, whether liquid or solid. So long as the stools do not exceed three to five of moderate quantity in twenty-four hours, the looseness of bowels is rather advantageous than injurious; but when, from their number or from their quantity, there is risk of the strength of the patient being reduced to a dangerous degree, then it becomes necessary to restrain the diarrhœa. The treatment varies with the pathological condition which induces the diarrhœa. It is often sufficient to examine the stools to detect the cause and remove it—*e. g.*, curds of milk. Inquiry may prove the great excess of the fluid taken into the stomach over that passed by kidneys and skin. When the stools are strongly alkaline diluted sulphuric acid sometimes affords marked relief. When the stools are merely frequent four ounces of starch water thrown into the rectum night and morning will often check the frequent action. Should this not prove efficacious from three to ten drops of laudanum in one ounce and a half of starch water may be thrown into the bowel night and morning *after* the passage of the stool. When very offensive, correctives of fetor should be given; a teaspoonful of charcoal may be given two or three times a day. Under its influence I have seen the stools lose their fetor and ammoniacal odour, become less liquid, and in many cases the irritation from the catarrhal inflammation of the mucous membrane diminished. The greatest possible care should be taken that the charcoal is an impalpable powder; animal charcoal has, in this respect, some advantages over vegetable. Other correctives of fetor, or antiseptics, will have as good effect as charcoal, but this has given me such satisfactory results that I have not resorted to other remedies of its class.

Carbonate of bismuth, in twenty-grain doses every four or six hours, is one of the best remedies I know for the catarrhal inflammation of the bowel itself. If the fluid poured out be very excessive, then a vegetable astringent, as catechu and kino, may be given with the bismuth, and, should these means fail, three to five drops of laudanum must be added to each dose of the mixture. The use of opium, even in this dose, by the mouth, should be avoided if possible, as, by interfering with the action of excreting organs, and by its other effects on the nervous system, it may do more harm than the symptom for which it is prescribed. The administration of opium should if possible be limited to the bowel.

In place of being relaxed, the bowels are occasionally confined. Inaction of the bowels in typhoid fever may be due to torpidity of the large bowel, with free absorption of the fluid contents or diminished secretion of fluid by the mucous membrane of the bowel. Under these conditions the stools become even hard and dry, and, if long retained in the bowel, may produce considerable irritation, and even catarrhal inflammation, of the mucous membrane of the bowel, with diarrhœa.

At the same time that solid stool accumulates in the rectum and colon, which may require removal, there may be extensive or deep ulceration in the ileum. A small-sized enema of thin gruel, repeated every other day if necessary, is safer than a large enema at longer intervals. Laxatives, however mild, by the mouth, are liable to irritate the ulcerated surface of the bowel, and, if sloughs are separating, may forcibly hasten the detachment, and so produce hemorrhage and turn the scale between recovery and death.

The most important, and a not unfrequent, cause of inaction of the bowel in typhoid fever is *deep* ulceration of one or more Peyer's patches. Large superficial ulcers favour the occurrence of diarrhœa, and are often accompanied by catarrhal inflammation of the mucous membrane. A single *deep* ulcer will paralyze the action of the bowel, and so cause constipation, and this has to be kept in mind as a fact of the highest practical importance when it is proposed to relieve the bowels by an aperient. A deep ulcer is usually produced by the separation of a deep slough, and is often unattended by any catarrhal inflammation of the small intestine, or by any affection of the large intestine.

In all cases of typhoid fever there is some distension by flatus of the abdomen—the belly is more or less blown. The distension is sometimes so great as to interfere with the free play of the diaphragm, and so, by preventing the full expansion of the lungs, favour congestion of those organs and impede the circulation. Fluid will run through the bowels with little effort; air requires expulsion. Excess of flatus in the bowels may have its origin in deficient power of expulsion or excessive generation of gas. Sufficient paralysis of the bowel to cause accumulation of flatus may be the result of loss of nerve energy, or of local injury of the bowel. A single *deep* slough-formed ulcer will paralyze the action of the bowel, and lead to such an accumulation of flatus as produces enormous distension of the abdomen; the weaker the abdominal muscles the greater, *cæteris paribus*, the accumulation of flatus. Want of power to expel the flatus, and excess in the quantity formed, reach their maximum as a rule about the latter half of the third and during the fourth week of the fever, for then the sloughing and ulcerative processes of the walls of the intestine are at their height, the nerve-power is at its lowest, and the contractile energy of the abdominal and intestinal muscles is consequently at its minimum; while, from the state of the stomach and the secreting glands generally, the antiseptic digestive processes are in a great degree arrested, and the food that finds its way into the intestines mingling with the fetid secretions from the diseased intestines, and with the sloughing particles separating from the solitary and agminated glands and from the floors of the ulcers, readily undergo gas-generating decomposition. Of all the remedies proposed for the relief of flatulent distension of the abdomen, turpentine applied externally is the most extensively employed in practice. Now I must say, with reference to the external application of turpentine, that I have never seen a diminution of the distension which seemed to me to be *propter hoc.*

The brief outline I have sketched of the pathological conditions causing the distension gives the key to what has seemed to me to be its most successful treatment. If the stools be fetid and the distension is in part due at least to the excess in the gas formed, then to destroy this fetor and to arrest putrefaction and gas-generating decay of the contents of the intestine is for me the first object. Charcoal has proved a most efficient agent for effecting this purpose. It is of importance to select as food substance which leaves no solid residue to undergo decomposition in the intestine. The administration of pepsin and acid at the same time as the food, and also the partial digestion of the food before it is taken, is often advantageous. The large intestine is occasionally so greatly distended as to lose from stretching its contractile power; the introduction of a long tube into the bowel, and the mechanical removal of some of the gas, will occasionally be sufficient to enable the bowel to regain some of its contractile power. Alcohol in fit doses improves the nerve-energy, and so increases temporarily the muscular power of the intestinal and abdominal walls.

(Conclusion in next Number.)

On Epileptiform Syphilis.

Dr. CELSO PELLIZZARI details (*Lo Sperimentale*) the particulars of three fatal cases of cerebral disease, accompanied by convulsive attacks, in syphilitic subjects, which occurred in the hospital at Florence. Case I.—A man, aged 38, was admitted on account of convulsions, which had recurred more or less frequently during several days. There was a history of syphilis sixteen years before, and the man bore marks of old syphilitic sores about his body. He married five years after having contracted syphilis, and became the father of five sons, who died soon after birth. A sixth son was still living. There was no family history of epilepsy, and the first convulsive attack had occurred about ten months before the patient came under observation. On admission, the convulsions were confined to the left side of the body, and recurred almost every ten minutes, but soon became more general and with less interval between the attacks. Unconsciousness gradually supervened, and the man died two days after admission. The case on admission had been recognized as a syphilitic one, and mercurial inunction, with iodide of potassium internally, had been at once prescribed. *Post mortem*, there was found firm adhesions of the membranes to the right frontal lobe of the brain, over an area about the size of a five-franc piece. At this spot also the cortex of the brain was to a great extent destroyed, and its place taken by well-organized connective tissue. There were bony formations on the internal surface of the cranium, and also in the meninges; and gummy nodules of both testicles. Case II.—A boy, aged 8, born of syphilitic parents, who had himself been under treatment at various times for congenital syphilis, was suddenly seized during the night with a convulsive attack of very short duration. Next morning another fit occurred, involving only the left side of the body. In a third attack, the child fell down in the street. There was no family history of epilepsy. Other attacks occurred from time to time, and the child was brought to the hospital. After admission, under mercurial inunction and iodide of potassium internally, great improvement took place; the fits became much less frequent, and the child began to walk about the ward. All was apparently going on well, when the patient was attacked suddenly by typhoid fever, and died in about three weeks. *Post mortem*, the skull and dura mater were found quite healthy, as was also the pia mater, except the right parietal region, where it was a little thickened and opaque. There was slight wasting of the brain-substance. No gummata nor tubercles were found. At the upper part of the right lung was a circumscribed patch of pneumonia surrounding a cicatrix, which seemed to be that of a bygone gumma. The liver presented a deepish cicatrix on its convex surface. In the intestines, clear evidence of typhoid was found. The author relates a third fatal case in which convulsions, beginning unilaterally, were probably due to syphilis. He also refers to the writings of most of those who have written on brain syphilis of late years, and discusses at considerable length the etiology, diagnosis, prognosis, and treatment of cerebral syphilis, attended by epileptiform seizures.—*London Med. Record*, Dec. 15, 1879.

On Syphilitic Myositis.

The following case occurred in the service of M. DUPLAY (*Archives Gén. de Méd.*, 1879, p. 731): A man had an abscess in the axilla, supposed to have been caused by the use of a centre-bit in his work. The abscess broke, and much pus escaped. There was no lesion of any of the fingers. The wound gradually ceased to discharge, and was going on well when, three weeks after the opening of the abscess, redness appeared over the whole pectoralis major, together with slight œdema and pain on trying to separate the arm from the side. The pectoralis major subsequently became as hard as wood, and the arm could not be moved. M. Humbert, who had charge of the patient, diagnosed suppuration, and passed a drainage-tube through the muscle, but with no good effect. The history of the patient was then inquired into, and syphilis was found to have been contracted four years previously. Under specific treatment all the inflammatory symptoms as well as the hardness quite disappeared, but the muscle became atrophied.—*London Med. Record*, Dec. 15, 1879.

Salicylic Acid in the Treatment of Diabetes.

Dr. SCHAETZKE, publishes in the *Berliner Klin. Wochenschrift* for June 2, 1879, the history of three cases of diabetes successfully treated by salicylic acid. The first case was that of a lady aged 50, who had for eighteen months been under treatment for chronic gastric catarrh. Her father, sister, and husband had died of tuberculosis. When she was seen by the author, he at once suspected diabetes from the excessive thirst, polyuria, caries of the teeth, etc. The urine was examined, and found to contain sugar; the specific gravity was 1038. The patient was treated with salicylic acid, 3 *grammes* (45½ grains) being ordered to be taken three times daily for three days. On the first day, however, she felt giddy and had nausea. On the second day, she vomited once; her hearing was affected, and her gait became unsteady. The dose was, therefore, reduced from nine *grammes* daily to three *grammes*. Owing to her intolerance of salicylic acid, Herr Schaetzke sent her to Carlsbad. Upon her arrival there, the urine was found to be perfectly free from sugar, and remained thus both during her cure and afterwards. The second case was that of a man aged 58, who probably had been suffering from diabetes for the last two years. The urine contained a considerable percentage of sugar. As the patient could not be prevailed upon to go to Carlsbad, he drank the waters at home, but without much benefit. Herr Schaetzke then again resolved to try the salicylic acid treatment, beginning, as in the first case, with three *grammes* three times a day. The patient also evinced great intolerance of the drug. It was, however, continued for two weeks, in doses of three *grammes* daily during the first week and two *grammes* during the second week, when the sugar disappeared from the urine and did not reappear. The other case was that of a girl aged 26, who had been suffering from colic for years. She was treated in the same way as the two other patients, but was obliged to discontinue the treatment after the first four days, owing to her intolerance of the drug. A week later, another attempt was made with a dose of two *grammes* daily; this was continued for a fortnight, when the urine remained free from sugar. It is curious that in every one of these cases the patient should have been so intolerant of the salicylic acid. Could this phenomenon be in any way connected with their disease? and, if so, in what way? A series of three cases can hardly be regarded as sufficient for establishing the reputation of salicylic acid as a cure for diabetes; but the subject is worthy of being more thoroughly investigated.—*Brit. Med. Journ.*, Oct. 11, 1879.

Cortical Paralysis of the Arm.

At a recent meeting (Nov. 11, 1879) of the Paris Académie de Médecine, a paper was read by M. GASTON DECAISNE, containing the history of thirty-six cases of brachial monoplegia, of which several came under his own observation. His conclusions point to the fact that there exists in each cerebral hemisphere a centre which regulates the motor power of the upper limb of the opposite side; that this centre, which is more extended than has hitherto been generally supposed, comprises not only the ascending frontal and parietal, but also a smaller or greater portion of the adjacent frontal and parietal convolutions. M. Decaisne believes that, in consequence of the large surface of the motor centre, the re-establishment of the motion may be effected by the aid of the cells in the vicinity of the lesion which have remained healthy. He also describes the peculiar characteristics of the paralysis in question very well, and his memoir will help to their being distinguished from those having a central origin, a diagnosis which is often very difficult at the bedside.—*Brit. Med. Journ.*, Dec. 13, 1879.

Bromide of Potassium in Pertussis.

Dr. KÖRNER, of Trebniss, writing in the *Berlin Klin. Woch.*, Nov. 7, says that he should not have repeated the recommendation of inhalation of the bromide, which he formerly published, had not a recent epidemic of wide extent given him ample reason for recurring to the subject. He treated all his cases in this by inhalation, effecting a cure in a proportionally short time. He employed a solution of from 2 to 5 per cent. (usually 4 or 5), about twenty grammes of which were inhaled three times a day. The effect was surprising. After the first inhalation decided improvement was observed, and in from three to five days the paroxysmal cough had ceased, and the expectoration had become easy. In a couple more days the pertussis usually had ceased. As a general rule, the children inhaled readily, and far more so than they would have taken medicines. He attributes the little repute this means has hitherto acquired to a mismanagement of the apparatus, and he advises the medical attendant to most carefully instruct the friends of the child in its use.—*Med. Times and Gazette*, Dec. 20, 1879.

Erysipelas of the Lung.

The doctrine of metastasis is not dead. If anything, it has risen again of late years into a position almost as high as that it occupied at the very dawn of medicine. Of all diseases in which this doctrine has been applied facial erysipelas stands foremost. Its acutely spreading nature, its frequently rapid subsidence, coinciding with grave constitutional or visceral complications, must always have laid it open to be so interpreted. Of all its complications, meningitis and pneumonia stand foremost. It is true that the supervention of each of these, with a fading cutaneous inflammation, might be accounted for by a continuity of inflammation along contiguous parts. But there is often no evidence of this, and "metastasis," the mysterious *Deus ex machinâ* of medicine, is held to be the cause of the rapid change in the locality of the inflammatory process. We all know how fond the "ancients" were of this explanation for many inscrutable facts of disease; we know how the laity of the present day cherish the same views, and even, it must be confessed, how the profession itself is compelled occasionally to adopt them.

A recent careful contribution to the subject—one more step attempted for the dispelling of metastasis—is furnished to the *Revue Mensuelle* for September by Dr. STRAUS. After a brief historical review, in which he points out the paucity of writings upon a form of pneumonia which could strictly be called erysipelatous, he relates the following case: A young journalist, twenty-six years of age, muscular and robust, neither addicted to alcohol nor the subject of syphilis, was attacked with facial erysipelas on March 10. He was admitted into the Menilmontant Hospital, under the care of Dr. Straus, on the 15th, by which time the eruption had extended all over the face and was invading the scalp. On the 17th defervescence began; the eruption ceased to spread; desquamation set in, but there was great prostration. Six days later he had pain in the right side of the chest, without any rigor, and cough without expectoration. On the 24th there was acute fever, sore throat, injection of tonsils and fauces, impaired resonance, and pneumonic crepitation at the base of the right lung. On the 25th the throat condition was worse, and the pneumonic signs had extended, and on the 27th he died.

It must be confessed that reading the case thus it seems most readily explained on the ground that he had been attacked with pneumonia during convalescence from erysipelas; that there was no direct causal relation between the latter and the former; that the supervention of the lung disease was a coincidence. But Dr. Straus does not think so. Clinically the insidious onset of the pneumonia, its rapid extension, and the absence of any other exciting cause, led him to think it depended on the erysipelas itself. He holds this to be borne out in a striking manner by the results of the *post-mortem* examination. The face was livid, not swollen. There was a thick, grayish coating to the tongue and palate; the pharyngeal mucous membrane was bright red—an appearance ceasing abruptly at the œsophagus. The right lung was hepatized throughout, the extreme apex alone being crepitant. All the rest of the organ presented a grayish but not very granular surface on section, studded with small reddish islets. The left lung was congested. The larynx was normal, but the tracheal mucous membrane, from the third or fourth rings downwards, was of a bright scarlet colour, contrasting markedly with the pallor of the laryngeal mucosa. Below, this vivid injection ceased at the level of the left bronchus, and did not occur in any of its divisions, but it continued throughout the right bronchus even to its smallest branches. There was no exudation. The redness was seen to be due to very fine vascular injection; it was much more intense than usually seen in pneumonic lungs, and was most marked opposite to the interannular spaces. Microscopical examination of the affected lung showed a notable absence of fibrinous moulds and filaments, as in ordinary croupous pneumonia; the alveoli were stuffed with leucocytes, mingled with swollen multinucleate epithelioid cells; and the trabeculæ and interlobular septa were also greatly infiltrated with inflammatory cells. The absence of fibrin was as marked in the red as in the gray parts of the hepatized lung.

All these characters point, the author thinks, to the pneumonia being peculiar, and produced by the direct extension of the erysipelatous inflammation along the respiratory tract—that, in fact, he had to deal with a true "erysipelas of the lung." The curious thing is that the laryngeal mucous membrane should have so wholly escaped, if this view be correct; for, in the first place, had it been attacked, it is likely that œdema of the glottis would have carried off the patient before the process could have reached the lungs, and, in the second place, its exemption would be strange indeed, and would cause one to fall back on the doctrine of metastasis, which the author has sought to avoid. A third hypothesis propounded by the author is that the larynx was affected in so transitory a manner that no trace of its involvement remained after death. This is conceivable; only opposed to it is the fact that there were no clinical phenomena to bear out the idea of any laryngeal trouble whatever. So, as to this case, it must be left undecided whether the pneumonia were a mere coincidence in the convalescence of facial erysipelas, whether it were an extension of the erysipelatous inflammation directly from the skin to the lungs, or its indirect conveyance through the medium of metastasis, the pulmonary inflammation occurring on the retrogression of the cutaneous. These are interesting speculations, open to further examination before it is finally concluded that there is such a disease as "erysipelas of the lung."—*Lancet*, Nov. 8, 1879.

On Operation for Empyema in an almost Moribund Patient, followed by Recovery.

M. MOUTARD-MARTIN (*Revue Médicale*, Nov. 1879) was called in to consult in the case of a little girl, aged 5, who eight days previously had been attacked with pleuro-pneumonia. He found the patient in a very serious condition. Her face and lips were blue, the cheeks pale, respiration incomplete and jerky, and the pulse was no longer perceptible. There was general anasarca, and the left side showed signs of effusion, filling the whole pleural cavity. It was doubtful whether any action should be taken, or whether it was not too late, and risk would be incurred of seeing the little patient succumb during the operation. M. Moutard-Martin, however, resolved to operate, and he performed paracentesis, which gave issue to a litre and a half of purulent liquid. The child did not die on the spot as was expected. Two days afterwards, as she had slightly improved, a very small quantity of pus was evacuated, because the cannula had become blocked up. On the third day all the unfavourable symptoms became aggravated; the spark of life which still remained seemed about to be extinguished, and complete asphyxia seemed imminent. One resource remained—the operation for empyema. The same serious difficulty now cropped up as in the first instance, but in accordance with the wishes of the family of the patient, M. Moutard-Martin wished to perform the operation for empyema, and incised the eighth intercostal space. The patient felt absolutely nothing, so far advanced was the asphyxia, and a tube was inserted into the pleura. The operation was followed by a veritable resurrection; the general condition improved and soon became quite satisfactory. The appetite returned, and increased to such an extent that the child could not be satisfied; the quantity of pus gradually but surely diminished, and M. Moutard-Martin gave up his patient in a state promising complete recovery. M. Féiéol has observed an analogous case in another child, who was diagnosed as being attacked with tuberculous meningitis, and who seemed *in extremis* An opening for empyema was about to occur spontaneously under the clavicle, when M. Féréol saw the patient. A purulent sac had been there formed which threatened to open speedily. M. Féiéol performed the regular empyema operation, and the child was saved.—*London Med. Record*, Dec. 15, 1879.

On Primary Suppurating Myocarditis.

M. FÉRÉOL reports (*Union Med.*, 1879, Nos. 27 and 28) the case of a cook, aged 44, who twelve years before had had intermittent fever, but had been otherwise healthy, until fourteen days before admission, when he was taken with sharp transient pains in the middle of the chest. On admission there were extreme dyspnœa, slight enlargement of the heart, very energetic cardiac action, without alteration of sounds, scarcely perceptible, but very rapid pulse, fine crepitant râles at the bases of the lungs posteriorly, no dulness, some bloody sputa. The heart-sounds became feebler, the stools dysenteric; œdema and cyanosis of the lower extremities set in, and the patient died on the 7th day. The necropsy showed slight enlargement of the left ventricle. In its muscular wall, near the slightly clouded or thickened endocardium, were numerous circumscribed abscesses with hemorrhagic peripherics about the size of a pin's head, most numerous at the apex, where the endocardium was covered with old clots, containing purulent masses in their centres. In the aorta there were fresh patches of endarteritis side by side with old atheroma. There was atheroma in other arteries, but not in the coronary arteries. There were no embola or infarcts. The lungs were hyperæmic; the spleen was not enlarged, its capsule was thickened. Microscopical examination showed purulent infiltration between the muscular fibrillæ around the abscesses, and a peculiar degeneration of the fibrillæ, which became bright shining, not staining with picrocarmine, and showing a double contour.—*London Med. Record*, Dec. 15, 1879.

On Aneurism of the Aorta in a Syphilitic Subject.

A man, aged 48, had aneurism of the aorta and a swelling on one tibia. Death occurred from the bursting of the aneurism opposite the head of the pancreas. Under antisyphilitic treatment the tibial swelling had diminished. The morbid specimens were shown by M. VALLIN, at the Société Médicale des Hôpitaux (*L'Union Med.*, June 19, p. 24, 1879), and gave rise to a discussion on the relation between syphilis and aneurism. M. Fournier considered it demonstrated beyond doubt that aneurism might result from syphilis, not strictly as a syphilitic lesion, but as a consequence of lesion of the walls of the vessel developed by syphilis. Syphilis ought assuredly to take a place in the etiology of aneurism, but in what proportion of cases was not yet known. The non-success of remedies was no argument against this view, because aneurism, once formed, was an accomplished lesion, just as was a perforation of the palate, upon which we could not expect medicines to have any effect. M. Cornil said syphilis had a great deal to do with arteritis, but when an aneurism had once formed, specific treatment was powerless.—*London Med. Record*, Dec. 15, 1879.

On Local Temperatures in Diseases of the Abdomen.

Prof. PETER, in continuation of his investigations on morbid local temperatures (see *Monthly Abstract*, 1879, p. 443), communicated to the Académie de Médecine (*Gaz. Médicale*, Dec. 13) the first part of a paper "On Morbid Local Temperatures in Diseases of the Abdomen."

It results from these investigations that in ascites the temperature of the abdominal wall does not rise, but continues at about 35.5° Cent. (which is the normal mean, and sometimes even falls below this). Prof. Peter criticizes the language of those who give the name of ascites to the serous effusion of chronic peritonitis, this effusion being not dropsical, but inflammatory, as is demonstrated, amongst other circumstances, by the excess of fibrin which it contains. Contrary to what is observed in ascites—that is, dropsy of the peritoneum—*chronic phlegmasias of this membrane raise the temperature by one degree or more.* Prof. Peter gives as examples three cases of different types of chronic phlegmasia of the peritoneum —1. Simple chronic peritonitis radiating from a chronic phlegmasia of the stomach (sclerous gastritis); 2. Chronic tubercular peritonitis; 3. Chronic cancerous peritonitis. In the first case the local temperature of the abdominal wall was raised by 0.8°, when that of the axilla was lowered by 0.5° (the temperature of inanition)—so that the absolute local super-elevation amounted to 1.3°. In the tubercular peritonitis the super-elevation varied from 1° to 1.9°, and presented the remarkable peculiarity that, during the last hours of life, the axillary temperature was lowered by 2.5° (to 34.5°), the local temperature being still elevated 1° above the normal (36.5°) of the abdominal wall—exceeding absolutely that of the axilla by 2°, and being relatively greater by 3.5°; proving the existence of morbid thermogenous centres, the local temperature of which is so far independent of the general temperature that it may be superior to it. In cancerous peritonitis the local super-elevation varied from 0.8° to 2°. In a fourth case (of tubercular peritonitis, which was mistaken for a hysterical tympanites) the super-elevation varied from 1° to 1.5°, and was one day 0.4° higher than in the axilla.

Thus, in a clinical point of view, this super-elevation of local temperature in chronic peritonitis furnishes a new means of diagnosis between chronic peritonitis and ascites, in which the temperature remains normal. With respect to general physiology, ascites does not raise the normal temperature because it is a mere physical fact—the filtration of the serum of the blood through the distended walls of the veins; while chronic phlegmasia *always raises this local temperature*, because there is here a dynamic act, a process—the secretion of a fibrinous serosity. Whence it follows that, in pathology as in mechanics, whenever there is work accomplished there is caloric disengaged, which disengaged caloric, representing a process accomplished, may become a means of diagnosis of this process. This idea of morbid work done need not be confined to the secretion of an inflammatory morbid product, but may be extended to genesis of a neoplasm (tubercle or cancer), and to the evolution of this—the caloric disengaged on this occasion revealing the origin and the phases of the evolution of this neoplasm.

M. Hillairet observed that he had made some investigations on local temperatures in disease of the skin, but had abandoned them in consequence of the considerable differences he had observed in the results. He wished to know what thermometer Prof. Peter employed. In reply, Prof. Peter said that he used the ordinary thermometer, which always gave him very exact results. He regarded it as preferable to the discoid thermometers employed in England, which have the inconvenience of not being able to be applied in the intercostal spaces. There are other instruments of great precision, but of difficult employment. M. Noel Guéneau de Mussy spoke favourably of the thermometer employed by Dr. Seguin of New York.—*Med. Times and Gazette*, Dec. 20, 1879.

Diseases of the Stomach.

M. Leven, the chief physician to the Rothschild Hospital in Paris, in his recently published work (*Treatise on Diseases of the Stomach*), which is based on very extensive clinical researches, and on numerous physiological experiments, formulates some novel theories, which are of considerable importance, from the clinical and therapeutic points of view. With regard to the physiology of the stomach, for instance, M. Leven admits, and seeks to establish by his experiments, that the function of the stomach is much more mechanical than chemical. If the aliments be liquid, they are almost immediately driven by the contractions of the stomach as far as the intestines; if they be solid, they are simply then chymified; that is to say, transformed into a semiliquid mass, able to pass into the intestines, which is the true centre of digestion of nitrogenized elements like fecula and fats. Neither peptonization nor absorption takes place in the stomach. The function of the stomach is the same with regard to all kinds of food. With regard to the secretion of the intestine, M. Leven also postulates a totally new theory, since he believes that the intestinal juice has an acid reaction similar to that of the stomach, and not alkaline, as the physiologists assert. This difference is connected with the fact that in the experiments, which are destined to yield intestinal juice, purgatives are used, which bring on a very acute congestion of the mucous membrane, and consequently an exhalation, which is nothing else than the serum of the blood, with its alkaline reaction—a fluid analogous to that which would be obtained by a veritable traumatic irritation of that mucous membrane. From this way of looking at the physiology of the gastro-intestinal apparatus, there also arise great differences in the appreciation of the nature of the diseases of the stomach, and especially of dyspepsia, which includes them all. Dyspepsia, in fact, is no longer in any case a functional trouble, a neurosis of the stomach, but is characterized by congestion and inflammation of the mucous and underlying membranes, such inflammation being capable of producing degeneration of the mucous membrane, sclerosis of the septa of the vessels, and hypertrophy of the submucous cellular tissue. In so considering dyspepsia, gastralgia, which is mixed up with it, and is naught else than dyspepsia with painful crises, must not be dissevered from it. Ulceration is only an accident, a complication of chronic dyspepsia. Cancer itself may follow the same affection. Hereditary cancer, which comes on at once, alone presents a different origin, the result being that all diseases of the stomach, the last-named form of cancer excepted, are reduced to one morbid species, dyspepsia. It will be recognized that Dr. Leven's theory approximates greatly to that of Trousseau, who recognized the effect of a gastritis in every dyspepsia. The therapeutic conclusions are, however, absolutely different, for, according to him, the proper treatment of diseases of the stomach consists, above all things, in regimen and hygiene, medication only playing a secondary part. M. Leven also is absolutely opposed to the opinion of Trousseau, that dyspeptic patients are the best judges of the food which agrees with them, and which they can digest. He affirms, on the contrary, that it is extremely important that the medical attendant should direct the regimen of his patient, and superintend his mode of life. He therefore lays great stress on this part of therapeutics, as well as on the etiology of dyspepsia. In this portion of the book, which is evidently destined to give rise to much criticism, the practitioner will find many useful suggestions.—*London Med. Record*, Dec. 15, 1879.

On Diffuse Phlegmonous Gastritis.

Dellinger records (*Deut. Arch. f. Klin. Med.*, Bd. xxii.) the following case of diffuse phlegmonous gastritis: A pensioner, aged 53, a great brandy drinker, was taken ill three days previously with severe rigors, followed by fever (100.4 to 104.5 Fahr.), frequent vomiting and continual diarrhœa. The epigastrium was distended and very tender. After a few days there were great resistance in the gastric region; increasing loss of strength; delirium; some more rigors one day before death, which occurred on the eighth day. At the necropsy the wall of the stomach was found much thickened. The mucous surface along the fundus and the great curvature was perforated like a sieve by small losses of substance, out of which thick yellow pus could be squeezed. On section through other parts of the stomach, in some places diffuse purulent jelly-like infiltration, in other places submucous abscesses as large as hazel-nuts, were present. The chief part of the infiltration was between the mucosa and muscularis, but in many places involved the muscular and even the subserous tissue. Besides these lesions there were commencing liver cirrhosis and chronic gastric and intestinal catarrh. In some parts of the gastric peritoneum there were thin fibrinous false membranes. In respect to the diagnosis, he lays stress on (1) the fever and general symptoms; (2) the nature of the pain in the stomach, which, unlike peritonitis, was not increased by movements; (3) the increased resistance in the epigastrium. His second was one of gastritis phlegmonosa circumscripta. A woman, aged 32, was taken ill with rigor, fever, pain in the stomach, and vomiting. In the epigastrium, which was at first only painful on pressure, resistant, and distended, a tumour as large as a fist developed, which disappeared, after the patient at the twentieth day vomited up a quarter of a litre of bad smelling, yellowish-white blood-streaked pus, with a feeling as if something was torn in the stomach. Very rapid convalescence followed. The patient had complained of gastric pain a year before, so it is possible that there may have been an ulcer, which led to the formation of the abscess.—*London Med. Record*, Dec. 15, 1879.

Lesions of the Peritoneum in Drunkards.

Prof. **Leudet**, of Rouen (*Gaz. Hebdom.*, Dec. 5), read a paper on this subject at the recent Montpellier Congress, and arrived at the following conclusions: 1. Persons who abuse alcoholic drinks may become the subjects of ascites, which comes on without marked symptoms and without prior notable derangement of health. 2. Such ascites is susceptible of prolonged arrest, and perhaps even of a definite cure. 3. The chronic peritonitis of drinkers may come on slowly without any grave symptom. 4. It seems frequently to be the result of a slow irradiation of lesions of the digestive canal, such as gastric cirrhosis, with or without ulceration, or of enteritis. 5. Chronic peritonitis may induce inflammatory recrudescences of the peritoneum, general or partial effusions, or intra-peritoneal hemorrhage.—*Med. Times and Gazette*, Dec. 13, 1879.

Surgery.

Methods of Transfusion.

At a recent meeting of the Obstetrical Society of London (*Lancet*, Dec. 13, 1879) Mr. E. A. **Schafer**, F.R.S., presented a report of an experimental inquiry into the methods of transfusion. The first part of the inquiry was to ascertain whether any other fluid, such as milk, could with advantage be substituted for blood in transfusion. Numerous experiments were made on this point, with the co-operation of Mr. G. F. Dowdeswell. It was found that rabbits generally died within twenty-four hours if ordinary milk was injected into their veins, even in small quantities. The blood-corpuscles became disorganized, and the blood swarmed with bacteria. Milk which had just been boiled, or which had been drawn direct from the cow's teat into a previously superheated vessel, was innocuous. Dogs and cats resisted the action of septic organisms in milk. In animals reduced by bleeding to an almost lifeless condition, the injection of milk into the bloodvessels was sometimes, but not always, followed by temporary rise of blood-pressure, but there was never any permanently beneficial effect. Such animals always died. These results are confirmatory of those of Howe and Dupuy in America. It was next explained that no fluid lacking hæmoglobin could be expected to be of benefit in cases of acute anæmia.

The question next to be determined was whether the blood of any other animal could be used for transfusion in cases of depletion of the human subject. This question is answered in the negative by the results of the microscopical examination of mixtures of human blood with the blood of the lower animals. As Landois and others have already shown, sooner or later the red blood-corpuscles of one or of both kinds of blood become dissolved. Moreover, the white blood-corpuscles cease their amœboid movements, and are soon killed. Sometimes the solution of the colouring matter of the blood-corpuscles occurred in a few minutes, sometimes not for some hours. At any rate the action of the blood or serum of the lower animals is by these experiments proved to be an actual poison to the human blood-corpuscles, and would probably be the same to the living cells of the tissues. Moreover, it was found that dog's blood could not be transfused to any great extent into a cat in place of the animal's own blood, or lamb's blood into a dog, without fatal consequences. The result of these experiments, then, is to prove that *in man only human blood can be used with advantage for transfusion.*

It was next sought to determine the best method in which transfusion can be effected, and especially if it were possible to transfuse arterial blood into an artery towards the heart. The great advantage which such a method must present is pointed out by Blundell, who, in one passage in his "Researches," gives as a reason for recommending such a course that the circulation through the coronary arteries is at once renewed, and the heart thereby strengthened. Numerous experiments were accordingly made upon dogs and cats with the object of testing the result of such a mode of transfusion and its applicability to the human subject. In these experiments an animal was first depleted of blood until arterial pressure had sunk almost to zero, and one of its arteries (femoral) was connected, by glass canulæ and simple india rubber tube filled with carbonate of soda solution, with the artery of another healthy animal. The connection was in every case followed by a recovery of the depleted animal almost magical in its rapidity and extent. It was found that a flow of one minute's duration was generally enough to restore the patient, and further that there was little or no danger of the flow of blood from the donor being excessive, for the pressure in the arterial system of the recipient speedily became equal to that in the donor. Out of many experiments of this nature in only one was the ultimate result unsuccessful, death occurring on the seventh day from secondary hemorrhage. But in this case the animal was unhealthy (skin disease) at the time of the operation.

It was pointed out that the ordinary risks of transfusion, such as the introduction of air or clots into the veins, and the supervention of phlebitis, are absent from this operation, and that it has further the advantage that no apparatus is required beyond a simple tube, and that the blood is at once introduced into the situation where it is most needed—viz., the arterial system. The difficulties that are presented by the use of arteries for transfusion were not lost sight of, but it was insisted on that the very general fear of dealing with arteries is in great measure unfounded; especially if a minor artery is employed. In the human subject it is recommended that the dorsal artery of the foot should be used both to yield the blood and to receive it. The exact method in which the operation is to be performed was described, and the tubes and canulæ recommended were exhibited.

The details of the experiments on transfusion, and especially of transfusion from vein to vein, instead of from artery to artery, then followed. These showed that transfusion from vein to vein, through a simple india rubber tube with glass termini previously filled with carbonate of soda solution, was both easy and, except in extreme cases, in which the heart had almost ceased to beat, rapidly effectual. It was found that the intervention of an elastic pump, as in Aveling's apparatus, did not accelerate the flow, but in some cases stopped it by sucking in the wall of the vein, and was, moreover, liable to force clots into the patient's vein. And it was pointed out that there is no object in measuring the amount of blood which flows except by the effect produced upon the patient and the donor.

Finally it was recommended, as the result of these experiments: 1. That fluids other than human blood should never be used for transfusion in cases of hemorrhage. 2. That transfusion should always, if possible, be effected through a simple flexible tube with glass canulæ. 3. That direct centripetal arterial transfusion should, if possible, be employed. 4. That failing any person willing to submit an artery to yield the blood, but ready to allow of the exposure of a vein, direct venous transfusion be employed. 5. If it is impossible to attempt either arterial or venous direct transfusion, immediate transfusion of either unwhipped or whipped blood collected into a funnel and allowed to flow through an india rubber tube and glass canula into a vein can be tried, although with greater risk of the introduction of clots and of the germs of putrefactive bacteria into the vascular system of the patients.

The President, Dr. Playfair, expressed his sense of the great value of the report. At the same time he felt that there were great difficulties in carrying out direct transfusion, especially the arterial. The objection to opening an artery, and the state of general confusion of a household at the time transfusion was required, rendered it extremely difficult.

Dr. HICKS agreed that it was impossible in many cases to effect direct transfusion, and asked if saline solutions (such as of phosphate of soda), used to prevent the blood to be transfused from coagulating, rendered people more liable to hemorrhage after its use.

Dr. CHAMPNEYS stated that the effect of transfusion of lamb's blood in persons suffering from exhausting disease at Dresden were blushing, dyspnœa, hæmaturia, and, in some cases, urticaria. No fatal cases occurred.

Dr. AVELING objected to arterial transfusion, preferred venous, and advocated elevation of the limbs and buttocks, with lowering of the head.

Dr. CORY had transfused three times—twice with saline solution, both died; once by Roussel's apparatus, and the case recovered.

In reply, Mr. SCHAFER pointed out the danger from using defibrinated blood, acknowledged the difficulties of direct transfusion, and stated that the blood might be prevented from coagulating by mixing with it saline solutions, but the transfusion of such a mixture would prove fatal.

Section of the Ciliary Nerves for Sympathetic Ophthalmia.

The origin of sympathetic ophthalmia is still a matter of discussion; it is, however, generally referred to the irritation of the ciliary nerves, and not to that of the optic nerve. According to the *Journal de Médecine et de Chirurgie Pratiques* for December, 1879, M. ABADIE has consequently come to the conclusion that by destroying by section the influence of these nerves, he would arrive at the same result as by enucleation of the eyeball. He has obtained this result in a good many cases. The section of the ciliary nerves did not modify the state of the eyes when the cornea was transparent; in the other cases, the patient tolerated the presence of an artificial eye, and sympathetic ophthalmia has thus been arrested.—*British Med. Journal*, Dec. 27, 1879.

On the Pathology and Treatment of Detached Retina.

Dr. F. MORANO (*Giornale Internazionale delle Scienze Mediche*, n. s. Anno I. fascic. 9, p. 959) enters into the subject at considerable length. He considers that the researches of Ivanoff, Poucet, and Raehlmann have conclusively established that detachment of the retina can arise from several distinct causes. Choroiditis is perhaps the most common, but partial or total liquefaction of the vitreous body in progressive myopia is also another. He believes that, so long as the vitreous body is unchanged both in volume and physical properties, its detachment by the formation of a layer of fluid between it and the choroid is impossible. Detachment of the retina will always be found to depend on *distension*, that is on some *vis à tergo*, never on *attraction*, or *vis à fronte*, except, perhaps, in the case of an intra-ocular tumour. As regards treatment he reviews the various methods of puncture through the sclerotic, with evacuation of the fluid, as suggested by Siebel, of laceration and of drainage. The first of these has, on the whole, given the best results. The last is both dangerous and inefficacious. In the author's opinion, in recent cases of detachment, medical is of far greater importance than surgical treatment. He advises the use of the artificial leech, coupled with absolute repose of the eye in a dark room, a compress bandage, and mercury to salivation, with subsequently, if necessary, a course of iodide of potassium. One case so treated recovered in four weeks sufficiently to read No. 7 of Wecker's test-types.—*London Med. Record*, Dec. 15, 1879.

On Osteogingivitis Gangrænosa Neonatorum.

KLEMENTOWSKY describes under this name three very similar cases, the first he ever met with during twenty years' practice among children, in the Foundling Hospital at Moscow. CASE I. A boy, aged six days, well nourished, healthy, was taken ill with high fever, and an erysipelatous flush on the right cheek. The following day the latter had disappeared, but an œdematous dark swelling had appeared on the gums of the right upper jaw. Towards night two teeth broke through the swelling, and fell out; the swelling diminished in size; ulceration set in four days later, and the child died. At the necropsy gangrene of the upper jaw and pyæmia were found. CASE II. A girl aged one month and a half, badly nourished, had high temperature, and a small gangrenous abscess on the gums of the upper jaw on the left side. On the second day, a tooth broke through the abscess and fell out, the swelling diminished, the temperature rose, and a gangrenous abscess formed on the right side of the upper jaw. On the fourth day it began to heal; on the fifth, peritonitis set in; and on the sixth, the child died. The necropsy revealed purulent gingivitis with ulcerations, and diffuse purulent peritonitis. CASE III. A boy, aged thirty-eight days, well nourished, had gastric catarrh a short time ago. There was high temperature, with a purple swelling of the size of a nut on the gums, corresponding to the right upper eyetooth. On the second day a tooth pierced the tumour, and fell out; was replaced by a dentiform granulation surrounded by necrotic tissue. On the third day the swelling and granulation diminished, and suppuration set in. The wound healed during the following days; but on the fourth the temperature again rose, and a hard reddish swelling appeared on the left side of the gums, corresponding to the upper molar teeth. No pus escaped on incision. During the following days necrosis set in, the swelling beginning from the edges of the incision, gradually exposing a tooth and the bone in the alveolus. There were fetid suppuration, and a gangrenous perforating abscess of the left cheek. Death occurred on the forty-seventh day. At the necropsy it was found that the two posterior thirds of the left half of the upper jaw had become one gangrenous cavity, the periosteum was detached from the zygomatic bone, and the latter was necrotic.—*London Med. Record*, Dec. 15, 1879.

—

On Certain Methods of Improving Vision in Cases of Detached Retina.

Dr. FANO (*Journal d'Oculistique et de Chir.*) suggests that, as detached retina is practically an incurable affection, it would be more rational to direct treatment to utilizing for purposes of vision any portions of retina still remaining unaffected. With this object he recommends making an artificial pupil opposite any existing healthy portion. In cases where one eye is completely, and the other partially, blind from this affection, he would combine a tenotomy with an iridectomy, there being, under the circumstances, no danger of causing diplopia. Much good, he thinks, might also in many cases be done by the judicious use of prisms. Various prisms should be tried in succession, until one has been found which makes the rays of light fall on the most percipient portion of retina. It should then be worn permanently. If necessary, the treatment by prisms may be combined with an iridectomy or a tenotomy, or with both.—*London Med. Record*, Dec. 15, 1879.

—

On Injections of Chloride of Zinc in Ranula.

For some years past M. LE DENTU (*Journal de Méd. et de Chir. Pratiques*, Nov. 1879) has studied and endeavoured to determine the indications for, and the method of, operation in treating ranula by injections of chloride of zinc. Three years ago he was deputed to make a report on this plan, as recommended by M. Théophile Anger for ranula and hygroma. The method appeared to him to be excellent for the latter affection, but less adapted to the former, in consequence of the violence of the inflammation it might bring on. It is with the object of avoiding this complication that M. Le Dentu has endeavoured to exactly determine the conditions under which this operation should be performed. The solution employed is the deliquescent chloride of zinc, which is transparent in its upper strata, and turbid at the bottom of the vessel. The instrument used is a syringe of gutta percha, which cannot be injured by the liquid. The injection also is very easily made. The canula should be introduced to a certain depth. Immediately a sensation of heat is produced, which soon irradiates and spreads throughout the mouth. The syringe is removed, and a small white spot is seen at the point of puncture. The quantity of liquid injected should never exceed two drops, and should sometimes be less. In a short time the burning sensation extends to the side of the face, and is replaced by neuralgic pains. It may also take on the character of inflammatory pain, and give rise to dysphagia. Sometimes even there are respiratory troubles, which proves that the œdema may extend to the opening of the larynx. The swelling takes two or three days to attain its maximum, and may then be of considerable proportions. At this crisis the patient may suffer positive anguish, but after the third day only a small amount of inflammatory induration at the level of the ranula remains. The swelling, which still persists, disappears gradually, and the original tumour disappears completely. These are the principal phenomena noted after operation. M. Le Dentu has performed it six times under the following conditions. The first patient was a woman having a tense elastic but depressible ranula. Two drops of chloride of zinc were injected into the tumour, and the result was a very acute and even alarming reaction, causing apprehension of some complication. However, none occurred, and the patient was radically cured. In the second case the patient had already been operated on, and the tumour had again made its appearance. One drop and a half injected into the ranula, which was small, did not induce any reaction, but only a little pain and swelling of the region. Cure in this case also was complete. In another case a woman, aged twenty-two, had a very full and tense tumour. With two drops of chloride of zinc the reaction was extreme; dysphagia and even dyspnœa were produced. Nevertheless, cure was effected, as in the other cases. A ranula developed itself in a girl, aged ten, and opened itself every week by the same orifice. A drop and a half brought on only an ordinary reaction, such as is desired in all cases, and was followed by cure in ten days. Finally, in two cases in which small ranulæ were present, half a drop only was injected. A small unimportant sphacelus was produced, which in no way hindered the cure. From his observations, M. le Dentu concludes that the injection of chloride of zinc into the ranula constitutes an almost infallible method of cure, but of which the handling exacts certain important precautions. The reaction in fact is variable, according to the cases, and probably has reference to the previous condition of the sac. The tension of this sac appears to have a great deal of influence on this result, and in the cases in which it was very pronounced reaction has been the most marked, so that it may be questioned whether it is not indicated to relax the sac, by previously removing a certain quantity of the liquid contained in it. It is equally important to define the quantity of chloride of zinc to be used for the injection. A drop or half a drop is sufficient for small ranulæ. In tumours of a medium size a drop and a half, and in fully developed ranulæ two drops are the maximum, which should never be exceeded. In children especially only very small doses should be used, because the serious phenomenon of reaction are more to be feared than in adults.—*London Med. Record*, Dec. 15, 1879.

Cancer of the Breast following Eczema of the Nipple.

At a late meeting of the Clinical Society of London Mr. G. LAWSON reported the case of a married lady fifty-one years of age, who consulted Dr. Tilbury Fox in July, 1878, for a chronic eczema of the right breast, which she had had for several years, but which had not healed. Dr. Fox asked Mr. Lawson to see the case, for fear there might be evidences of cancer, but at that time the gland itself was unaffected; the nipple, however, was slightly retracted; the axillary glands were not enlarged. Twelve months later the patient came again, and now the breast was large and hard, and there was an enlarged gland in the axilla. Sir James Paget, who was consulted, concurring, Mr. Lawson removed the breast and lymphatic gland; the wound healed rapidly, and at the end of three weeks the patient returned home. There has been no recurrence hitherto. Dr. Thin, who examined the organ microscopically, found the diseased skin to be sharply limited by a zone in the epidermis; the corium was the seat of chronic destructive inflammation, and the connective tissue of the nipple was infiltrated with epithelioid cells; the small portion examined contained no ducts, so that direct continuity of change in them and the gland (which was the seat of well-marked epithelial cancer) could not be traced. Mr. Lawson remarked that the case belonged to the class drawn attention to by Sir James Paget and Mr. Butlin, where eczema of the nipple preceded cancer of the breast. It might be doubted if this so-called "eczema" is indeed a true eczema, owing to its long duration and intractability. In this case (the specimen was shown) the patient had suffered four years from what had been regarded as eczema of the nipple, and that her breast might become the seat of cancer was frequently anticipated. The important practical question was whether in cases of intractable "eczema" of the nipple the breast should be excised, thus anticipating the development of cancer. In one case where an ichthyosis of the tongue had lasted for eighteen years, he had excised the organ, from the knowledge that such a condition almost invariably terminated in epithelioma. On the same principle he also frequently excised an eye which had been dangerously wounded, in order to anticipate the development of sympathetic ophthalmia on the opposite side.

Dr. THIN was, and still is, of opinion that the cutaneous change in these cases is not eczema; a papular or vesicular eruption with exudation did not suffice for the diagnosis of eczema, and in the present case the very sharp line of limitation of the affected patch was against its being an eczema; were it so, there would have been intolerable itching. He did not regard the "eczema" as preceding the cancer, but the contrary. There was evidence of epithelial growth in the lactiferous ducts, and he suggested that the epithelium might remain long affected but quiescent, still, however, causing the production of a certain amount of "cancer-juice," which would produce a distinctive and incurable affection of the skin in the vicinity. To treat such an affection as if it were an eczema was to ignore its cancerous condition. Eventually, however, the change is propagated to the gland itself and to the neighbouring lymphatics.

Mr. BUTLIN said that he was to a certain extent responsible for the use of the term "eczema" in this connection; for Sir James Paget in his paper on the subject had called it an "eczematous condition." It was a raw, excoriated condition of the nipple, which was constantly discharging. In most of the cases he had seen the nipple was in this state. In one case the nipple protruded, was redder than the opposite nipple, and was covered with small scales. It did not discharge from the surface, but was firmer and less elastic than the opposite one. Histologically this nipple presented the same characters as in the other cases, with change extending down the ducts. In the first case he described, he found all the ducts in the nipple full of diseased epithelium, but in others the change was limited to some of the ducts, which could, however, be traced directly down to the cancer in the gland.

Sir JAMES PAGET said that the subject was one of those in which clinical and pathological facts had not yet come to accord. Perhaps it was unwise to give the name of eczema to the condition, for the rule should rather be, if any breast had suffered long from great disturbance of nutrition, it was in risk of becoming cancerous. He said "becoming cancerous," for from the clinical point of view he would differ wholly from Dr. Thin; for there were stages in this disease in which it was curable. Nor do they stand alone; they are examples of a very large group of affections which are liable to become cancerous. Mr. Lawson had referred to one of them—*e. g.*, ichthyosis of the tongue. It would be bold to say that all these were cancerous from the beginning, especially as for periods of three or four years their progress was so slow and hardly observable, and then cancer rushes in. Another group allied to these was that of scars after burns of the lower extremity. If in advanced life these begin to ulcerate, they are very liable to become cancerous. So again with syphilitic disease of the tongue, and many more conditions in which cancer was likely to supervene later in life. What the precise changes are—whether the result of a gradual process, or the intervention of some new factor—he could not say; but from the clinical side there was a time in such cases when the disease was not cancerous, and a time beyond which cancer is almost sure to occur.

Mr. HUTCHINSON said they were clearly dealing with the pre-cancerous stage of cancer, and they should feel obliged to Mr. Lawson for his advocacy of prompt and energetic intervention in such conditions. Some years ago he wrote a paper "On the Successful Cultivation of Cancer," to draw attention to the ill that resulted from the use of mild measures. He doubted the wisdom of attempting any very accurate definition of eczema. The important fact was that cancer supervened upon that which clinically and commonly is styled a local eczema. The term eczema did not admit of precise definition; it did not embrace any one clinical group of symptoms. So that it was very probable that in some cases a disease which is a local disorder of the nipple ends in inducing cancer, as the patient advances in years and the cancerous period of life is entered on. And this may be, although some cases (a minority) did recover, and did not issue in cancer; and he thought Mr. Lawson had well put it in saying that if an eczema of the nipple *resists* treatment for a long time, then surgical interference should be had recourse to. He also agreed with Mr. Lawson in his advocacy of early treatment in ichthyosis of the tongue. He had removed such a patch, which to the naked eye showed no evidence of cancer; but it was in the precursory stage, and an experienced histologist, who examined it, reported that carcinomatous elements were present in it.

Mr. H. MORRIS had had two cases under observation which bore out the facts stated. They also presented the clinical history of this so-called eczema of the nipple, and ended with mammary cancer and widespread cancer in internal organs. The duration of the condition of the nipple and areola—in one case five or six years—was far too long to suppose that the cancer in the breast had preceded it, the duration of mammary cancer being seldom more than twelve months. At the same time age should be taken into account; for there had come to the cancer department of the Middlesex Hospital a girl, eighteen years old, who had had ulceration of the nipple and areola. She had been told that it was cancer. It was a very difficult point to know when to advise removal of the breast showing this condition, and just the same difficulty was present in regard to ichthyosis of the tongue. He knew of a man with the latter affection, from which he had suffered for four or five years, but he had not felt warranted in operating. The number of cases at present observed was too small to formulate any rule as to the length of time which this condition of nipple should be allowed to last before it was right to operate. During the last ten years he had seen very many cases of mammary cancer in the cancer department at the Middlesex Hospital. When he was registrar, there was no case in which a history of previous ulceration of the nipple was ascertained; and out of upwards of 500 cases he had seen in the past six years in only two (those he had cited) had this condition preceded the cancer.

Mr. LAWSON, in reply, said that he would content himself with giving the opinion of the late Mr. De Morgan on this subject. On May 15, 1875, he saw a case of "eczema of the nipple" with Mr. De Morgan, who, deeming it to be an epithelial cancer, destroyed it by chloride of zinc. On Dec. 19, 1877, Mr. Lawson saw the patient again, and she had a large bunch of glands in the axilla, which he removed, after consultation with Sir James Paget. The patient was now dying from internal cancer.

Dr. THIN, in reply, said that he did not mean that the cancer of the mammary gland preceded the skin affection, but that the ducts in the nipple were the seat of abnormal and irregular epithelial growth, which might remain so for years without change. If the diseased parts be removed at this stage, recovery might be assured; but the longer it lasted the more risk there was of the membrana propria of the ducts giving way, and the epithelial growth spreading into the connective tissue and into the gland-substance.—*Lancet*, Nov. 1, 1879.

On Syphilitic Stricture of the Rectum.

In M. GOSSELIN'S opinion (*Gaz. des Hôpitaux*, Aug. 21, 1879), this kind of stricture is of an inflammatory nature, resulting from fibrous transformation of the submucous cellular tissue, and perhaps also of the mucous membrane itself, following an inflammation of these structures, having its origin in a rectitis caused by chancres of the anus. M. Gosselin calls this "syphilitic rectitis," and also calls the stricture which is the consequence of it "syphilitic stricture," but states that he does not therefore mean that it is dependent on the syphilitic diathesis, but simply that the origin of the rectitis is a chancre, causing inflammation of the anus, which inflammation afterwards extends into the interior of the bowel. As regards treatment, M. Gosselin, till lately, has been content simply to dilate, and in cases of narrow strictures of small extent, to notch them with a bistoury at several points. Now, however, he employs the treatment recommended by Verneuil, which consists in complete section of the strictured parts by Paquelin's cautery. By this means the retention of feces and purulent matter above the stricture is prevented.—*London Med. Record*, Dec. 15, 1879.

On Bubon d'Emblée.

The term "Bubon d'emblée" means the absorption of virulent pus at a certain point, and its transport to a lymphatic gland without appreciable lesion or solution of continuity of mucous membrane, skin, or lymphatics. M. MAURIAC has never seen such a case, but reports (*Gaz. des Hôpitaux*, June 12, 19, July 1, 31, 1879) three cases which might easily have been mistaken for bubon d'emblée. Case I.—A man, aged 38, was admitted under M. Mauriac's care in November, 1874, with a swelling in the groin, but nothing on the genital organs, and no history of a sore since 1867. The swelling burst and left a large ulcer. No signs of syphilis could be made out. The sore in the groin became so like a chancrous bubo that M. Mauriac diagnosed it as such, supposing that a chancre had existed, and had been so small as to have escaped the patient's notice, and healed before he came under observation. Auto-inoculation, and afterwards cauterization, was ordered; but, through some mistake, the ulcer was cauterized first, so of course inoculation was useless. Iron was given internally, and various applications, including a solution of tartrate of iron, were used locally. Cicatrization took place at the end of a month, and the patient went out. Some time afterwards, the man was re-admitted, as the sore had broken out again. The scrotum also was implicated, and the ulcers became phagedenic. M. Mauriac now thought of syphilis, and prescribed specifics, under which rapid improvement at once occurred. This man, in M. Mauriac's opinion, assuredly became syphilitic in 1867, but the disease had afterwards remained latent. Latent syphilis is not uncommon, and may cause mistakes in diagnosis, as in this case. When in doubt, the repetition of morbid action in the same place, as happened here, may put one on the right track. Case II.—A man, aged 34, had painful swelling in the right groin, which finally burst and discharged much pus, but the opening did not heal. Inoculation gave no result. There was no lesion of any part of the area supplied by the lymphatics to account for the abscess. No other glands were enlarged, and there were no signs of syphilis. The man had had chancres six years previously. Gumma of the glands was diagnosed, and mercury and iodide of potassium were given, simple ointment being applied to the sore. In twenty-three days it was almost healed. Case III.—A man, aged 54, who had not had any connection for more than six months, had a swelling in each groin, oblong, red, and fluctuating. No lesion of penis, scrotum, thighs, perineum, or anus could be discovered. In 1875, he had been treated by M. Mauriac for mucous patches of the scrotum and throat. The swellings were incised, and much thick offensive pus escaped. The wounds became phagedenic, and put on exactly the appearance of virulent buboes. Inoculation gave negative results. Under large doses of iodide of potassium internally, and the local application of iodoform, the sores healed completely. The inguinal swellings in this case were perfectly symmetrical. M. Mauriac has frequently observed the symmetrical development of gummatous formations, and was much astonished to find that Mr. Hutchinson regarded asymmetry as a distinctive character of tertiary lesions. M. Mauriac then ably criticizes various cases put forward by different observers as examples of bubon d'emblée, and comes to the conclusion that there is no satisfactory case on record. In a doubtful case, inoculation should always be practised, and, failing that, specific remedies should be tried.—*London Med. Record*, Dec. 15, 1879.

Soldiers' Feet.

Under the title of "A Special Affection of the Feet in Railway Navvies, and a Tumour of the Feet occurring in Infantry after Forced Marches," Dr. **Dawosky** and Surgeon-Major **Weisbach** of the German army describe one and the same affection, observed by the one in navvies employed on the railway, and by the other in foot-soldiers (*Deutsche Militärärtzliche Zeitschrift* and *Archives Médicales Belges*, April, 1879). This affection, characterized by a swelling of the upper part of the foot, with redness and heat, is accompanied by extremely sharp, lancinating, and burning pain. This pain constitutes the initial symptom, and commences at the sole of the foot, whence it spreads towards the middle of the top of the foot, and even as far as the knee and thigh. In navvies, this affection has shown itself more especially in the right foot; in some cases, however, both feet have become involved. In soldiers, Herr Weisbach has found it in both feet, and more especially pronounced and painful along the course of extensor tendons of the second, third, and fourth toes, as well as in the vicinity of the metatarso-phalangeal joints of the same toes. Both writers attribute this affection to a change in the position of the foot, brought on in the case of navvies by the necessity of wheeling earth on narrow planks, on which the foot cannot spread itself out completely as in ordinary walking; in soldiers, by fatigue and muscular relaxation. This change has the effect of inclining the foot more inwards and throwing the weight of the body more outwards, thus causing contusion of the heads of the metatarsal bones and strain of the ligaments, especially the transverse ones, twisting them together. This continuous morbid action, becoming permanent, naturally ends by producing inflammation of these ligaments and of the adjacent tendinous sheaths, whence the affection, gradually spreading, soon shows itself in a more definite form on the upper surface of the foot, where the looser cellular tissue is more amenable to œdematous distension. Both authors recommend rest in the way of treatment above all things for the injured organ immediately on the appearance of the initial symptom, pain. Thus, the development of the affection may be arrested. Should it be completely established, M. Dawosky recommends multiplied scarifier irons round the affected portion, and even the opening of the superficial veins to induce a more copious hemorrhage. When this has ceased, the patient should remain quiet for several days, and have recou to cold water bandages if necessary. In the case of workmen who can be c ried to a hospital in the vicinity, simple scarifications are replaced by cuppi with the scarificator.—*British Medical Journal*, Nov. 29, 1879.

Perforating Ulcer of the Foot.

ENGLISCH (*Wiener Med. Jahrb.*, 1879, s. 81) has collected 109 cases of pe forating ulcer of the foot, independent of those forms of ulceration arising connection with leprosy, syphilis, and cancer. Five of these came under h own observation. He found that the frequency of this disease increases in reg lar proportion from the heel to the toes, but in its localization it keeps to the di tribution of the bursæ mucosæ on the sole of the foot. So far this localizati corresponds with that of callosities, which, however, in no way, as a comparis with ulcers or callosities on other parts of the body shows, imparts to the ulcer tion its specific character. After Englisch reviews the neuro-paralytic theory the perforating ulcer, he comes to the conclusion "that it is an inflammatory a ulcerative process, occasioned by a peculiar change taking place uniformly in t vessels, which corresponds to the endoarteritis obliterans of Friedlander or pr liferans of Billroth. With reference to the ultimate cause of this endoarteriti Englisch observes that many authors state how an extreme chilling has precede the disease, from which the frequent bilateral or symmetrical occurrence of t disease can be explained. Besides, Englisch agrees with Friedlander that, und the influence of the tuberculosis, also, changes of the skin and its vessels can b set up which present similar characters as the perforating ulcer, in particular i markedly chronic course, with a not unfrequently continuous rise of temperatur Englisch can, in relation to the age at which it occurs, well establish a predile tion for the fifth decade, but no direct influence of more advanced years.—*Edi burgh Med. Journal*, Dec. 1879.

On Amputation of the Hand in the Continuity of the Carpo-Metacarpal Joint

DR. SILVESTRI proposes (*Med. Contemporanea*, Aug. 1879) a new method amputation of the hand in the continuity of the carpo-metacarpal joint, to whic he gives the name of "the method by double palmar flap." He performs th operation as follows. The hand having been placed in the prone position, a assistant grasps the wrist, and makes the skin tense, while the operator traces curvilinear incision, with its convexity downwards, through the skin and subc taneous cellular tissue. This incision should commence and terminate half a ce timetre below the tubercles which mark the upper extremities of the first a fifth metacarpal bones. It should include the skin, but not the deeper tendino masses. The hand is now to be supinated, and a double palmar flap traced ou the external portion of which comprises the hypothenar eminence, the intern the thenar. The starting point of these incisions should be from 20 to 25 millimetres below the fold in the skin of the forearm, which marks the position of th radio-carpal articulation. They should extend downwards to the level of th interdigital fold of the thumb, and comprise the skin and palmar fascia, as fa down as the layer of flexor tendons. The hand is now once more pronated, an the knife entered under the extensor tendons, which it divides transversely, commencing with those of the little finger. The cut ends of the tendons are ne turned down, and the carpo-metacarpal articulation comes into view. Aft division of the radial extensors from above downwards, and of the insertion the abductor longus pollicis, which are the best guides to the line of articulatio the joint may be partially opened on its dorsal aspect by one sweep of the knif

The author uses the word "partially" advisedly, as it will be found impossible to dissociate completely the metacarpal bones of the last four fingers. This is owing to the existence of a hitherto undescribed interosseous ligament, which is attached superiorly between the two contiguous facets of the os magnum and unciform, and inferiorly between the two facets of the third and fourth metacarpal bones. It is a fibrous band, filling a longitudinal sulcus, especially designed for its reception. When this ligament has been divided, the joint at once falls open. The final step of the operation is to cut through the two fleshy masses of the thenar and hypothenar eminences, keeping the knife as closely as possible to the bones, and following the lines traced out in the early palmar incisions. The result is a double flap, which when laid over the stump will appear single, and will be found to adapt itself very accurately to the dorsal flap. The wound should be closed with sutures, and a drainage tube inserted in the radio-carpal canal, which will be more or less patulous, owing to retraction of the flexor muscles and tendons. As regards the objections which may be urged against the operation, the chief are (*a*) the difficulty of execution, and (*b*) a greater liability to inflammation and purulent infiltration, due to the presence of so many small bones and articulating surfaces in the stump. As to the former of these, the author holds it has no real weight, except in the case of very old subjects, in whom possibly the articulating surfaces might be ossified. As to the latter, it must be combated by careful antiseptic treatment. The advantages claimed are a greater length of limb, a skin-covering admirably adapted to bear friction or pressure, and a form of stump more suitable for the application of any artificial means of prehension. The memoir is carefully written, and accompanied by five lithographic drawings, which tend very considerably to elucidate the somewhat complicated steps of the operation.—*London Med. Record*, Dec. 15, 1879.

Excision of Both Hip-joints for Symmetrical Femoral Necrosis.

At a late meeting of the Clinical Society of London (*Lancet*, Dec. 6, 1879), Mr. CROFT read the notes of a case of this in which the operation was performed antiseptically, and with a successful result. The patient, a child four years of age, was admitted into St. Thomas's Hospital on January 3, 1879. Two years previously she had fallen down stairs, and some months later began to limp and suffer from pain in hips and knees. For some time she was treated as an out-patient, but did not improve. She became thin and pale, and the cornea ulcerated; the thighs became flexed on pelvis, and legs on thighs; and in this state she was taken into hospital, when the limbs were straightened, and her health improved. At the end of February evidence of fluid in the left hip-joint was manifested, and some thick puriform fluid was evacuated by aspiration. The effusion re-collected, and on May 17th the left hip was excised antiseptically and subperiosteally. On June 17th the right hip was excised in the same way. The wounds healed in about five weeks from the time of operation. On each side there was extensive necrosis of the neck and head of the bone, the epiphysis being detached. There was also swelling of the synovial membrane.

The case illustrated the value of early operation before the third stage is reached; it showed also the security of antiseptics, the advantage of freely removing the diseased parts, and of leaving the muscles attached to the trochanter. The case was also interesting from its double and symmetrical character. Had not the operation been done early, the case would have gone on from bad to worse, the joints would have become anchylosed, and the chances of death from tuberculosis or amyloid disease would have been great. There was hardly any pyrexia after the operations, an important thing in cases of supposed tubercular disease. He largely attributed the good results to section of the femur through undiseased bone, and the destruction of the synovial membrane by chloride o zinc. The glutei were not detached from the trochanter, which has now renewe its attachment to the shaft, thus permitting of good movement and avoiding bon anchylosis.

He had performed excision of the hip forty-five times; twenty-one were instances of necrosis of upper end of femur or of acetabulum. If the surgeo knows there to be dead bone in a joint, he is bound to remove it. He strongl condemned the practice of leaving these cases unexplored, and unrelieved. Case of a subacute or chronic kind, traceable to injury, probably depended on osteitis and he would say that when there is fluid in such a joint, an incision should b made antiseptically and the joint explored. When uncertain as to the state c the bone, the surgeon should excise, and if he were sure that necrosis had occurred, he had no other alternative than excision.

Mr. BRYANT said the case opened up the whole question of excision of th hip—as to the value of the procedure, the conditions calling for it, and also th pathology of joint disease. Clearly the case was one of osteitis, to which probably nine-tenths of the cases of hip disease in early life were due; whereas i adults the primary synovial form was more frequent. There could be no doub as to the propriety of the operation, for whenever necrosis had taken place i should be the rule to operate early. But it could hardly be claimed that in thi case the operation was done *very* early. The disease had arrived at a well marked stage, and its course had been so marked and so rapid that no hesitatio about operating could have occurred. He demurred to the operation bein styled "subperiosteal." There was necrosis of the head of the femur, disorganization of the capsule of the joint, and the neck of the bone was quite denuded, so that only the trochanter could strictly be held to have retained its periosteum. He felt at a loss to know what surgeons meant by a "subperiosteal" resection under these conditions. The object of excision was to remove the disease. A stiff joint, with anchylosis, would not be a satisfactory result. I might, indeed, be hardly right to try to save the periosteum, if it were possible and for himself he had often tried, but always failed, to strip off the fibrou covering of the trochanter, and he had come to regard the "subperiosteal" section as a fanciful thing. It would be otherwise if dealing with a normal joint then a subperiosteal section would be possible. But to remove a healthy head o the femur would be an error. Mr. Croft had urged that when the joint was foun to be full of fluid it should be cut down on antiseptically, and if the joint wer then found to be healthy the surgeon should go no further. But he (Mr. Bryant maintained that the joint should not be so treated, but that measures to obtai the absorption of the fluid should be tried. If Mr. Croft meant that they shoul not cut down into a joint unless there was strong evidence of its containing pus the question would be different. The bulk of cases being due to disease of bone resection should follow the incision into the suppurating joint. He followed thi practice himself in most cases, but sometimes, when it is doubtful whether ther is necrosis, he does not proceed to resection. He would like, then, for som further explanation as to the meaning of an "early incision" in these cases. A to definite stages of the disease, he did not recognize them. A stage of disorganization he knew, and a stage of open suppuration, but to speak of first, second, and third stages was unintelligible to him. The stage differs according t the cause of the disease—*e. g.*, in acute necrosis it runs through its whole evolution in the course of a few days.

As to resection of the hip, he was, as a rule, disappointed with its results. Th cases of good result were very few as compared with a large class, in which a crippled limb, not fit for walking was left; and the even larger class alread doomed by the presence of visceral disease. It might be that surgeons were disposed to wait too long for Nature's processes, and thus cases came to excision too late, when lardaceous disease was already established, and this was a strong argument in favour of early interference. But *when* should the surgeon interfere? He was afraid that "antiseptic surgery" had induced surgeons to operate without necessity; an over-confidence in its safety disposed them to deal with joints too freely, and to resect joints which pathologically were curable. As a surgeon who had lived in the pre-antiseptic period, or rather before the introduction of the protecting spray, he could not help asking himself if some of the cases could not have got well had they been left to nature? He feared that Mr. Croft had fallen into the new system; and he could not but think that Nature was competent to absorb serum effused into a joint.

Mr. **Hulke** congratulated Mr. Croft on the brilliant result of his case, although he could not assent to his deductions. If there was one lesson to be gained from observation of these cases more than another, it was this—viz., the necessity of giving the joint complete and absolute rest from the time of the very earliest manifestation of disease. The present case was for some months treated as an out-patient, and during that time the joint could not have had that complete immobility so essential for its recovery. He had again and again seen joints suffer from the non-observance of this principle. He believed that disease of any joint in the body in childhood commenced as an osteitis almost invariably. As to operative interference, he would concede its being called for whenever the presence of necrosis extending into the joint could be established, but of that occurrence he knew of no strict indication. He agreed with Mr. Bryant on the question of opening joints when there was a presumption of fluid in them; and even when there was pus he had seen instances (both of knee and hip) where free incisions and thorough rest, as first pointed out by Mr. Gay, resulted in the retention of free mobility to the joint. He also felt with Mr. Bryant as to the general outcome of excisions of the hip-joint; but, of a large percentage of survivals, he knew of few where a useful limb resulted. For, if these cases were watched for a series of years (an observation falling less to the lot of the hospital surgeon than to that of the general practitioner), it would be found that so great a dwarfing of the limb resulted as to render it almost useless. On the other hand, it must be borne in mind that excision was done, uot merely to save the limb, but to preserve life. He also felt strongly the cogency of Mr. Bryant's remarks upon "subperiosteal" resection. He had always followed the old rule, instilled into him by his German teachers, to keep as close to the diseased bone as he could, and he did not see how this were possible if periosteum were stripped of the healthy shaft in order to divide this at a point below the disease. He had listened to Dr. Sayre's advocacy of the subperiosteal method, without, however, satisfying himself that the operation described strictly embodied a preservation of periosteum. In conclusion, he thought that the joint in these cases should be very early and completely fixed, and in that way many acute and subacute cases would do well. He recalled one case of *peracute* inflammation, which subsided under these measures and the local application of ice. Early immobilization, then, if practicable; but if the case were taken too late for this, and if, in spite of such immobility, fluid accumulated in the joint, and that, too, pus, free incisions and drainage should be resorted to. He had never seen anything but harm come of the use of the aspirator, for it invariably became plugged with flocculi of concrete pus in these cases. Then, if there be reason to believe that necrosis existed, there was no doubt whatever that the sooner excision was performed the better.

Mr. **Parker** agreed with Mr. Hulke in congratulating Mr. Croft on his very successful case. It was so successful that there was nothing to which one could take exception as respected that particular case. He could not quite agree with Mr. Croft in regarding it as an early operation, for the child seemed to have been ill two years at least. Mr. Hulke advocated rest, but he (Mr. Parker) had been disappointed in the ultimate result of this plan of treatment. He had now under care in the East London Children's Hospital two or three cases which had continued to progress although complete rest had been given during two or three months, and in one of these cases disease in the other hip had occurred spontaneously during this treatment by rest. Regarding the general question of treatment by operation, it was disappointing that Mr. Croft, out of his abundant material, had not given the Society the benefit of a critical analysis of his results and experience. It would, probably, have contained much useful information bearing on the diagnosis of the various forms of the disease, and to young surgeons such information would have been very valuable indeed. It was just his own difficulty to know when to operate and when not to operate. There was room for a better classification of the cases. Some tended, no doubt, ultimately to recover, while others just as certainly, in spite of all treatments, tended to progress, and it was very desirable to differentiate the cases in order to adopt the most appropriate treatment in each. Out of seven or eight excisions he had found in five instances the head of the bone loose as a sequestrum in the acetabulum. It would be well if those who had large experience would give younger surgeons the benefit of it. Again, he thought that the methods of operation at present in use were not the best, and that a more surgical method might be adopted. By making an incision from the anterior superior spine downwards along the anterior border of the great trochanter, cutting between sartorius and rectus on the inside, and the anterior edges of the tensor and the two smaller glutei muscles on the outside, a patch of the anterior surface of the capsule would be exposed, and no muscular fibres would be cut across; the neck of the bone is to be sawn across *in situ*. This avoids the necessity of forcibly wrenching the femur out of its socket, in order to saw off the diseased portion, a proceeding by which the periosteum was largely separated from the bone.

Mr. HULKE thought for Mr. Parker to have found, in five out of eight cases, the head of the bone as a sequestrum, was a singular experience.

Mr. BRYANT also thought it curious that so large a proportion of such cases should have fallen to Mr. Parker, and that they ought to be recorded.

Mr. HUTCHINSON'S experience as to the rarity of detachment at the epiphysis was similar to that of Mr. Bryant and Mr. Hulke. He had only met with three or four such cases. Again, the condition he had most often found was one of caries rather than necrosis. He agreed with Mr. Bryant and Mr. Hulke as to a general feeling of disappointment at the issue of cases of hip-resection, and he had never been an enthusiast for the operation. He had seen a certain number of failures, and a certain number in which only partial success was obtained; whilst several of the cases, most successful as regards the limb, had died of lardaceous disease, and he agreed that this fact was an argument in favour of early operative interference. At the same time he was quite sure of the success frequently attending milder measures, as Mr. Hulke had shown. Complete rest by plaster-of-Paris bandage, and, if possible, sea-air, also greatly aided recovery. He felt sure that a far larger number of cases would be successfully treated if they could be transferred to the seaside instead of being kept in a London hospital. Counter-irritation was also very valuable, especially in cases where there was fluid effusion. Rest combined with counter-irritation often alone sufficed, and as a counter-irritant he would mention tincture of capsicum, the use of which he learned a long time ago from a practitioner who was little better than a charlatan. He also wished to congratulate Mr. Croft on the happy result of his case —one of the most successful he had seen.

Mr. H. **Marsh** pointed out that the chief interest lay in the question of the value of excision in hip disease, and he could not but agree with Mr. Hutchinson as to the disappointment often accruing from the operation. He had seen about 120 cases of excision, and thought it would be difficult to show six or seven which had turned out really well. Mr. Croft might reply that this was because the operations had been too long deferred, and that they were not performed antiseptically. It might be so, but so convinced was he of the general failure that it was with the greatest aversion he resorted to it. At St. Bartholomew's Hospital it was an operation now rarely performed. Wide conclusions should not be drawn from a single case. If one was fortunate enough to come across a case in which the head of the bone was detached so that it could be removed as a sequestrum, it did not require any division of bony tissue. He suggested that Mr. Croft should show the case again at a later period. He (Mr. Marsh) agreed with those who had said that necrosis was rare, and that caries was the prevailing condition, for in operating, as a rule, it is carious bone that is cut through, and in many cases he had seen operated on it would have been impossible to have got beyond the inflamed bone without dividing the shaft low down. He believed that early recourse to treatment by perfect rest and counter-irritation would be successful in the majority of cases. He could show many cases of hip-joint disease which had recovered, with fair mobility and walking power, after having been widely suppurating. It must be remembered that Mr. Croft's patient was now much in the condition of children who have congenital dislocation of the hips. He differed from Mr. Hulke in his opinion of the aspirator. By using a sufficiently large trocar he had frequently evacuated large accumulations of pus, with recovery.

Mr. **Croft**, in reply, said that in speaking of an early operation, he did not mean one undertaken in the early stage of the disease, before there was perceptible effusion. He fully recognized this incipient stage, and had been as successful as others in treating the disease when it came under his notice at that time. The case he had brought did not illustrate the treatment he should pursue in the very early stage. The accident which started the disease had occurred two years before the child's admission into hospital. The divisions adopted by Sayre and others were very useful clinical divisions, although they might not be pathologically accurate, any more than it was pathologically correct to speak of "primary," "secondary," and "tertiary" syphilis. Still it might be said that the first stage of hip disease was that which commenced with the onset of inflammatory signs and ended in effusion; the second, from effusion to the formation of open abscess; and the third thence *ad finem*. His case, then, was in the second stage. He had confidence in antiseptics, for he held that a system by which a surgeon could extirpate a loose cartilage from the knee-joint, and send the patient out cured in ten days, was enough to inspire confidence; and under the protection afforded by this system the surgeon was fully justified in freely opening into a joint containing fluid. Probably he would find the fluid purulent, and evidences of pulpy degeneration and of necrosis; but if he did not, no harm would ensue. He would indeed have relieved the symptoms, especially the symptom of *pain*. The term subperiosteal was the most convenient he had to describe what was done. He could demonstrate the possibility of tearing out the great trochanter and leaving the whole of the periosteum behind. Of course the term was not applicable to the head of the bone, but it was strictly so to the neck; and if the bone be turned out, leaving periosteum, the removal is subperiosteal. Antiseptic treatment must be complete, or it is nothing. The key to the disappointment expressed as to the general results of the operation was, that the operation wa not performed early enough. His forty-five cases included four at present i hospital; fourteen sound and well; fifteen had died from one cause or anothe two of them from pyæmia (but not since he had used antiseptics), one fro diphtheria, and the rest from tuberculosis in one form or another. He did no know of any certain indications of necrosis, and he sometimes aspirated joints t confirm the diagnosis of purulent effusion. He thought aspiration for serous synovitis was often followed by a favourable result. He did not wish to draw wid deductions from one case; and he had already shown that his opinions were base on a larger experience. The child could not yet balance herself on the femora but he anticipated that, as the periosteum had been left, new bone would for and a kind of joint be reproduced. He would be well satisfied if he had induce some surgeons to operate early in hip disease.

Attempted Reduction of a Dislocation at the Shoulder-joint of seven or eight weeks' standing; Rupture of a Bloodvessel.

At a recent meeting of the New York Surgical Society (*Med. Record*, Jan 10, 1880), Dr. H. B. SANDS reported the following case. Four weeks previousl he was called by Dr. Rockwell, of Brooklyn, to see a lady eighty-six years o age, who, seven or eight weeks previously, had had her right shoulder dislocate downwards. She was seen by a gentleman in Connecticut soon after the accident and he reduced it without special difficulty. About ten days afterwards the dislocation was reproduced, and then nothing was done towards placing the head o the bone in position until she came to Brooklyn, when Dr. Rockwell made slight attempt to restore it to its place, but without success. Dr. Sands wa asked to give an opinion regarding the propriety of making an effort at reductio and he said that he regarded it as dangerous, and advised against it, but that i the friends and the patient desired, he would make a moderate attempt to pu the bone in place. The lady expressed her desire and willingness to have something done; so she was anæsthetized with ether, and what he regarded as a ver moderate effort to reduce the dislocated bone was begun by putting the left han in the axilla, while with the right, using the arm as a lever, movements usuall resorted to in breaking up adhesions were made. Evidently some of the adhesions did rupture, and after continuing the movements for three or four minute a sheet was placed around the patient's waist, and held from the opposite side b Dr. Rockwell's wife, while slight traction was made upward and outward, a towel being used for the purpose. The amount of traction was nothing like wha he should have regarded as prudent to make, when it was stopped in order t readjust the band about the waist. While arranging to make a second attempt—five or six minutes—he thought he perceived a swelling in the axilla, and calle Dr. Rockwell's attention to it, who thought it merely superficial and caused b the pressure from the bandage, and found what to him seemed to be the sam condition upon the opposite side. Dr. Sands, however, removed the shee when it was very apparent that a bloodvessel had given way; there was a quit rapid increase of the swelling in the axillary region, and it was very soon as larg as the head of a child at term. There was no pulsation in the radial, the ulna or the brachial artery. Feeling very certain that some large bloodvessel ha ruptured, he was apprehensive regarding the ultimate result. Nothing in th way of treatment was done except to place the arm by the side and apply bandage, but within half an hour the skin in the axilla had begun to show discoloration, and within a few hours the discoloration was very marked and extende up to the shoulder. The patient was excessively prostrated by the accident, an at one time it seemed not improbable that she might die from syncope. Hypodermic injections of brandy were given, and brandy by the mouth as soon as it could be swallowed, but she remained in a very low condition for several days, especially at night. In the course of the next day after the accident the extravasation gave signs of its presence quite well, down upon the side of the chest, and later it could be readily seen upon the side of the body as low as the side of the pelvis. The discoloration behind covered nearly the entire scapular region. There was neither fluctuation nor murmur over the region of extravasation. Nothing more serious had as yet occurred; there had been gradual improvement, and although pulsation had not returned in any of the arteries of the right arm, the limb presented no unfavourable appearance. The patient made no special complaint, except with reference to a very uncomfortable tingling, at times, along the distribution of the ulnar nerve. He thought that no other vessel except the axillary artery was ruptured, was gratified at an unexpected recovery from so dangerous an accident, and was surprised that such a rupture should occur from the use of so slight an amount of force. There was no interference with the general nutrition of the limb.

Midwifery and Gynæcology.

Cæsarean Section performed on Account of Cancer of the Rectum.

The following case is related by Dr. KALTENBACH in the *Zeitschrift für Geburtshülfe und Gynäkologie*, B. iv. H. 2: The patient was thirty-seven years old, and had had eight previous normal deliveries, the last three years before. The only symptoms of the disease had been pains in the back and difficulty in defecation during the last two months of pregnancy.

Labour came on at full term, and the child presented by the breech. The author was only called in after three days and a half, when neither the natural efforts, nor attempts at extraction, had succeeded in effecting delivery. The patient then showed all the signs of commencing exhaustion; the pains had ceased, and the fœtus had died. The vagina was found to be obstructed about 3 to 4 cm. above its outlet by a firm, somewhat nodular, tumour, as large as the head of a six or seven months' fœtus, which pressed it forward. Rectal exploration showed that the tumour was immovably fixed to the lower part of the sacrum. There remained only a space of 4 cm. between the tumour and the symphysis.

The author operated, under unfavourable circumstances, with such antiseptic precautions as could be carried out by the use of a solution of chlorine. The placenta was found attached in front, and it, as well as the fœtus, showed signs of commencing decomposition. Some vessels in the uterine wall had to be secured to arrest hemorrhage, and the uterine wound was closed with fifteen silk sutures. The patient was in fair condition after the operation, but died on the sixth day from septic peritonitis.

At the autopsy the uterine wound was found to be gaping widely, but no hemorrhage had occurred. The tumour proved to be a medullary carcinoma, commencing from the rectum, which had grown posteriorly to that viscus, and was attached to the sacrum and ischium.

The author ascribes the failure of union in the uterus, and the gaping condition in which the wound in it was found, not to the effect of the uterine contraction, but to the access of septic material, which prevented the chance of primary union. He now regrets that he did not operate according to Porro's method, excising the whole uterus with the ovaries, and fixing the stump in the abdomin wound.—*Obstetrical Journal of Great Britain*, Jan. 1880.

Puerperal Aphasia.

Sudden loss of speech after delivery is so rare that Kussmaul does not mentic a single case in his work on the *Disturbances of Speech.* A Polish physician, D LEWANDOWSKI, has published a case which came under his observation in tl *Medycyna* (No. 38, 1877); and the reporter of his observation in the *Allg meine Medicin. Central-Zeitung* (No. 33, 1879) adds another which he saw i Paris in 1873. In Dr. Lewandowski's case, the patient had, thirty-six hou after she had been delivered of her tenth child, eaten a basin of broth and piece of cake. The next day, she had repeated rigors, and complained of hea cephalalgia, and sleeplessness. In the tenth night after delivery, the patient suc denly began to scream, utter unintelligible and disconnected words; repeatedl putting her hand to the left side of her head. She was perfectly conscious, but coul give no answer to questions. Her pupils were equal in size; there was phot phobia, but no symptoms of paralysis. Eight leeches were applied behind h ears, and chloral-hydrate given internally. The next day, she could say "No;' and in three days had recovered the power of speaking and writing. The secon case is still more interesting, as the reporter was present at the *post-mortem* e amination. The patient had been delivered without much trouble, and did we for about a week. On the ninth day, rigor, headache, and pyrexia set in. Du ing the next four days, she suffered from slight tetanic convulsions. In the fo lowing days, she retained consciousness, and could move freely her limbs an tongue, but had lost the power of speech. Nothing abnormal could be detected During the following three days, convulsions and somnolence alternated. Sh did not regain consciousness, and died on the seventeenth day after delivery. A the *post-mortem* examination, inflammation of the brain and its convolutions wa found to exist. In the left anterior convolution was a partly decomposed focu of the size of a nut, surrounded by minute hemorrhages. Several purulent fo were in the lungs, and two purulent foci in the uterus beneath the mucous membrane, and suppuration of the veins of the ovario-uterine plexus.—*British Med Journal*, Oct. 11, 1879.

In a Clinical Lecture upon Loss of Speech, Dr. FINLAYSON relates (*Glasgo Med. Journal*, Sept. 1879) two cases in which aphasia, consequent upon righ hemiplegia, came on after parturition. In neither patient was there any evidenc of valvular disease of the heart; neither of them had any history of rheumati fever, and the age of the first woman was thirty-five, of the second thirty-nin It may be concluded, therefore, that the mischief was due to the tendency whic puerperal women have to the formation of clots in their vessels, and so to th subsequent occurrence of embolism in various forms. The recurrence of th attack in both of the cases is remarkable.

The first patient had been seized suddenly, ten days after her second confin ment, three years ago, with slight paralytic symptoms in the right side, and wi very complete loss of speech; she had, however, made a partial recovery, an was able to say "Yes" and "No," and a few isolated words as required; b after her next confinement, in November, 1878, she lost her speech complete The affection of the fingers in the right hand is limited to a little numbness a weakness, and is not at all considerable. She can protrude her tongue quite we but its movements are perhaps somewhat impaired. She is now absolut speechless, except that she frequently gives a little cry like "Ah." She is abl however, both to read and also to understand spoken words, and can write sho replies consisting of a few words.

In the second patient the first attack of right hemiplegia and aphasia occurred suddenly in her ninth confinement, about three weeks after natural labour and convalescence. She then regained speech in a few days, at least to a considerable extent, the hemiplegia passing off in about three weeks. The second attack occurred after the next labour, two years later; the child, when born, was apparently in a state of incipient decomposition, and her labour seems to have been tedious and her recovery slow. The paralytic seizure occurred suddenly about the twentieth day, and the attack was associated with involuntary passing of urine and motions. Her general appearance was indicative of debility and anæmia. The hemiplegia now, after the lapse of four months, appears likely to be permanent, as extreme rigidity has supervened. An almost complete loss of speech also persists. She can, however, say "Ay" and "No," and uses these words correctly as a rule. She also utters a longer jabber of incoherent sounds, and has occasionally said some words, and even short sentences, by accident, as it were, so that it was clear that she had no physical defect in the matter of mere articulation. She seemed, after a time, to understand the words addressed to her very correctly.—*Obstetrical Journal of Great Britain*, Jan. 1880.

—

Intra-Uterine Vaccination.

The question whether it is possible to render the fœtus *in utero* insusceptible of smallpox by vaccinating the pregnant female, has been examined by Dr. A. E. BURCKHARDT in the *Deutsches Archiv für Klinische Medicin*, Band 24. Attention was previously directed to the subject by Professor Bollinger of Munich, in his article on Human and Animal Vaccine, published in Volkmann's *Sammlung Klinischer Vorträge*. He suggested that, as the poison of smallpox was known to be capable of transmission from the mother to the fœtus, a similar condition might be found to exist with regard to vaccine; and that this was supported by the number of cases in which insusceptibility of infants to vaccination might be traced to the revaccination of the mothers during pregnancy. The results of some experiments on sheep also pointed in the same direction. Rickett inoculated about seven hundred pregnant ewes during the last four to six weeks of gestation with *variola ovina*. Their lambs were inoculated when from four to six weeks old with good sheep-pox lymph; no result followed in any case, while thirty-six other lambs treated in the same way had very fine pustules. A similar observation has been made by Roloff. The only observation on the human subject, according to Dr. Bollinger, is that of Underhill, who found, after successfully vaccinating a woman in the eighth month of pregnancy, that vaccination of her infant with recent lymph in the third and fourth months produced no result. Dr. Burckhardt's researches were carried on in Dr. Bischoff's obstetric wards in the hospital at Basel. 1877 and 1878, he revaccinated twenty-eight pregnant women. From various circumstances, however, such as still-births, early removal of the children, etc., only eight of the children were available for observation. To test the accuracy of his results, he vaccinated four children whose mothers had not been vaccinated during pregnancy, and in all produced fine pustules. The results with the children of the vaccinated women were these. 1. The children of four women who were successfully revaccinated during pregnancy were all found to be insusceptible of the vaccine virus. One of them was still insusceptible at the end of half a year; while the lymph employed in the other three cases was used successfully in other children. 2. The children of two mothers who had been revaccinated with partial success were both found insusceptible of vaccination. One of the test children was vaccinated successfully, the other without effect—but perhaps the lymph used in this case was too old. 3. Of the children of two women who had been unsuccessfully revaccinated, one was vaccinated without result, while the operation in the other was successful. The mother of the latter had been revaccinated successfully five years previously. Dr. Burckhardt has made some observations on the subcutaneous injection of vaccine lymph, taking for the purpose a sufficient quantity to vaccinate six or eight persons in the ordinary way and mixing it with a drop of distilled water. The injection of this into the subcutaneous tissue of pregnant women was not followed by local reaction or general disturbance. He treated ten women in this way; but only two of the children were available for experiment. Both were found to be insusceptible; while two other children, vaccinated with the same lymph, had good pustules. Dr. Burckhardt considers it too soon to arrive at any positive conclusions and remarks that the value of the process can only be decided by the results obtained by a number of independent observers.—*British Med. Journal*, Nov. 22, 1879.

The Results of Freund's Operation for Total Extirpation of the Cancerous Uterus.

The mortality of this operation appears to have been greater in the more recent than in the earlier cases reported. In the hands of the author, three of the first five patients recovered from the effects of the operation, and two of the second five, making a mortality of 50 per cent. in the first ten cases. In a Paper read at the meeting of the International Medical Congress at Amsterdam, in September, 1879, Dr. FREUND gives the results of four more operations undertaken since the end of 1878. In one patient, who was enormously fat, he found it necessary to give up the operation after having opened the abdomen. The patient recovered from the effects of the incision. Funnel-shaped excision of the cervix was afterwards performed, but the growth recurred in two months.

The other three patients all died; the first, at Erlangen, in the Clinic of Professor Zweifel, from peritonitis, after four days. The second, in the Clinic of Dr. Schrœder, did well for a week, but died after twelve days. The peritoneal borders of the wound were found covered with pus. The third, at Strasburg, in the author's own Clinic, died from shock, the operation having been undertaken when symptoms of commencing peritonitis had appeared from the carcinoma breaking through into the pouch of Douglas.

The author admits that the results of the operation cannot be expected to improve as those of ovariotomy have done, since, from its commencement, it has had the benefit of the antiseptic method. In view of the increasing mortality, he thinks that a too great liberality has been shown, both in the choice of cases, and in the introduction of modifications of the first method of operating. He intends, however, in future to adopt the plan of permanent irrigation of the vagina after the operation.

Of the five successful cases previously reported by the author, two have since died, one from recurrence of cancer, one from acute pleurisy. A third patient has a recurrence of growth. The author is now of opinion that the operation should be limited to cases of glandular carcinoma of the cervical canal, and that those of ordinary epithelioma or cauliflower excrescence of the cervix, or those in which the growth has reached the outer surface of the cervix, are not suitable for it.—*Obstetrical Journal of Great Britain*, Jan. 1880, from *Centralblatt für Gynäkologie*, Oct. 11, 1879.

Ovariotomy following Incision and long Drainage.

At a late meeting of the Medical Society of London (*Lancet*, Dec. 13, 1879) Mr. KNOWSLEY THORNTON read a paper on Ovariotomy following incision, long drainage, and supposed cure of ovarian tumour. The paper was a record of three cases of ovarian tumour, in which exploratory incision, followed by drainage of the cyst, with injections, had been employed for two of the cases, and injections for the third. All were supposed to be cases of cure of ovarian tumour without ovariotomy. In all re-growth took place, and the author of the paper eventually removed all successfully by ovariotomy. The periods between the first operations and the successful ovariotomies were respectively four years, three and a half years, and eleven years. All these operations were complicated by serious adhesions, and all the cases presented features of special interest, apart from those common to all. In some concluding remarks the author referred to the special features of interest as follows: It is very remarkable that two of these cases should have survived such grave dangers as the sponge being left in and secondary hemorrhage, after also escaping the almost equal dangers of tapping and drainage. The fact of a sponge being left in the peritoneum was by no means the solitary example of this accident in ovariotomy, but this was the first recorded case in which recovery had followed its removal. The author had twice before had hemorrhage from slipping of a ligature, but neither case recovered, and among many similar cases he had heard of in only one was the patient's life saved, and in that case the hemorrhage was discovered and stopped almost directly after the operation. He attributed recovery in his own case entirely to the antiseptic method, and he called attention to the striking difference in the rapidity of the recoveries in the two aseptic cases as compared with the putrid case, the grave accidents to which the former cases were exposed merely accentuating this difference. In all three cases the steady progress was much aided by regulating the temperature with the ice-water cap. The cases, taken together, teach two important lessons: 1. The thoroughly unsatisfactory nature of the so-called cure by tapping and drainage; a lesson which the pathology of ovarian tumours might teach without surgical experiment. 2. The important fact that cases which have been treated by this unscientific method may still be successfully dealt with by the major operation of ovariotomy, even though many years have elapsed since the supposed cure. Other points of interest were: the entire absence of adhesion between the cicatrix and parietes in Case No. 1; the method of dealing with very firm adhesion to intestine; certain points as to antiseptic operation in presence of putrid sinus; the entire absence in Case No. 3 of any sign of the entire rupture of the linea alba, which had taken place at the time of the former operation; the danger of trusting to a single ligature, however small the pedicle; and the importance of not being hurried into opening the abdomen without the spray in case of secondary hemorrhage into peritoneum.

Mr. DORAN said that the reason why drainage was unsuccessful in these cases is because it is required to act contrary to the laws of gravity. The reason was well seen in the rapid evacuation and cure of abscesses connected with the urethra.

Dr. WILTSHIRE said these cases showed the folly of attempting to cure ovarian disease by tapping and drainage. He thought when the cyst-wall was too firmly adherent to the bowel for removal, that the epithelial layer of the cyst should be carefully dissected off. He knew of a case where fatal hemorrhage occurred from a vessel in the pedicle being pierced by the sharp-pointed needle used in transfixion. In this case the pedicle had been tied in two halves, thus leaving the punctured vessel gaping. He agreed that many cases were now successfully treated by the aid of antiseptics which would not do without them.

Mr. THORNTON, in reply, wished that all misfortunes in surgery could be brought before the profession. He agreed with Mr. Doran's remarks about drainage. The adhesions in these cases were merely secondary, and the pedicles were long and would not have presented any difficulty to primary ovariotomy.

He thought the slipping of the ligature was due to the contraction of the muscular tissue of the pedicle. To prevent this the pedicle should be transfixed before ligation, for which he always used a sharp needle, spreading out the pedicle to prevent the possibility of puncturing a vessel. Many cases supposed to be cured by tapping and drainage are really only temporarily relieved.

Medical Jurisprudence and Toxicology.

Carbolic Acid Poisoning through the previously Healthy Skin.

Dr. EDWARD ZILLNER, assistant to the Professor of Medical Jurisprudence at Vienna (*Wiener Med. Wochenschrift*, No. 47, 1879) relates the following interesting case: A young child of fourteen months was trying to raise itself up in the street by means of a can belonging to one of the municipal "disinfecting officers," which contained about a litre of 30 to 40 per cent. carbolic acid solution. In so doing it upset the contents of the can over itself, so that nearly the whole of the front of its trunk and extremities were wetted by the acid. The accident happened on June 30 at 3 P. M., and the child was almost immediately after taken to the hospital. It was deeply comatose, with a very weak, uncountable pulse. There were abundant rales over both lungs. It died without recovering consciousness at 4 A. M., July 1. No smell of carbolic acid could be detected in any of the organs of the body at the autopsy, but the urine contained whitish flocculi, and on the second day had turned of a dirty brown colour, while Professor Ludwig detected carbolic acid in it on chemical analysis. The coma could not be accounted for by any injury to the head or any disease of the brain. The bronchial catarrh appears to have been an affair of some standing, the child being also rickety and delicate. Dr. Zillner gave it as his decided opinion—a judicial inquiry having been opened—that the carbolic acid was the cause of death; but a second physician ascribed the latter to the bronchitis. A third, however, appointed as arbiter, entirely agreed, as most people would probably be inclined to do, with Dr. Zillner. The case is nearly, if not quite, unique as an example of fatal carbolic acid poisoning in an individual whose skin was previously quite healthy. A very similar case has been published by Sandwell (*British Medical Journal*, October 8, 1870), but the child was ill at the time with pleurisy and intestinal catarrh, and may have succumbed to them. Dr. Wicke, of Göttingen (*Deutsche Klinik*, 1869, Nos. 19 and 20), records a case in which a patient died a few minutes after carbolic acid had been painted on his scalp, but here the skin had been affected for twelve years with favus. One point in Zillner's case deserves notice—the large amount of ante-mortem coagulation of the blood. As a rule, the blood remains fluid after carbolic acid poisoning. The only exceptions appear to be those cases where, as in Zillner's, the agony is much prolonged.—*Med. Times and Gazette*, Dec. 20, 1879.

MEDICAL NEWS.

The Pathology of Yellow Fever.—The Havana Yellow Fever Commission of the National Board of Health have just issued their preliminary report, from which we learn that the microscopical investigations of the Commission lead them to the belief that in yellow fever the white blood corpuscles undergo a process of fatty degeneration, but they failed to find in the blood any organism which can be considered pathognomonic of the disease.

From this report it also appears that yellow fever must be considered as endemic in the Island of Cuba, and that for many years it has prevailed annually in the principal ports. The facts presented do not confirm the theory of the spontaneous origin of the yellow fever poison on board ships, and make it improbable that the cleansing of the harbor of Havana and the constant removal of its waters, however desirable, would prevent the infection of the shipping at this port.

Health Reports.—Deaths from smallpox have been reported in New York, Philadelphia, Washington, Chicago, and San Antonio. The disease has existed for some time along our borders—for example, at Montreal, St. Johns, N. B., Havana, and Matamoras—and in the principal cities of Europe. Upwards of 250 deaths have been reported at Paris since August 21st.

Measles are very prevalent in New York, Brooklyn, and Chicago. *Scarlet fever*, although declining, is widely spread through the Atlantic States as far south as Baltimore, and extends to the Mississippi in the country north of the Potomac and Ohio rivers. The largest mortality prevails at Providence, Baltimore, and Cleveland. *Diphtheria* and *croup* find a number of victims in Boston, New York, Brooklyn, Philadelphia, Chicago, and Kansas City.

Relation of Diarrhœa to Temperature.—The unusually cold and damp summer experienced in Great Britain last year has resulted in an extraordinary reduction in the number of deaths from diarrhœa. We see it stated that at Birmingham, where the mean temperature was 2.6° lower than that for the corresponding period of 1878, there were only 81 deaths from diarrhœa last July, August, and September, against 534 in those months in 1878.

A Confession of Faith.—The *Lancet* (Dec. 20, 1879), in a carefully written editorial, announces its conversion to antiseptic surgery, and makes the following avowal of faith: "After the most careful consideration of the subject, we believe Listerism has undoubtedly diminished the mortality and the danger to patients situated under unfavourable hygienic conditions, after surgical operations; and holding this belief, we may argue from the greater to the less, and assert our conviction that this same system is capable of preventing septo-pyæmia in patients under almost all circumstances. We hold therefore that Listerism is destined to be the surgery of the future; for, however difficult the details or length of time required to carry out these principles in individual cases, it must and will prevail, because it guards our patients from unquestionable dangers."

Deaths from the Inhalation of Ether.—The *Canada Lancet* (December, 1879) reports a case of sudden death from the inhalation of ether, which occurred at

Aylmer, Ont., a few weeks previously. Scarcely an ounce of ether was administered for the purpose of extracting a tooth. The coroner's jury found that the death was due to paralysis of the heart caused by the inhalation of ether. Another case is reported at Providence (*Boston Med. and Surg. Journ.*, Jan. 15, 1880), in which the ether was given to facilitate the diagnosis of an injury to the hip. After inhalation for about fifteen minutes the man suddenly ceased to breathe. The autopsy showed effusion of serum beneath the arachnoid, valvular disease of heart, and cystic degeneration of the kidneys.

Deodorization of Iodoform.—According to M. Constantin Paul, iodoform can be deprived of its odour by essence of mint, six drops sufficing to deodorize thirty grammes of iodoform. Dr. Lindemann prefers oil of cloves, or balsam of Peru.

Recommendations to Congress of the National Academy of Sciences in reference to the National Board of Health.

In accordance with the Act establishing the National Board of Health, the National Academy of Sciences appointed a committee, with power to act, to confer with the National Board of Health as to a plan for a permanent public health organization. The conference was held at Washington in the latter part of December, and resulted in the following recommendations to Congress:—

1. That for the present no change be made in the plan of organization of the National Board of Health.

2. That the Board be authorized to confer on an Executive Committee such of its powers and duties as it may deem advisable.

3. That the Board continue its special investigations; and that, in addition to those already undertaken, there should be included investigations upon cholera, malaria, typhoid and typho-malarial fevers, diphtheria, and cerebro-spinal meningitis. There should also be carried on sanitary surveys of places remarkably unhealthy or liable to become so.

4. That the National Board of Health should take steps to secure, as far as possible throughout the country, uniformity in the methods of collecting and reporting vital statistics; and that, to this end, it should call a convention of representatives of United States, State, and local authorities engaged in the preparation of such statistics.

5. That the Act to prevent the introduction of contagious and infectious diseases into the United States should be so amended, that, in order to inforce the penalties provided for vessels which shall enter ports of the United States in violation thereof, it shall not be necessary to show that the port of departure was at the precise time of departure of such vessel actually infected with contagious or infectious disease; nor that ten days' official promulgation in the port from which said vessel sailed should have been effected.

6. That the National Board or its Executive Committee shall report to the President when any given city or locality is considered to be dangerously infected; and that, upon the official publication by the President of such report, the transportation of goods or persons from the place thus proclaimed as dangerously infected into other States shall be forbidden, under penalties to be imposed under the jurisdiction of United States courts, unless such transportation is carried on in accordance with the rules and regulations approved by the National Board of Health.

7. That the President be authorized to call an international sanitary council, to meet at Washington, D. C., at which the several powers having jurisdiction of ports likely to be infected with yellow fever shall be invited to send delegates for the purpose of securing an international system of notification as to the actual

sanitary condition of the ports and places under the jurisdiction of such powers, and of all vessels sailing therefrom.

8. That the National Board of Health at once establish quarantine stations near the mouth of Chesapeake Bay and in the vicinity of Ship Island in the Gulf of Mexico; that these stations be provided with all the buildings, wharves, boats, and apparatus for properly treating an infected ship, including passengers, crew, and freight; and that they be kept up and managed by the National Board of Health.

—

Sanitary Convention at Detroit.—The first of a series of sanitary conventions was held at Detroit, on January 7th and 8th, under the auspices of the Michigan State Board of Health. ' A feature of the convention was an exhibition of sanitary appliances with the view of bringing them more prominently to the attention of the public. There was no fee of admission or premium offered for competition.

A number of popular papers on sanitary subjects were read. Dr. V. C. Vaughan, of Ann Arbor, read an interesting paper on "The Contamination of Drinking Water by Infiltration of Organic Matter through the Soil," which elicited from Dr. Kedzie the statement that he had examined a large number of wells in Lansing, where typhoid fever has prevailed to an alarming extent, and in every instance had found the well water contaminated with decomposing organic matter; and that in Grand Rapids, where one of the cemeteries is right in the midst of the city, underlaid with a bed of impervious clay, sloping towards the wells on a certain street, every family in the vicinity had had the typhoid fever, from which many had died.

Papers were also read on "Light in the Public Schools," "Prevention of Pulmonary Consumption," "Ventilation," "School Hygiene," "Water Filters," "Adulteration of Food," "Cooking Schools," "Cosmetics," and other subjects.

This plan of arousing an interest in, and of popularizing, sanitary knowledge, which has been initiated by the Michigan Health Board, is admirably calculated to effect the object, and is worthy of general adoption.

—

American Public Health Association.—At the seventh annual meeting, held at Nashville, in November last, the following officers were elected for the ensuing year: President, Dr. John S. Billings, U.S.A. Vice-Presidents, Drs. Samuel Choppin, of Louisiana, and R. C. Kedzie, of Michigan. Treasurer, Dr. J. B. Lindsley, of Tennessee. Executive Committee, Drs. C. B. White, of Louisiana; J. C. Cabell, of Virginia; E. M. Hunt, of New Jersey; D. D. Plunkett, of Tennessee; C. F. Folsom, of Massachusetts; and A. L. Gihon, U.S.N. The next meeting will be held at New Orleans.

—

Louisiana State Medical Society.—The next annual meeting of this Society will be held at New Orleans, on the 31st of March.

—

The Lieutenant-Governor of Quebec.—Theodore Robitaille, M.D., has been appointed Lieutenant-Governor of Quebec, and the medical schools of Montreal have forwarded to him congratulatory addresses on his elevation to the highest office in the Province.

—

Professor Hebra.—We regret to learn that the health of this distinguished dermatologist does not permit him to lecture this winter. His place is supplied at present by his son-in-law, Prof. Kaposi, the joint editor of his great work on "Diseases of the Skin."

Bequests to the New York Academy of Medicine.—The late Dr. Freeman J. Bumstead bequeathed his entire medical library, which is particularly rich in works on venereal diseases, to the New York Academy of Medicine. The late Dr. Oliver White, of New York, recently deceased, left five hundred dollars to the same Society.

Heavy Damages for Accident to a Medical Man.—Dr. C. D. Phillips, a London practitioner, recently brought an action against the London and South-western Railway Co. for damages sustained while travelling on the company's road, when the train came in collision with an engine standing on the line, which resulted in fracture of two of his ribs and severe injury to the spinal cord, causing partial paralysis, dyspnœa, and much pain. The opinion of eminent medical experts differed; some thinking that recovery was impossible, others that in three or four years he might recover to some extent. Dr. Phillips showed that his practice for the three preceding years had yielded him £6000 a year. He was awarded £7000 damages, and a new trial was granted on the ground that the damages were inadequate. In the second trial Lord Chief-Justice Coleridge charged the jury that the compensation was to be what they thought fair, and stated that in this accident he considered the defendants singularly free from all moral blame. The jury gave a verdict of £16,000 damages. Again a new trial was applied for on the ground that the damages were excessive, but was refused. It is intimated that the case will be appealed to the House of Lords.

This case has particular interest on this side of the Atlantic, owing to the very inadequate awards which are usually obtained under similar circumstances in our courts. In the State of Pennsylvania the maximum damages in any event obtainable in case of *death* is limited by Act of Assembly to the insignificant sum of $5000, or one-sixteenth the amount obtained in the English case of accident reported above.

Literary Notes.

Changes in Medical Journals.—The January number of the *New York Medical Journal* appears under the editorship of Dr. Frank P. Foster, who has had more or less to do with medical journalism for some years past. In his introductory he gives the plan on which he proposes to conduct his journal, and which should result to the satisfaction of his readers and to the prosperity of the periodical. Dr. Hunter's management was able and always evinced a liberal and honourable spirit, and in his retirement he carries with him the esteem of his co-labourers.

New Medical Journals.—*The Practitioner* is a monthly, issued at Baltimore, under the editorial management of Drs. Harvey L. Byrd and Basil M. Wilkenson. The first number of 52 pages contains several original communications, some selections, and several editorials. The journal includes dentistry within its scope. We regret that its editors should have considered it desirable to give it the name which has long belonged to an excellent London periodical, and virtually the same as that of three other journals in this country.

The Alienist and Neurologist is a new quarterly devoted to psychiatry and neurology, and is edited by Dr. C. H. Hughes, of St. Louis. The first number presents an attractive appearance, and contains original communications from Drs. Curwen, Beard, Hughes, Dean, Stevens, Pliny Earle, and Allan McLane Hamilton. Selections and editorials complete the make-up of the journal.

The Kansas Medical Index is a small monthly of twenty-nine pages, issued at Fort Scott, under the editorial charge of Dr. F. F. Dickman, who is "persuaded that there is room and use for a live medical journal in the State of Kansas," and he proposes that the "Index" shall occupy the field.

The *Chicago Medical Gazette* is a neat-looking, 24-page quarto, published semi-monthly, and edited by Dr. E. C. Dudley. Its contents are varied, and the first number is well illustrated.

The College and Clinical Record is a 16-page monthly, conducted in the interests of the Alumni and students of the Jefferson Medical College, Philadelphia, and is edited by Drs. R. J. Dunglison and Frank Woodbury. Its object is to convey "the most reliable intelligence of current affairs at the Jefferson Medical College" and to furnish "a means of intercourse between graduates of the school." It will also contain reports of the Jefferson clinics, the introductory and valedictory addresses, etc. The first number presents a very attractive appearance.

The Annals of the Anatomical and Surgical Society is a monthly journal edited by Dr. Charles Jewett, and is the organ of the Brooklyn Anatomical and Surgical Society. It is beautifully printed on heavy toned paper, with wide margins. The initial number contains a valuable paper on "Cerebral Anatomy with special reference to the form of the Corpus Striatum," by Prof. Dalton, and a description of some specimens of "double monsters" in the museum of the society. The journal is published by G. P. Putnam's Sons, New York.

After a suspension of eight years, Dr. Greensville Dowell has recommenced the publication of the *Galveston Medical Journal*, assisted by Drs. J. F. Y. Paine and T. J. Heard.

Book Announcements.—Mr. H. C. Lea has now ready a translation of Cornil and Ranvier's "Manual of Pathological Histology," by Drs. E. O. Shakespeare and J. Henry C. Simes; he also announces a "Handbook of the Principles and Practice of Medicine," based upon Husband's Handbook of Practice, by Frank Woodbury, M.D., Physician to the German Hospital, Philadelphia; and "A Manual of the Diseases Peculiar to Women," by Dr. James R. Chadwick, of Boston. The second volume of Hartshorne's edition of Reynolds's "System of Medicine" is now ready for delivery to subscribers. In a few weeks will be published Dr. Reichert's edition of Foster's "Physiology," in which the editor's additions consist of a concise summary of structural physiology, with numerous illustrations.

Messrs. Wm. Wood & Co. announce the following new works to be published in their "Library of Standard Medical Authors," for 1880. "Venereal Diseases," by Dr. E. L. Keyes, of New York; "A Treatise on the Continued and Periodical Fevers," by Dr. James C. Wilson, of Philadelphia; a translation of "A Treatise on Foreign Bodies in Surgical Practice." by Dr. Alfred Poulet, Inspector at Val-de-Grace; "Diagnosis and Treatment of Diseases of the Ear," by Dr. Albert H. Buck, of New York; a translation of Trousseau and Pidoux's "Therapeutics;" a Treatise on "Common Forms of Menstrual Nervous Diseases," by Dr. L. Putzel, of New York; "Memoir Surgical Gynæcology," by Dr. Paul F. Munde, of New York; and a "Manual of Diseases and Deformities of the Joints," by Dr. Leroy M. Yale, of New York.

D. Appleton & Co. have in preparation a "Manual of Gynæcological Operations," by Dr. James B. Hunter, Surgeon to the New York State Woman's Hospital.

Smith, Elder & Co. announce a "Manual of Practical and Applied Anatomy," including human morphology, by H. A. Reeves, F.R.C.S., late Demonstrator of Anatomy at the London and Middlesex Hospitals.

The New Sydenham Society has resolved to reprint the classical work on "Diseases of the Chest," by the late Dr. William Stokes, of Dublin. The editor of the work will be Dr. Alfred Hudson, Regius Professor of Physic in the University of Dublin; and there is some reason to hope that the volume will contain a biography of Dr. Stokes from the pen of a near relative. The first volume of the Society's series for 1880 will be Vol. V. of Hebra on "Diseases of the Skin," translated by Mr. Warren Tay.

Herr Enke, of Stuttgart, has issued the prospectus of a new surgical work which is being published under the title of "Deutsche Chirurgie," and is edited by Professor Billroth, of Vienna, and Professor Lücke, of Strasburg. The work is being published in parts, each complete in itself as to paging and index; and any part can be bought apart from the others. When finished it will form a perfect text-book of surgery as represented by German surgeons; and from the eminence of its contributors it promises to be one of the best publications of the kind (if not *the* best) in any language. From the long list of subjects which have been assigned to different writers, we here give a few of the most important. Professor Recklinghausen treats of disturbances of the circulation and of nutrition, Professor Kaposi of syphilis, Professor Bruns of fractures, Professor Volkmann of diseases of the bones and joints; Professor Lücke takes up diseases of the thyroid gland, Professor Billroth those of the mamma; Professor Nussbaum has allotted to him injuries of the abdomen, Professor Esmarch diseases and injuries of the anus and rectum; Professor Mass has the sections on surgical diseases of the bladder and kidneys, and Professor Olshausen those of the ovaries. The same house announces the "Archiv für Kinderheilkunde," to be edited by Drs. A. Baginsky, M. Herz, and A. Monti.

—

Obituary Record.—At New York, on the 28th of November, in the fifty-fourth year of his age, Freeman J. Bumstead, M.D., President of the New York County Medical Society and late Professor of Venereal Diseases in the College of Physicians and Surgeons, New York.

Dr. Bumstead was a native of Boston, graduated in the Arts at Williams College, and in Medicine at Harvard University. He also studied in the hospitals of London and Paris, and was House-Surgeon at the Massachusetts General Hospital. In 1852 he settled in New York, and entered upon the practice of medicine. In 1858 he was appointed Professor of Venereal Diseases in the College of Physicians and Surgeons.

Dr. Bumstead is best known to the profession by his classical work on Venereal Diseases, which was first published in 1861, and has just reached a fourth edition, the last proof-sheets of which were read in the beginning of his fatal illness.

—— In this city, on the 9th of December, B. Lincoln Ray, M.D., aged 43 years.

Dr. Ray was a frequent contributor to the Review Department of the *American Journal*, and his scholarly style and impartial criticism always rendered his writings attractive. His death is deeply lamented by a large circle of friends.

—— At Cannes, on the 2d of December, J. Soelberg Wells, M.D., F.R.C.S. Eng., Professor of Ophthalmology in King's College, London.

Mr. Wells received his degree of M.D. from the University of Edinburgh, after which he spent four years at the medical schools of Paris, Berlin, and Vienna, and then, having selected the diseases of the eye for his specialty, he studied ophthalmology under Graefe, Donders, and Helmholtz. In 1867 he received an appointment on the Staff of the Royal Ophthalmic Hospital, Moorfields. Possessed of natural abilities and good education, Mr. Wells soon won for himself a leading position among the ophthalmologists of London, and enjoyed a rich and select clientèle. In 1869 he published his elaborate "Treatise on the Diseases of the Eye and their Treatment," which has passed through three editions in England and two in this country, and enjoys the enviable reputation of being the best systematic work on the subject in the English language.

HENRY C. LEA'S

(LATE LEA & BLANCHARD'S)

CLASSIFIED CATALOGUE

OF

MEDICAL AND SURGICAL PUBLICATIONS.

In asking the attention of the profession to the works advertised in the following ages, the publisher would state that no pains are spared to secure a continuance of e confidence earned for the publications of the house by their careful selection and curacy and finish of execution.

The printed prices are those at which books can generally be supplied by booksellers roughout the United States, who can readily procure for their customers any works t kept in stock. Where access to bookstores is not convenient, books will be sent mail post-paid on receipt of the price, and as the limit of mailable weight has been moved, no difficulty will be experienced in obtaining through the post-office any rk in this catalogue. No risks, however, are assumed either on the money or e books, and no publications but my own are supplied, so that gentlemen will in st cases find it more convenient to deal with the nearest bookseller.

An Illustrated Catalogue, of 64 octavo pages, handsomely printed, will be forrded by mail, post-paid, on receipt of ten cents. HENRY C. LEA.

No. 706 and 708 Sansom St., Philadelphia, February, 1880.

INCREASED INDUCEMENT FOR SUBSCRIBERS TO

E AMERICAN JOURNAL OF THE MEDICAL SCIENCES.

TWO MEDICAL JOURNALS, containing nearly 2000 LARGE PAGES,

Free of Postage, for FIVE DOLLARS Per Annum.

TERMS FOR 1880.

E American Journal of the Medical Sciences, published quarterly (1150 pages per annum), with
E Medical News and Abstract, monthly (768 pp. per annum),
} Five Dollars per annum, in advance

SEPARATE SUBSCRIPTIONS TO

The American Journal of the Medical Sciences, when not paid for in advance, Five Dollars.

The Medical News and Abstract, free of postage, in advance, Two Dollars and a half.

⁂ Advance-paying subscribers can obtain at the close of the year cloth covers, lettered, for each volume of the Journal (two annually), and of the News and stract (one annually), free by mail, by remitting ten cents for each cover.

It will thus be seen that for the moderate sum of Five Dollars in advance, e subscriber will receive, free of postage, the equivalent of three or four large tavo volumes, stored with the choicest matter, original and selected, that can furnished by the medical literature of both hemispheres. Thus taken tother, the "Journal," and the "News and Abstract" combine the advantages of e elaborate preparation that can be devoted to the Quarterly with the prompt nveyance of intelligence by the Monthly; while, the whole being under a single itorial supervision, the subscriber is secured against the duplication of matter evitable when periodicals from different sources are taken together.

The periodicals thus offered at this unprecedented rate are universally known for

---

For "The Obstetrical Journal," see p. 24.)

their high professional standing.

I.

THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES,

Edited by I. MINIS HAYS, M.D.,

for more than half a century has maintained its position in the front rank of the medical literature of the world. Cordially supported by the profession of America, it circulates wherever the language is read, and is universally regarded as a national exponent of American medicine—a position to which it is entitled by the distinguished names from every section of the Union which are to be found among its collaborators.* It is issued quarterly, in January, April, July, and October, each number containing about three hundred octavo pages, appropriately illustrated wherever necessary. A large portion of this space is devoted to Original Communications, embracing papers from the most eminent members of the profession throughout the country.

Following this is the Review Department, containing extended reviews by competent writers of prominent new works and topics of the day, together with numerous elaborate Analytical and Bibliographical Notices, giving a fairly complete survey of medical literature.

Then follows the Quarterly Summary of Improvements and Discoveries in the Medical Sciences, classified and arranged under different heads, and furnishing a digest of medical progress, abroad and at home.

Thus during the year 1878 the "Journal" contained 77 Original Communications, mostly elaborate in character, 133 Reviews and Bibliographical Notices, and 255 articles in the Quarterly Summaries, illustrated with 48 maps and wood engravings.

That the efforts thus made to maintain the high reputation of the "Journal" are successful, is shown by the position accorded to it in both America and Europe as a leading organ of medical progress:—

This is universally acknowledged as the leading American Journal, and has been conducted by Dr. Hays alone until 1869, when his son was associated with him. We quite agree with the critic, that this journal is second to none in the language, and cheerfully accord to it the first place, for nowhere shall we find more able and more impartial criticism, and nowhere such a repertory of able original articles. Indeed, now that the "British and Foreign Medico-Chirurgical Review" has terminated its career, the American Journal stands without a rival.—*London Med. Times and Gazette*, Nov. 24, 1877.

The best medical journal on the continent —*Boston Med and Surg. Journal*, April 17, 1879.

The present number of the American Journal is an exceedingly good one, and gives every promise of maintaining the well-earned reputation of the review Our venerable contemporary has our best wishes, and we can only express the hope that it may continue its work with as much vigor and excellence for the next fifty years as it has exhibited in the past. —*London Lancet*, Nov. 24, 1877.

The Philadelphia Medical and Physical Journal issued its first number in 1820, and, after a brilliant career, was succeeded in 1827 by the American Journal of the Medical Sciences, a periodical of world-wide reputation; the ablest and one of the oldest periodicals in the world—a journal which has an unsullied record.—*Gross's History of American Med. Literature*, 1876.

It is universally acknowledged to be the leading American medical journal, and, in our opinion, is second to none in the language.—*Boston Med. and Surg. Journal*, Oct. 1877.

This is the medical journal of our country to which the American physician abroad will point with the greatest satisfaction, as reflecting the state of medical culture in his country. For a great many years it has been the medium through which our ablest writers have made known their discoveries and observations —*Address of L. P. Yandell, M.D., before International Med. Congress*, Sept. 1876.

And that it was specifically included in the award of a medal of merit to the Publisher in the Vienna Exhibition in 1873.

The subscription price of the "American Journal of the Medical Sciences" has never been raised during its long career. It is still Five Dollars per annum; and when paid for in advance, the subscriber receives in addition the "Medical News and Abstract," making in all nearly 2000 large octavo pages per annum, free of postage.

II.

THE MEDICAL NEWS AND ABSTRACT.

Thirty-seven years ago the "Medical News" was commenced as a monthly to convey to the subscribers of the "American Journal" the clinical instruction and current information which could not be accommodated in the Quarterly. It consisted of sixteen pages of such matter, together with sixteen more known as the Library Department and devoted to the publishing of books. With the increased progress of science, however, this was found insufficient. and some years since another periodical. known as the "MONTHLY ABSTRACT," was started, and was furnished at a moderate price to subscribers to the "AMERICAN JOURNAL." These two monthlies will hereafter be consolidated, under the title of "THE MEDICAL NEWS AND ABSTRACT," and will be furnished *free of charge* in connection with the "AMERICAN JOURNAL."

---

* Communications are invited from gentlemen in all parts of the country. Elaborate articles inserted by the Editor are paid for by the Publisher.

The "NEWS AND ABSTRACT" will consist of 64 pages monthly, in a neat cover. It will contain a CLINICAL DEPARTMENT in which will be continued the series of ORIGINAL AMERICAN CLINICAL LECTURES, by gentlemen of the highest reputation throughout the United States, together with a choice selection of foreign Lectures and Hospital Notes and Gleanings. Then will follow the MONTHLY ABSTRACT, systematically arranged and classified, and presenting five or six hundred articles yearly; and each number will conclude with a NEWS DEPARTMENT, giving current professional intelligence, domestic and foreign, the whole fully indexed at the close of each volume, rendering it of permanent value for reference.

As stated above, the subscription price to the "NEWS AND ABSTRACT" will be Two Dollars and a Half per annum, invariably in advance, at which rate it will rank as one of the cheapest medical periodicals in the country. But it will also be furnished, free of all charge, in commutation with the "AMERICAN JOURNAL OF THE MEDICAL SCIENCES," to all who remit FIVE DOLLARS in advance, thus giving to the subscriber, for that very moderate sum, a complete record of medical progress throughout the world, in the compass of about two thousand large octavo pages.

In this effort to furnish so large an amount of practical information at a price so unprecedentedly low, and thus place it within the reach of every member of the profession, the publisher confidently anticipates the friendly aid of all who feel an interest in the dissemination of sound medical literature. He trusts, especially, that the subscribers to the "AMERICAN MEDICAL JOURNAL" will call the attention of their acquaintances to the advantages thus offered, and that he will be sustained in the endeavor to permanently establish medical periodical literature on a footing of cheapness never heretofore attempted.

PREMIUM FOR OBTAINING NEW SUBSCRIBERS TO THE "JOURNAL."

Any gentleman who will remit the amount for two subscriptions for 1880, one of which at least must be for a *new subscriber*, will receive as a PREMIUM, free by mail, a copy of any one of the following recent works:

"BARNES'S MANUAL OF MIDWIFERY" (see p. 24),
"TILBURY FOX'S EPITOME OF DISEASES OF THE SKIN," new edition, just ready, (see p. 18)
"FOTHERGILL'S ANTAGONISM OF MEDICINES" (see p. 16),
"HOLDEN'S LANDMARKS, MEDICAL AND SURGICAL" (see p. 6),
"BROWNE ON THE USE OF THE OPHTHALMOSCOPE" (see p. 29),
"FLINT'S ESSAYS ON CONSERVATIVE MEDICINE" (see p. 15),
"STURGES'S CLINICAL MEDICINE" (see p. 14),
"SWAYNE'S OBSTETRIC APHORISMS," new edition (see p. 21),
"TANNER'S CLINICAL MANUAL" (see p. 5),
"WEST ON NERVOUS DISORDERS OF CHILDREN" (see p. 20).

⁂ Gentlemen desiring to avail themselves of the advantages thus offered will do well to forward their subscriptions at an early day, in order to insure the receipt of complete sets for the year 1880.

☞ The safest mode of remittance is by bank check or postal money order, drawn to the order of the undersigned. Where these are not accessible, remittances for the "JOURNAL" may be made at the risk of the publisher, by forwarding in REGISTERED letters. Address,

HENRY C. LEA, Nos. 706 and 708 SANSOM ST., PHILADELPHIA, PA.

their high professional standing.

I.

THE AMERICAN JOURNAL OF THE MEDICAL SCIENCES,

EDITED BY I. MINIS HAYS, M.D.,

for more than half a century has maintained its position in the front rank of t medical literature of the world. Cordially supported by the profession of Americ it circulates wherever the language is read, and is universally regarded as a natio exponent of American medicine—a position to which it is entitled by the disti guished names from every section of the Union which are to be found among i collaborators.* It is issued quarterly, in January, April, July, and October, ea number containing about three hundred octavo pages, appropriately illustrat wherever necessary. A large portion of this space is devoted to Original Comm nications, embracing papers from the most eminent members of the professi throughout the country.

Following this is the REVIEW DEPARTMENT, containing extended reviews by co petent writers of prominent new works and topics of the day, together with num ous elaborate Analytical and Bibliographical Notices, giving a fairly complete s vey of medical literature.

Then follows the QUARTERLY SUMMARY OF IMPROVEMENTS AND DISCOVERIES THE MEDICAL SCIENCES, classified and arranged under different heads, and furni ing a digest of medical progress, abroad and at home.

Thus during the year 1878 the "JOURNAL" contained 77 Original Communic tions, mostly elaborate in character, 133 Reviews and Bibliographical Notices, a 255 articles in the Quarterly Summaries, illustrated with 48 maps and wood gravings.

That the efforts thus made to maintain the high reputation of the "JOURNAL" successful, is shown by the position accorded to it in both America and Europe a leading organ of medical progress:—

This is universally acknowledged as the leading American Journal, and has been conducted by Dr. Hays alone until 1869, when his son was associated with him. We quite agree with the critic, that this journal is second to none in the language, and cheerfully accord to it the first place, for nowhere shall we find more able and more impartial criticism, and nowhere such a repertory of able original articles. Indeed, now that the "British and Foreign Medico-Chirurgical Review" has terminated its career, the American Journal stands without a rival.—*London Med. Times and Gazette*, Nov. 24, 1877.

The best medical journal on the continent.—*Boston Med. and Surg. Journal*, April 17, 1879.

The present number of the American Journal is an exceedingly good one, and gives every promise of maintaining the well earned reputation of the review. Our venerable contemporary has our best wishes, and we can only express the hope that it may continue its work with as much vigor and excellence for the next fifty years as it has exhibited in the past. —*London Lancet*, Nov. 24, 1877.

The Philadelphia Medical and Physical Jou issued its first number in 1820, and, after a brill career, was succeeded in 1827 by the Ameri Journal of the Medical Sciences, a periodical world-wide reputation; the ablest and one of oldest periodicals in the world—a journal which an unsullied record.—*Gross's History of Ameri Med. Literature*, 1876.

It is universally acknowledged to be the lead American medical journal, and, in our opinion second to none in the language.—*Boston Med. Surg. Journal*, Oct. 1877.

This is the medical journal of our country to wh the American physician abroad will point with greatest satisfaction, as reflecting the state of medi culture in his country. For a great many year has been the medium through which our ablest w ers have made known their discoveries and obse tions.—*Address of L. P. Yandell, M.D., before In national Med. Congress*, Sept. 1876.

And that it was specifically included in the award of a medal of merit to the Publis in the Vienna Exhibition in 1873.

The subscription price of the "AMERICAN JOURNAL OF THE MEDICAL SCIENCES" never been raised during its long career. It is still FIVE DOLLARS per annum; when paid for in advance, the subscriber receives in addition the "MEDICAL NEWS ABSTRACT," making in all nearly 2000 large octavo pages per annum, free of posta

II.

THE MEDICAL NEWS AND ABSTRACT.

Thirty-seven years ago the "MEDICAL NEWS" was commenced as a monthly convey to the subscribers of the "AMERICAN JOURNAL" the clinical instruction urrent information which could not be accommodated in the Quarterly. It con- isted of sixteen pages of such matter, together with sixteen more known as the ibrary Department and devoted to the publishing of books. With the increased gress of science, however, this was found insufficient, and some years since an- her periodical, known as the "MONTHLY ABSTRACT," was started, and was fur- hed at a moderate price to subscribers to the "AMERICAN JOURNAL." These monthlies will hereafter be consolidated, under the title of "THE MEDICAL WS AND ABSTRACT," and will be furnished *free of charge* in connection with the AMERICAN JOURNAL."

---

* Communications are invited from gentlemen in all parts of the country. Elaborate articles ins by the Editor are paid for by the Publisher.

The "NEWS AND ABSTRACT" will consist of 64 pages monthly, in a neat cover. will contain a CLINICAL DEPARTMENT in which will be continued the series of IGINAL AMERICAN CLINICAL LECTURES, by gentlemen of the highest reputation oughout the United States, together with a choice selection of foreign Lectures d Hospital Notes and Gleanings. Then will follow the MONTHLY ABSTRACT, sys- matically arranged and classified, and presenting five or six hundred articles yearly; d each number will conclude with a NEWS DEPARTMENT, giving current profes- al intelligence, domestic and foreign, the whole fully indexed at the close of volume, rendering it of permanent value for reference.

As stated above, the subscription price to the "NEWS AND ABSTRACT" will be Dollars and a Half per annum, invariably in advance, at which rate it will rank e of the cheapest medical periodicals in the country. But it will also be fur- hed, free of all charge, in commutation with the "AMERICAN JOURNAL OF THE ICAL SCIENCES," to all who remit FIVE DOLLARS in advance, thus giving to the scriber, for that very moderate sum, a complete record of medical progress ughout the world, in the compass of about two thousand large octavo pages.

In this effort to furnish so large an amount of practical information at a price so precedentedly low, and thus place it within the reach of every member of the fession, the publisher confidently anticipates the friendly aid of all who feel an erest in the dissemination of sound medical literature. He trusts, especially, that subscribers to the "AMERICAN MEDICAL JOURNAL" will call the attention of their aintances to the advantages thus offered, and that he will be sustained in the eavor to permanently establish medical periodical literature on a footing of apness never heretofore attempted.

REMIUM FOR OBTAINING NEW SUBSCRIBERS TO THE "JOURNAL."

Any gentleman who will remit the amount for two subscriptions for 1880, one of ch at least must be for a *new subscriber*, will receive as a PREMIUM, free by mail, a of any one of the following recent works:

"BARNES'S MANUAL OF MIDWIFERY" (see p. 24),
"TILBURY FOX'S EPITOME OF DISEASES OF THE SKIN," new edition, just ready, (see p. 18)
"FOTHERGILL'S ANTAGONISM OF MEDICINES" (see p. 16),
"HOLDEN'S LANDMARKS, MEDICAL AND SURGICAL" (see p. 6),
"BROWNE ON THE USE OF THE OPHTHALMOSCOPE" (see p. 29),
"FLINT'S ESSAYS ON CONSERVATIVE MEDICINE" (see p. 15),
"STURGES'S CLINICAL MEDICINE" (see p. 14),
"SWAYNE'S OBSTETRIC APHORISMS," new edition (see p. 21),
"TANNER'S CLINICAL MANUAL" (see p. 5),
"WEST ON NERVOUS DISORDERS OF CHILDREN" (see p. 20).

⁂ Gentlemen desiring to avail themselves of the advantages thus offered will do ell to forward their subscriptions at an early day, in order to insure the receipt of mplete sets for the year 1880.

☞ The safest mode of remittance is by bank check or postal money order, drawn to the order of the undersigned. Where these are not accessible, remittances for the JOURNAL" may be made at the risk of the publisher, by forwarding in REGISTERED tters. Address,

HENRY C. LEA, Nos. 706 and 708 SANSOM ST., PHILADELPHIA, PA.

GRAY (HENRY), F.R.S.,

Lecturer on Anatomy at St. George's Hospital, London.

ANATOMY, DESCRIPTIVE AND SURGICAL. The Drawings by H. V. CARTER, M.D., and Dr. WESTMACOTT. The Dissections jointly by the AUTHOR and Dr. CARTER. With an Introduction on General Anatomy and Development by T. HOLMES, M.A., Surgeon to St. George's Hospital. A new American, from the eighth enlarged and improved London edition. To which is added "LANDMARKS, MEDICAL AND SURGICAL," by LUTHER HOLDEN, F.R.C.S., author of "Human Osteology," "A Manual of Dissections," etc. In one magnificent imperial octavo volume of 983 pages, with 522 large and elaborate engravings on wood. Cloth, $6; leather, raised bands, $7. (*Just Ready.*)

The author has endeavored in this work to cover a more extended range of subjects than is customary in the ordinary text-books, by giving not only the details necessary for the student, but also the application of those details in the practice of medicine and surgery, thus rendering it both a guide for the learner, and an admirable work of reference for the active practitioner. The engravings form a special feature in the work, many of them being the size of nature, nearly all original, and having the names of the various parts printed on the body of the cut, in place of figures of reference, with descriptions at the foot. They thus form a complete and splendid series, which will greatly assist the student in obtaining a clear idea of Anatomy, and will also serve to refresh the memory of those who may find in the exigencies of practice the necessity of recalling the details of the dissecting room; while combining, as it does, a complete Atlas of Anatomy, with a thorough treatise on systematic, descriptive, and applied Anatomy, the work will be found of essential use to all physicians who receive students in their offices, relieving both preceptor and pupil of much labor in laying the groundwork of a thorough medical education.

Since the appearance of the last American Edition, the work has received three revisions at the hands of its accomplished editor, Mr. Holmes, who has sedulously introduced whatever has seemed requisite to maintain its reputation as a complete and authoritative standard text-book and work of reference. Still further to increase its usefulness, there has been appended to it the recent work by the distinguished anatomist, Mr. Luther Holden—"Landmarks, Medical and Surgical"—which gives in a clear, condensed, and systematic way, all the information by which the practitioner can determine from the external surface of the body the position of internal parts. Thus complete, the work, it is believed, will furnish all the assistance that can be rendered by type and illustration in anatomical study. No pains have been spared in the typographical execution of the volume, which will be found in all respects superior to former issues. Notwithstanding the increase of size, amounting to over 100 pages and 57 illustrations, it will be kept, as heretofore, at a price rendering it one of the cheapest works ever offered to the American profession.

The recent work of Mr Holden, which was noticed by us on p. 53 of this volume, has been added as an appendix, so that, altogether, this is the most practical and complete anatomical treatise available to American students and physicians. The former finds in it the necessary guide in making dissections; a very comprehensive chapter on minute anatomy; and about all that can be taught him on general and special anatomy; while the latter, in its treatment of each region from a surgical point of view, and in the valuable edition of Mr Holden, will find all that will be essential to him in his practice.—*New Remedies*, Aug. 1878.

This work is as near perfection as one could possibly or reasonably expect any book intended as a text-book or a general reference book on anatomy to be. The American publisher deserves the thanks of the profession for appending the recent work of Mr. Holden, "*Landmarks, Medical and Surgical*," which has already been commended as a separate book. The latter work—treating of topographical anatomy—has become an essential to the library of every intelligent practitioner. We know of no book that can take its place, written as it is by a most distinguished anatomist. It would be simply a waste of words to say anything further in praise of Gray's Anatomy, the text-book in almost every medical college in this country, and the daily reference book of every practitioner who has occasion to consult his books on anatomy. The work is simply indispensable, especially this present American edition.—*Va. Med. Monthly*, Sept. 1878.

The addition of the recent work of Mr. Holden, as an appendix, renders this the most practical and complete treatise available to American students, who find in it a comprehensive chapter on minute anatomy, about all that can be taught on general and special anatomy, while its treatment of each region, from a surgical point of view, in the valuable section by Mr. Holden, is all that will be essential to them in practice.—*Ohio Medical Recorder*, Aug. 1878.

It is difficult to speak in moderate terms of this new edition of "Gray." It seems to be as nearly perfect as it is possible to make a book devoted to any branch of medical science. The labors of the eminent men who have successively revised the eight editions through which it has passed, would seem to leave nothing for future editors to do. The addition of Holden's "Landmarks" will make it as indispensable to the practitioner of medicine and surgery as it has been heretofore to the student. As regards completeness, ease of reference, utility, beauty, and cheapness, it has no rival. No student should enter a medical school without it; no physician can afford to have it absent from his library.—*St. Louis Clin. Record*, Sept. 1878.

ALSO FOR SALE SEPARATE—

HOLDEN (LUTHER), F.R.C.S.,

Surgeon to St. Bartholomew's and the Foundling Hospitals.

LANDMARKS, MEDICAL AND SURGICAL. From the 2d London Ed. In one handsome volume, royal 12mo., of 128 pages: cloth, 88 cents. (*Now Ready.*)

HEATH (CHRISTOPHER), F.R.C.S.,

Teacher of Operative Surgery in University College, London.

PRACTICAL ANATOMY: A Manual of Dissections. From the Second revised and improved London edition. Edited, with additions, by W. W. KEEN, M. D., Lecturer on Pathological Anatomy in the Jefferson Medical College, Philadelphia. In one handsome royal 12mo. volume of 578 pages, with 247 illustrations. Cloth, $3 50; leather, $4 00.

A *CENTURY OF AMERICAN MEDICINE*, 1776–1876. By Doctors E. H. Clarke, H. J. Bigelow, S. D. Gross, T. G. Thomas, and J. S. Billings. In one very handsome 12mo. volume of about 350 pages: cloth, $2 25. (*Just Ready.*)

This work appeared in the pages of the American Journal of the Medical Sciences during the year 1876. As a detailed account of the development of medical science in America, by gentlemen of the highest authority in their respective departments, the profession will no doubt welcome it in a form adapted for preservation and reference.

NEILL (JOHN), M.D., and SMITH (FRANCIS G.), M.D.,

Prof. of the Institutes of Medicine in the Univ. of Penna.

AN ANALYTICAL COMPENDIUM OF THE VARIOUS BRANCHES OF MEDICAL SCIENCE; for the Use and Examination of Students. A new edition, revised and improved. In one very large and handsomely printed royal 12mo. volume, of about one thousand pages, with 374 wood-cuts, cloth, $4; strongly bound in leather, with raised bands, $4 75.

HARTSHORNE (HENRY), M.D.,

Professor of Hygiene in the University of Pennsylvania.

A CONSPECTUS OF THE MEDICAL SCIENCES; containing Handbooks on Anatomy, Physiology, Chemistry, Materia Medica, Practical Medicine, Surgery, and Obstetrics. Second Edition, thoroughly revised and improved. In one large royal 12mo. volume of more than 1000 closely printed pages, with 477 illustrations on wood. Cloth, $4 25; leather, $5 00. (*Lately Issued.*)

We can say with the strictest truth that it is the best work of the kind with which we are acquainted. It embodies in a condensed form all recent contributions to practical medicine, and is therefore useful to every busy practitioner throughout our country, besides being admirably adapted to the use of students of medicine. The book is faithfully and ably illustrated.—*Charleston Med. Journ.*, April, 1875

The work is intended as an aid to the medical student, and as such appears to admirably fulfil its object by its excellent arrangement, the full compilation of facts, the perspicuity and terseness of language, and the clear and instructive illustrations in some parts of the work.—*American Journ. of Pharmacy*, Philadelphia, July, 1874.

The volume will be found useful, not only to students, but to many others who may desire to refresh their memories with the smallest possible expenditure of time.—*N. Y. Med. Journal*, Sept. 1874.

The student will find this the most convenient and useful book of the kind on which he can lay his hand.—*Pacific Med. and Surg. Journ.*, Aug. 1874.

This is the best book of its kind that we have ever examined. It is an honest, accurate, and concise compend of medical sciences, as fairly as possible representing their present condition. The changes and the additions have been so judicious and thorough as to render it, so far as it goes, entirely trustworthy. If students must have a conspectus, they will be wise to procure that of Dr. Hartshorne.—*Detroit Rev. of Med. and Pharm.*, Aug. 1874.

The work before us, however, has many redeeming features not possessed by others, and is the best we have seen. Dr. Hartshorne exhibits much skill in condensation. It is well adapted to the physician in active practice, who can give but limited time to the familiarizing of himself with the important changes which have been made since he attended lectures. The manual of physiology has also been improved and gives the most comprehensive view of the latest advances in the science possible in the space devoted to the subject. The mechanical execution of the book leaves nothing to be wished for.—*Peninsular Journal of Medicine*, Sept. 1874.

After carefully looking through this conspectus, we are constrained to say that it is the most complete work, especially in its illustrations, of its kind that we have seen.—*Cincinnati Lancet*, Sept. 1874.

The favor with which the first edition of this Compendium was received, was an evidence of its various excellences. The present edition bears evidence of a careful and thorough revision. Dr. Hartshorne possesses a happy faculty of seizing upon the salient points of each subject, and of presenting them in a concise and yet perspicuous manner.—*Leavenworth Med. Herald*, Oct. 1874.

LUDLOW (J. L.), M.D.

A MANUAL OF EXAMINATIONS upon Anatomy, Physiology, Surgery, Practice of Medicine, Obstetrics, Materia Medica, Chemistry, Pharmacy, and Therapeutics. To which is added a Medical Formulary. Third edition, thoroughly revised and greatly extended and enlarged. With 370 illustrations. In one handsome royal 12mo. volume of 816 large pages, cloth, $3 25; leather, $3 75.

The arrangement of this volume in the form of question and answer renders it especially suitable for the office examination of students, and for those preparing for graduation.

TANNER (THOMAS HAWKES), M.D., &c.

A MANUAL OF CLINICAL MEDICINE AND PHYSICAL DIAGNOSIS. Third American from the Second London Edition. Revised and Enlarged by TILBURY FOX, M. D., Physician to the Skin Department in University College Hospital, &c. In one neat volume small 12mo., of about 375 pages, cloth, $1 50.

*** On page 3, it will be seen that this work is offered as a premium for procuring new subscribers to the "AMERICAN JOURNAL OF THE MEDICAL SCIENCES."

GRAY (HENRY), F.R.S.,

Lecturer on Anatomy at St. George's Hospital, London.

ANATOMY, DESCRIPTIVE AND SURGICAL.

The Drawings
H. V. CARTER, M.D., and Dr. WESTMACOTT. The Dissections jointly by the AUTHOR
Dr. CARTER. With an Introduction on General Anatomy and Development by
HOLMES, M.A., Surgeon to St. George's Hospital. A new American, from the ei
enlarged and improved London edition. To which is added "LANDMARKS, MEDICAL

Ed. In one handsome volume, royal 12mo., of 128 pages: cloth, 88 cents. (*Now Ready.*

HEATH (CHRISTOPHER), F.R.C.S.,

Teacher of Operative Surgery in University College, London.

PRACTICAL ANATOMY: A Manual of Dissections.

From th
Second revised and improved London edition. Edited, with additions, by W. W. KEEN
M. D., Lecturer on Pathological Anatomy in the Jefferson Medical College, Philadelphia
In one handsome royal 12mo. volume of 578 pages, with 247 illustrations. Cloth, $3 50
leather, $4 00.

ALLEN (HARRISON), M.D.
Professor of Physiology in the Univ. of Pa.

A SYSTEM OF HUMAN ANATOMY: INCLUDING ITS MEDICAL and Surgical Relations. For the Use of Practitioners and Students of Medicine. With an Introductory Chapter on Histology. By E. O. SHAKESPEARE, M. D., Ophthalmologist to the Phila. Hosp. In one large and handsome quarto volume, with several hundred original illustrations on lithographic plates, and numerous wood-cuts in the text. (*Preparing.*)

In this elaborate work, which has been in active preparation for several years, the author has ght to give, not only the details of descriptive anatomy in a clear and condensed form, but also practical applications of the science to medicine and surgery. The work thus has claims upon attention of the general practitioner, as well as of the student, enabling him not only to re- h his recollections of the dissecting room, but also to recognize the significance of all varia- s from normal conditions. The marked utility of the object thus sought by the author is evident, and his long experience and assiduous devotion to its thorough development are a cient guarantee of the manner in which his aims have been carried out. No pains have been red with the illustrations. Those of normal anatomy are from original dissections, drawn on e by Mr. Hermann Faber, with the name of every part clearly engraved upon the figure, the manner of "Holden" and "Gray," and in every typographical detail it will be the t of the publisher to render the volume worthy of the very distinguished position which is cipated for it.

LLIS (GEORGE VINER).
Emeritus Professor of Anatomy in University College, London.

DEMONSTRATIONS OF ANATOMY; Being a Guide to the Knowledge of the Human Body by Dissection. By GEORGE VINER ELLIS, Emeritus Professor of Anatomy in University College, London. From the Eighth and Revised London Edition. In one very handsome octavo volume of over 700 pages, with 256 illustrations. Cloth, $4.25; leather, $5.25. (*Just Ready.*)

This work has long been known in England as the leading authority on practical anatomy, the favorite guide in the dissecting-room, as is attested by the numerous editions through h it has passed. In the last revision, which has just appeared in London, the accomplished her has sought to bring it on a level with the most recent advances of science by making the ssary changes in his account of the microscopic structure of the different organs, as devel- d by the latest researches in textural anatomy.

Ellis's Demonstrations is the favorite text-book the English student of anatomy. In passing ugh eight editions it has been so revised and pted to the needs of the student that it would that it had almost reached perfection in this cial line. The descriptions are clear, and the thods of pursuing anatomical investigations are en with such detail that the book is honestly titled to its name.—*St. Louis Clinical Record*, ne, 1879.

The success of this old manual seems to be as well erved in the present as in the past volumes. The book seems destined to maintain yet for years its leadership over the English manuals upon dissecting.—*Phila. Med. Times*, May 24, 1879.

As a dissector, or a work to have in hand and studied while one is engaged in dissecting, we regard it as the very best work extant, which is certainly saying a very great deal. As a text-book to be studied in the dissecting-room, it is superior to any of the works upon anatomy.—*Cincinnati Med. News*, May 24, 1879.

We most unreservedly recommend it to every practitioner of medicine who can possibly get it.—*Va. Med. Monthly*, June, 1879.

WILSON (ERASMUS), F.R.S.

A SYSTEM OF HUMAN ANATOMY, General and Special. Edited by W. H. GOBRECHT, M.D., Professor of General and Surgical Anatomy in the Medical College of Ohio. Illustrated with three hundred and ninety-seven engravings on wood. In one large and handsome octavo volume, of over 600 large pages; cloth, $4; leather, $5.

SMITH (HENRY H.), M.D., and HORNER (WILLIAM E.), M.D.,
Prof. of Surgery in the Univ. of Penna., &c. — ***Late Prof. of Anatomy in the Univ. of Penna.***

AN ANATOMICAL ATLAS; illustrative of the Structure of the Human Body. In one volume, large imperial octavo, cloth, with about six hundred and fifty beautiful figures. $4 50.

SCHAFER (EDWARD ALBERT), M.D.,
Assistant Professor of Physiology in University College, London.

A COURSE OF PRACTICAL HISTOLOGY: Being an Introduction to the Use of the Microscope. In one handsome royal 12mo. volume of 304 pages, with numerous illustrations: cloth, $2 00. (*Just Issued.*)

HORNER'S SPECIAL ANATOMY AND HISTOLOGY. Eighth edition, extensively revised and modified In 2 vols. 8vo., of over 1000 pages, with 320 wood-cuts: cloth, $6 00.

SHARPEY AND QUAIN'S HUMAN ANATOMY. Revised, by JOSEPH LEIDY, M.D., Prof of Anat. in Univ. of Penn. In two octavo vols. of about 1300 pages, with 511 illustrations. Cloth, $6 00.

BELLAMY'S STUDENT'S GUIDE TO SURGICAL ANATOMY: A Text-book for Students preparing for their Pass Examination. With engravings on wood. In one handsome royal 12mo. volume Cloth, $2 25.

CLELAND'S DIRECTORY FOR THE DISSECTION OF THE HUMAN BODY. In one small volume royal 12mo. of 182 pages: cloth $1 25.

CARPENTER (WILLIAM B.), M.D., F.R.S., F.G.S., F.L.S.,

Registrar to University of London, etc.

PRINCIPLES OF HUMAN PHYSIOLOGY; Edited by HENRY POWER, M.B. Lond., F.R.C.S., Examiner in Natural Sciences, University of Oxford. A new American from the Eighth Revised and Enlarged English Edition, with Notes and Additions, by FRANCIS G. SMITH, M.D., Professor of the Institutes of Medicine in the University of Pennsylvania, etc. In one very large and handsome octavo volume, of 1083 pages with two plates and 373 engravings on wood; cloth, $5 50; leather, $6 50. (*Just Issued.*)

The great work, the crowning labor of the distinguished author, and through which so many generations of students have acquired their knowledge of Physiology, has been almost metamorphosed in the effort to adapt it thoroughly to the requirements of modern science. Since the appearance of the last American edition, it has had several revisions at the experienced hand of Mr. Power, who has modified and enlarged it so as to introduce all that is important in the investigations and discoveries of England, France, and Germany, resulting in an enlargement of about one-fourth in the text. The series of illustrations has undergone a like revision; a large proportion of the former ones having been rejected, and the total number increased to nearly four hundred. The thorough revision which the work has so recently received in England, has rendered unnecessary any elaborate additions in this country, but the American Editor, Professor Smith, has introduced such matters as his long experience has shown him to be requisite for the student. Every care has been taken with the typographical execution, and the work is presented, with its thousand closely, but clearly printed pages, as emphatically the text-book for the student and practitioner of medicine—the one in which, as heretofore, especial care is directed to show the applications of physiology in the various practical branches of medical science. Notwithstanding its very great enlargement, the price has not been increased, rendering this one of the cheapest works now before the profession.

We have been agreeably surprised to find the volume so complete in regard to the structure and functions of the nervous system in all its relations, a subject that, in many respects, is one of the most difficult of all, in the whole range of physiology, upon which to produce a full and satisfactory treatise of the class to which the one before us belongs. The additions by the American editor give to the work as it is a considerable value beyond that of the last English edition. In conclusion, we can give our cordial recommendation to the work as it now appears. The editors have, with their additions to the only work on physiology in our language that, in the fullest sense of the word, is the production of a philosopher as well as a physiologist, brought it up as fully as could be expected, if not desired, to the standard of our knowledge of its subject at the present day. It will deservedly maintain the place it has always had in the favor of the medical profession.—*Journ. of Nervous and Mental Disease*, April, 1877.

"Good wine needs no bush" says the proverb, and an old and faithful servant like the "big" Carpenter, as carefully brought down as this edition has been by Mr. Henry Power, needs little or no commendation by us. Such enormous advances have recently been made in our physiological knowledge, that what was perfectly new a year or two ago, looks now as if it had been a received and established fact for years. In this encyclopædic way it is unrivalled. Here, as it seems to us, is the great value of the book; one is safe in sending a student to it for information on almost any given subject, perfectly certain of the fulness of information it will convey, and well satisfied of the accuracy with which it will there be found stated.—*London Med. Times and Gazette*, Feb. 17, 1877.

The merits of "Carpenter's Physiology" are so widely known and appreciated that we need only allude briefly to the fact that in the latest edition will be found a comprehensive embodiment of the results of recent physiological investigation. Care has been taken to preserve the practical character of the original work. In fact the entire work has been brought up to date, and bears evidence of the amount of labor that has been bestowed upon it by its distinguished editor, Mr. Henry Power. The American editor has made the latest additions, in order fully to cover the time that has elapsed since the last English edition.—*N. Y. Med. Journal*, Jan. 1877.

FOSTER (MICHAEL), M.D., F.R.S.,

Prof. of Physiology in Cambridge Univ., England.

TEXT-BOOK OF PHYSIOLOGY. A new American, from the third English edition. Edited with notes and additions by EDWARD T. REICHERT, M.D., Demonstrator of Experimental Therapeutics in Univ. of Penna. In one handsome royal 12mo. volume, with over 250 illustrations. (*Nearly Ready.*)

The excellence of Mr. Foster's work as an exposition of functional physiology has long been recognized, while for the purposes of the student it has been somewhat deficient as respects the details of structure so necessary to render intelligible the views and theories of the science. These it has been the effort of the editor to add in as concise a manner as possible, and in aid of this he has freely introduced illustrations from recognized authorities. In this improved form it is therefore hoped that the work may prove more than ever acceptable to the student as a clear and comprehensive text-book, presenting the science in its latest development.

The work, since its first appearance, has continued to be one of the most satisfactory text-books on the subject that we have met with, and is in many respects peculiarly adapted to the use of practitioners. Those whose knowledge of the functions of organs was chiefly acquired a decade ago, and who have not since been diligent students of the subject, can little appreciate what advances have been made, and can do nothing better than to give Dr. Foster's work some careful reading.—*New Remedies*, Jan. 1880.

An elaborate review at present is not required; it is only necessary to say that it is the best book of its immediate scope in any of the three languages, so far, at least, as our knowledge goes.—*Philada. Med. Times*, Jan. 3, 1880.

KIRKES (WILLIAM SENHOUSE), M.D.

A MANUAL OF PHYSIOLOGY. Edited by W. MORRANT BAKER, M.D., F.R.C.S. A new American from the eighth and improved London edition. With about two hundred and fifty illustrations. In one large and handsome royal 12mo. volume. Cloth, $3 25; leather, $3 75. (*Lately Issued.*)

HARTSHORNE'S HANDBOOK OF ANATOMY AND PHYSIOLOGY. Second edition, revised. In one royal 12mo. vol., with 220 wood-cuts; cloth, $1 75.

LEHMANN'S MANUAL OF CHEMICAL PHYSIOLOGY. Translated from the German, with Notes and Additions, by J. CHESTON MORRIS, M.D. With illustrations on wood. In one octavo volume of 336 pages. Cloth, $2 25.

LEHMANN'S PHYSIOLOGICAL CHEMISTRY. Complete in two large octavo volumes of 1200 pages, with 200 illustrations; cloth, $6.

DALTON (J. C.), M.D.,

Professor of Physiology in the College of Physicians and Surgeons, New York, &c.

A TREATISE ON HUMAN PHYSIOLOGY. Designed for the use of Students and Practitioners of Medicine. Sixth edition, thoroughly revised and enlarged, with three hundred and sixteen illustrations on wood. In one very beautiful octavo volume, of over 800 pages. Cloth, $5 50; leather, $6 50. (*Just Issued.*)

During the past few years several new works on physiology, and new editions of old works, have appeared, competing for the favor of the medical student, but none will rival this new edition of Dalton. As now enlarged, it will be found also to be, in general, a satisfactory work of reference for the practitioner.—*Chicago Med. Journ. and Examiner*, Jan. 1876.

Prof. Dalton has discussed conflicting theories and conclusions regarding physiological questions with a directness, a fulness, and a conciseness which lend freshness and vigor to the entire book. But his discussions have been so guarded by a refusal of admission to those speculative and theoretical explanations, which at best exist in the minds of observers themselves as only probabilities, that none of his readers need be led into grave errors while making them a study.—*The Medical Record*, Feb. 19, 1876.

The revision of this great work has brought it forward with the physiological advances of the day, and renders it, as it has ever been, the finest work for students extant.—*Nashville Journ. of Med. and Surg.*, Jan. 1876.

In clearness and perspicuity, Dalton's Physiology commended itself to the student years ago, and was a great relief from the verbose productions which it supplanted. Physiology has, however, made many advances since then—and while the style has been preserved intact, the work in the present edition has been brought up fully abreast of the times. The new chemical notation and nomenclature have also been introduced in the present edition. Notwithstanding the multiplicity of text-books on physiology, this will lose none of its old time popularity. The mechanical execution of the work is all that could be desired.—*Peninsular Journal of Medicine*, Dec. 1875.

This popular text-book on physiology comes to us in its sixth edition with the addition of about fifty per cent. of new matter, chiefly in the departments of pathological chemistry and the nervous system, where the principal advances have been realised. With so thorough revision and additions, that keep the work well up to the times, its continued popularity may be confidently predicted, notwithstanding the competition it may encounter. The publisher's work is admirably done.—*St. Louis Med. and Surg. Journ*, Dec. 1875.

We heartily welcome this, the sixth edition of this admirable text-book, than which there are none of equal brevity more valuable. It is cordially recommended by the Professor of Physiology in the University of Louisiana, as by all competent teachers in the United States, and wherever the English language is read, this book has been appreciated. The present edition, with its 316 admirably executed illustrations, has been carefully revised and very much enlarged, although its bulk does not seem perceptibly increased.—*New Orleans Medical and Surgical Journal*, March, 1876.

The present edition is very much superior to every other, not only in that it brings the subject up to the times, but that it does so more fully and satisfactorily than any previous edition. Take it altogether it remains in our humble opinion, the best text-book on physiology in any land or language.—*The Clinic*, Nov. 6, 1875.

As a whole, we cordially recommend the work as a text-book for the student, and as one of the best.—*The Journal of Nervous and Mental Disease*, Jan. 1876.

Still holds its position as a masterpiece of lucid writing, and is, we believe, on the whole, the best book to place in the hands of the student.—*London Students' Journal.*

CLASSEN (ALEXANDER),

Professor in the Royal Polytechnic School, Aix-la-Chapelle.

ELEMENTARY QUANTITATIVE ANALYSIS. Translated with notes and additions by EDGAR F. SMITH, Ph.D., Assistant Prof. of Chemistry in the Towne Scientific School, Univ. of Penna. In one handsome royal 12mo. volume, of 324 pages, with illustrations; cloth, $2 00. (*Just Ready.*)

It is probably the best manual of an elementary nature extant, insomuch as its methods are the best. It teaches by examples, commencing with single determinations, followed by separations, and then advancing to the analysis of minerals and such products as are met with in applied chemistry. It is an indispensable book for students in chemistry.—*Boston Journ. of Chemistry*, Oct. 1878.

GALLOWAY (ROBERT), F.C.S.,

Prof of Applied Chemistry in the Royal College of Science for Ireland, etc.

A MANUAL OF QUALITATIVE ANALYSIS. From the Fifth London Edition. In one neat royal 12mo. volume, with illustrations; cloth, $2 75. (*Lately Issued.*)

BOWMAN (JOHN E.), M.D.

INTRODUCTION TO PRACTICAL CHEMISTRY, INCLUDING ANALYSIS. Sixth American, from the sixth and revised London edition. With numerous illustrations. In one neat vol., royal 12mo., cloth, $2 25.

GREENE (WILLIAM H.), M.D.,

Demonstrator of Chemistry in Med. Dept, Univ. of Penna.

A MANUAL OF MEDICAL CHEMISTRY. For the Use of Students. Based upon Bowman's Medical Chemistry. In one royal 12mo. volume of about 400 pages. With illustrations. (*Shortly.*)

REMSEN (IRA), M.D., Ph.D.,

Professor of Chemistry in the Johns Hopkins University, Baltimore.

PRINCIPLES OF THEORETICAL CHEMISTRY, with special reference to the Constitution of Chemical Compounds. In one handsome royal 12mo. vol. of over 232 pages: cloth, $1 50. (*Just Issued.*)

WOHLER AND FITTIG.

OUTLINES OF ORGANIC CHEMISTRY. Translated with Additions from the Eighth German Ed. By IRA REMSEN, M.D., Ph.D., Prof. of Chem. and Physics in Williams College, Mass. In one volume, royal 12mo. of 550 pp., cloth, $3.

FOWNES (GEORGE), Ph.D.

A MANUAL OF ELEMENTARY CHEMISTRY; Theoretical a

Practical. Revised and corrected by HENRY WATTS, B.A., F R.S., author of "A Dictio ary of Chemistry," etc. With a colored plate, and one hundred and seventy-seven ill trations. A new American, from the twelfth and enlarged London edition. Edited ROBERT BRIDGES, M.D. In one large royal 12mo. volume, of over 1000 pag cloth, $2 75; leather, $3 25. (*Just Ready.*)

Two careful revisions by Mr. Watts, since the appearance of the last American edition "Fownes," have so enlarged the work that in England it has been divided into two volumes reprinting it, by the use of a small and exceedingly clear type, cast for the purpose, it has b found possible to comprise the whole, without omission, in one volume, not unhandy for study a reference. The enlargement of the work has induced the American Editor to confine his additi to the narrowest compass, and he has accordingly inserted only such discoveries as have been nounced since the very recent appearance of the work in England, and has added the standa in popular use to the Decimal and Centigrade systems employed in the original.

Among the additions to this edition will be found a very handsome colored plate, represent a number of spectra in the spectroscope. Every care has been taken in the typographical exe tion to render the volume worthy in every respect of its high reputation and extended use, a though it has been enlarged by more than one hundred and fifty pages, its very moderate pr will still maintain it as one of the cheapest volumes accessible to the chemical student.

This work, inorganic and organic, is complete in one convenient volume. In its earliest editions it was fully up to the latest advancements and theories of that time. In its present form, it presents, in a remarkably convenient and satisfactory manner, the principles and leading facts of the chemistry of *to-day*. Concerning the manner in which the various subjects are treated, much deserves to be said, and mostly, too, in praise of the book. A review of such a work as *Fownes's Chemistry* within the limits of a book-notice for a medical weekly is simply out of the question.—*Cincinnati Lancet and Clinic*, Dec. 14, 1878.

When we state that, in our opinion, the present edition sustains in every respect the high reputation which its predecessors have acquired and enjoyed, we express therewith our full belief in its intrinsic value as a text-book and work of reference.—*Am. Journ. of Pharm.*, Aug. 1878.

The conscientious care which has been bestowed upon it by the American and English editors renders it still, perhaps, the best book for the student and the practitioner who would keep alive the acquisitions of his student days. It has, indeed, reached a somewhat formidable magnitude with its more tha thousand pages, but with less than this no fair re sentation of chemistry as it now is can be given. T type is small but very clear, and the sections are v lucidly arranged to facilitate study and referenc *Med and Surg. Reporter*, Aug. 3, 1878.

The work is too well known to American stude to need any extended notice; suffice it to say t the revision by the English editor has been faithf done, and that Professor Bridges has added s fresh and valuable matter, especially in the i ganic chemistry. The book has always been a vorite in this country, and in its new shape fair to retain all its former *prestige.—Boston J of Chemistry*, Aug. 1878.

It will be entirely unnecessary for us to make remarks relating to the general character of Fow Manual. For over twenty years it has held *the* most place as a text-book, and the elaborate thorough revisions which have been made from t to time leave little chance for any wide awake riv step before it.—*Canadian Pharm. Jour.*, Aug. 1

As a manual of chemistry it is without a supe in the language.—*Md. Med. Jour.*, Aug. 1878.

ATTFIELD (JOHN), Ph.D.,

Professor of Practical Chemistry to the Pharmaceutical Society of Great Britain, &c.

CHEMISTRY, GENERAL, MEDICAL, AND PHARMACEUTICA

including the Chemistry of the U. S. Pharmacopœia. A Manual of the General Princi of the Science, and their Application to Medicine and Pharmacy. Eighth edition rev by the author. In one handsome royal 12mo. volume of 700 pages, with illustratio Cloth, $2 50; leather, $3 00. (*Just Ready.*)

We have repeatedly expressed our favorable opinion of this work, and on the appearance of a new edition of it, little remains for us to say, except that we expect this eighth edition to be as indispensable to us as the seventh and previous editions have been. While the general plan and arrangement have been adhered to, new matter has been added covering the observations made since the former edition The present differs from the preceding one chiefly in these alterations and in about ten pages of useful tables added in the appendix —*Am. Jour. of Pharmacy*, May, 1879.

A standard work like Attfield's Chemistry need only be mentioned by its name, without further comments The present edition contains such alterations and additions as seemed necessary for the demonstration of the latest developments of chemical principles, and the latest applications of chemistry to pharmacy. The author has bestowed arduous labor on the revision, and the extent of the information thus introduced may be estimated from the fact that the index contains three hundred new references relating to additional material.—*Druggists' Circular and Chemical Gazette*, May, 1879.

This very popular and meritorious work has now reached its eighth edition, which fact speaks in the highest terms in commendation of its excellence. It has now become the principal text-book of chemistry in all the medical colleges in United States. The present edition contains s alterations and additions as seemed necessary the demonstration of the latest developmen chemical principles, and the latest applicatio chemistry to pharmacy. It is scarcely neces for us to say that it exhibits chemistry in its sent advanced state.—*Cincinnati Medical N* April, 1879.

The popularity which this work has enjoye owing to the original and clear disposition of facts of the science, the accuracy of the details, the omission of much which freights many treat heavily without bringing corresponding instruct to the reader. Dr. Attfield writes for students, primarily for medical students; he always has eye to the pharmacopœia and its officinal prep tions; and he is continually putting the matter the text so that it responds to the questions w which each section is provided. Thus the stud learns easily, and can always refresh and test knowledge.—*Med and Surg. Reporter*, April 19,'

We noticed only about two years and a half the publication of the preceding edition, and marked upon the exceptionally valuable chara of the work. The work now includes the whole the chemistry of the pharmacopœia of the Uni States, Great Britain, and India.—*New Remed* May, 1879.

BLOXAM (C. L.),

Professor of Chemistry in King's College, London.

CHEMISTRY, INORGANIC AND ORGANIC. From the Second London Edition. In one very handsome octavo volume, of 700 pages, with about 300 illustrations. Cloth, $4 00; leather, $5 00. (*Lately Issued.*)

We have in this work a complete and most excellent text-book for the use of schools, and can heartily recommend it as such.—*Boston Med. and Surg. Journ.*, May 28, 1874.

The above is the title of a work which we can most conscientiously recommend to students of chemistry. It is as easy as a work on chemistry could be made, at the same time that it presents a full account of that science as it now stands. We have spoken of the work as admirably adapted to the wants of students; it is quite as well suited to the requirements of practitioners who wish to review their chemistry, or have occasion to refresh their memories on any point relating to it. In a word, it is a book to be read by all who wish to know what is the chemistry of the present day.—*American Practitioner*, Nov. 1873.

It would be difficult for a practical chemist and teacher to find any material fault with this most admirable treatise. The author has given us almost a cyclopædia within the limits of a convenient volume, and has done so without penning the *useless* paragraphs too commonly making up a great part of the bulk of many cumbrous works. The progressive scientist is not disappointed when he looks for the record of new and valuable processes and discoveries, while the cautious conservative does not find its pages monopolized by uncertain theories and speculations. A peculiar point of excellence is the crystallized form of expression in which great truths are expressed in very short paragraphs. One is surprised at the brief space allotted to an important topic, and yet, after reading it, he feels that little, if any more should have been said. Altogether, it is seldom you see a text-book so nearly faultless. — *Cincinnati Lancet* Nov. 1873.

CLOWES (FRANK), D.Sc., London.

Senior Science-Master at the High School, Newcastle-under Lyme, etc.

AN ELEMENTARY TREATISE ON PRACTICAL CHEMISTRY AND QUALITATIVE INORGANIC ANALYSIS. Specially adapted for Use in the Laboratories of Schools and Colleges and by Beginners. From the Second and Revised English Edition, with about fifty illustrations on wood. In one very handsome royal 12mo. volume of 372 pages: cloth. $2 50. (*Now Ready.*)

It is short, concise, and eminently practical. We therefore heartily commend it to students, and especially to those who are obliged to dispense with a master. Of course, a teacher is in every way desirable, but a good degree of technical skill and practical knowledge can be attained with no other instructor than the very valuable handbook now under consideration.—*St. Louis Clin. Record*, Oct. '77.

The work is so written and arranged that it can be comprehended by the student without a teacher, and the descriptions and directions for the various work are so simple, and yet concise, as to be interesting and intelligible. The work is unincumbered with theoretical deductions, dealing wholly with the practical matter, which it is the aim of this comprehensive text-book to impart. The accuracy of the analytical methods are vouched for from the fact that they have all been worked through by the author and the members of his class, from the printed text. We can heartily recommend the work to the student of chemistry as being a reliable and comprehensive one.—*Druggists' Advertiser*, Oct. 15, 1877.

NAPP'S TECHNOLOGY; or Chemistry Applied to the Arts, and to Manufactures. With American additions by Prof. WALTER R. JOHNSON. In two very handsome octavo volumes, with 500 wood engravings, cloth, $6 00.

PARRISH (EDWARD),

Late Professor of Materia Medica in the Philadelphia College of Pharmacy.

A TREATISE ON PHARMACY. Designed as a Text-Book for the Student, and as a Guide for the Physician and Pharmaceutist. With many Formulæ and Prescriptions. Fourth Edition, thoroughly revised, by THOMAS S. WIEGAND. In one handsome octavo volume of 977 pages, with 280 illustrations; cloth, $5 50; leather, $6 50. (*Lately Issued.*)

Of Mr. Parrish's great work on pharmacy it only remains to be said that the editor has accomplished the work so well as to maintain, in this fourth edition, the high standard of excellence which it had attained in previous editions, under the editorship of its accomplished author. This has not been accomplished without much labor, and many additions and improvements, involving changes in the arrangement of the several parts of the work, and the addition of much new matter. With the modifications thus effected it constitutes, as now presented, a compendium of the science and art indispensable to the pharmacist, and of the utmost value to every practitioner of medicine desirous of familiarizing himself with the pharmaceutical preparation of the articles which he prescribes for his patients.—*Chicago Med. Journ.*, July, 1874.

The work is eminently practical, and has the rare merit of being readable and interesting, while it preserves a strictly scientific character. The whole work reflects the greatest credit on author, editor and publisher. It will convey some idea of the liberality which has been bestowed upon its production when we mention that there are no less than 280 carefully executed illustrations. In conclusion, we heartily recommend the work, not only to pharmacists, but also to the multitude of medical practitioners who are obliged to compound their own medicines. It will ever hold an honored place on our own bookshelves.—*Dublin Med. Press and Circular*, Aug. 12, 1874.

We expressed our opinion of a former edition in terms of unqualified praise, and we are in no mood to detract from that opinion in reference to the present edition, the preparation of which has fallen into competent hands. It is a book with which no pharmacist can dispense, and from which no physician can fail to derive much information of value to him in practice.—*Pacific Med. and Surg. Journ.*, June, '74.

Perhaps one, if not the most important book upon pharmacy which has appeared in the English language has emanated from the transatlantic press. "Parrish's Pharmacy" is a well-known work on this side of the water, and the fact shows us that a really useful work never becomes merely local in its fame. Thanks to the judicious editing of Mr. Wiegand, the posthumous edition of "Parrish" has been saved to the public with all the mature experience of its author, and perhaps none the worse for a dash of new blood.—*Lond. Pharm. Journal*, Oct. 17, 1874.

CORNIL (V.), *AND* *RANVIER (L.),*

Prof. in the Faculty of Med., Paris. *Prof. in the College of France.*

MANUAL OF PATHOLOGICAL HISTOLOGY. Translated, with Notes and Additions, by E. O. SHAKESPEARE, M.D., Pathologist and Ophthalmic Surgeon to Philada. Hospital, Lecturer on Refraction and Operative Ophthalmic Surgery in Univ. of Penna., and by HENRY C. SIMES, M D., Demonstrator of Pathological Histology in the Univ. of Pa. In one very handsome octavo volume of over 700 pages, with over 350 illustrations Cloth, $5 50; leather, $6 50. (*Just Ready.*)

So much has been done of late years in the elucidation of pathology by means of the microscope, and this subject now occupies so prominent a position as one of the most important branches of medical science, that the American profession cannot fail to welcome a translation of the present work, which, through its own merits and through the well-known reputation of its distinguished authors, is regarded in Europe as the standard text-book and work of reference in its department. Such investigations and discoveries as have been made since its appearance will be introduced by the translator, and the work is confidently expected to assume in this country the same position which has been so universally accorded to it abroad.

WATSON (THOMAS), M.D., &c.

LECTURES ON THE PRINCIPLES AND PRACTICE OF PHYSIC. Delivered at King's College, London. A new American, from the Fifth revised and enlarged English edition. Edited, with additions, and several hundred illustrations, by HENRY HARTSHORNE, M.D., Professor of Hygiene in the University of Pennsylvania. In two large and handsome 8vo. vols. Cloth, $9 00; leather, $11 00. (*Lately Published.*)

FENWICK (SAMUEL), M.D.,

Assistant Physician to the London Hospital.

THE STUDENT'S GUIDE TO MEDICAL DIAGNOSIS. From the Third Revised and Enlarged English Edition. With eighty-four illustrations on wood. In one very handsome volume, royal 12mo., cloth, $2 25. (*Just Issued.*)

GREEN (T. HENRY), M.D.,

Lecturer on Pathology and Morbid Anatomy at Charing-Cross Hospital Medical School, etc.

PATHOLOGY AND MORBID ANATOMY. Third American, from the Fourth and Enlarged and Revised English Edition. In one very handsome octavo volume of 332 pages, with 132 illustrations; cloth, $2 25. (*Just Ready.*)

This is unquestionably one of the best manuals on the subject of pathology and morbid anatomy that can be placed in the student's hands, and we are glad to see it kept up to the times by new editions. Each edition is carefully revised by the author, with the view of making it include the most recent advances in pathology, and of omitting whatever may have become obsolete.—*N. Y. Med. Jour.*, Feb. 1879

The treatise of Dr. Green is compact, clearly expressed, up to the times, and popular as a text-book, both in England and America. The cuts are sufficiently numerous, and usually well made. In the present edition, such new matter has been added as was necessary to embrace the later results in pathological research. No doubt it will continue to enjoy the favor it has received at the hands of the profession.—*Med and Surg. Reporter*, Feb. 1, 1879.

For practical, ordinary daily use, this is undoubtedly the best treatise that is offered to students of pathology and morbid anatomy.—*Cincinnati Lancet and Clinic*, Feb. 8, 1879.

DAVIS (NATHAN S.),

Prof. of Principles and Practice of Medicine, etc., in Chicago Med. College.

CLINICAL LECTURES ON VARIOUS IMPORTANT DISEASES; being a collection of the Clinical Lectures delivered in the Medical Wards of Mercy Hospital, Chicago. Edited by FRANK H. DAVIS, M.D. Second edition, enlarged. In one handsome royal 12mo. volume. Cloth, $1 75. (*Lately Issued.*)

CHRISTISON'S DISPENSATORY. With copious additions, and 213 large wood engravings. By R. EGLESFIELD GRIFFITH, M.D. One vol. 8vo., pp. 1000, cloth. $4 00.

CARPENTER'S PRIZE ESSAY ON THE USE OF ALCOHOLIC LIQUORS IN HEALTH AND DISEASE. New edition, with a Preface by D. F. CONDIE, M.D., and explanations of scientific words. In one neat 12mo. volume, pp. 178, cloth. 60 cents.

GLUGE'S ATLAS OF PATHOLOGICAL HISTOLOGY Translated, with Notes and Additions, by JOSEPH LEIDY, M. D. In one volume, very large imperial quarto, with 320 copper-plate figures, plain and colored, cloth. $4 00.

PAVY'S TREATISE ON THE FUNCTION OF DIGESTION: its Disorders and their Treatment. From the second London edition. In one handsome volume, small octavo, cloth, $2 00.

LA ROCHE ON YELLOW FEVER. considered in its Historical, Pathological, Etiological, and Therapeutical Relations. In two large and handsome octavo volumes of nearly 1500 pp., cloth. $7 00.

HOLLAND'S MEDICAL NOTES AND REFLECTIONS. 1 vol. 8vo., pp. 500, cloth. $3 50

BARLOW'S MANUAL OF THE PRACTICE OF MEDICINE. With Additions by D. F. CONDIE, M D. 1 vol. 8vo., pp 600, cloth. $2 50.

TODD'S CLINICAL LECTURES ON CERTAIN ACUTE DISEASES. In one neat octavo volume, of 320 pp., cloth. $2 50

STURGES'S INTRODUCTION TO THE STUDY OF CLINICAL MEDICINE. Being a Guide to the Investigation of Disease. In one handsome 12mo. volume, cloth, $1 25. (*Lately Issued.*)

STOKES' LECTURES ON FEVER. Edited by JOHN WILLIAM MOORE, M. D., Assistant Physician to the Cork Street Fever Hospital. In one neat 8vo. volume, cloth, $2 00. (*Just Issued.*)

THE CYCLOPÆDIA OF PRACTICAL MEDICINE: comprising Treatises on the Nature and Treatment of Diseases, Materia Medica and Therapeutics, Diseases of Women and Children, Medical Jurisprudence, etc etc. By DUNGLISON, FORBES, TWEEDIE, and CONOLLY. In four large super-royal octavo volumes, of 3254 double columned pages, strongly and handsomely bound in leather, $15; cloth, $11.

STILLE (ALFRED), M.D., LL.D., *and* **MAISCH (JOHN M.), Ph.D.,**
Prof. of Theory and Practice of Medicine and of Clinical Med. in Univ. of Pa.
Prof. of Mat. Med. and Bot. in Phila. Coll. Pharmacy, Secy. to the American Pharmaceutical Association.

THE NATIONAL DISPENSATORY: Containing the Natural History, Chemistry, Pharmacy, Actions and Uses of Medicines, including those recognized in the Pharmacopœias of the United States, Great Britain, and Germany, with numerous references to the French Codex. Second edition, thoroughly revised, with numerous additions. In one very handsome octavo volume of 1692 pages, with 289 illustrations. Extra cloth, $6 75; leather, raised bands, $7 50. (*Now Ready.*)

PREFACE TO THE SECOND EDITION.

The demand which has exhausted in a few months an unusually large edition of the National pensatory is doubly gratifying to the authors, as showing that they were correct in thinking t the want of such a work was felt by the medical and pharmaceutical professions, and that ir efforts to supply that want have been acceptable. This appreciation of their labors has ulated them in the revision to render the volume more worthy of the very marked favor which it has been received. The first edition of a work of such magnitude must necessarily more or less imperfect; and though but little that is new and important has been brought light in the short interval since its publication, yet the length of time during which it was ing through the press rendered the earlier portions more in arrears than the later. The rtunity for a revision has enabled the authors to scrutinize the work as a whole, and to duce alterations and additions wherever there has seemed to be occasion for improve- ter greater completeness. The principal changes to be noted are the introduction of seve- rugs under separate headings, and of a large number of drugs, chemicals, and pharma- ical preparations classified as allied drugs and preparations under the heading of more portant or better known articles: these additions comprise in part nearly the entire German rmacopœia and numerous articles from the French Codex. All new investigations which to the authors' notice up to the time of publication have received due consideration.

The series of illustrations has undergone a corresponding thorough revision. A number have added, and still more have been substituted for such as were deemed less satisfactory.

The new matter embraced in the text is equal to nearly one hundred pages of the first edition. siderable as are these changes as a whole, they have been accommodated by an enlargement the page without increasing unduly the size of the volume.

While numerous additions have been made to the sections which relate to the physiological tion of medicines and their use in the treatment of disease, great care has been taken to ke them as concise as was possible without rendering them incomplete or obscure. The s have been expressed in the terms both of troy weight and of the metrical system, for the pose of making those who employ the Dispensatory familiar with the latter, and paving the y for its introduction into general use.

The Therapeutical Index has been extended by about 2250 new references, making the total mber in the present edition about 6000.

The articles there enumerated as remedies for particular diseases are not only those which, the authors' opinion, are curative, or even beneficial, but those also which have at any time employed on the ground of popular belief or professional authority. It is often of as ch consequence to be acquainted with the worthlessness of certain medicines or with the row limits of their power, as to know the well attested virtues of others and the conditions der which they are displayed. An additional value possessed by such an Index is, that it tains the elements of a natural classification of medicines, founded upon an analysis of the lts of experience, which is the only safe guide in the treatment of disease.

evidence of success, seldom paralleled, clearly how well the authors have met the g needs of the pharmaceutical and medical ions. Gratifying as it must be to them, they embraced the opportunity offered for a thor- vision of the whole work, striving to em- within it all that might have been omitted in rmer edition, and all that has newly appeared ficient importance during the time of its col- ation, and the short interval elapsed since the ious publication. After having gone carefully gh the volume we must admit that the authors labored faithfully, and with success, in main- g the high character of their work as a com- m meeting the requirements of the day, to h one can safely turn in quest of the latest in- ation concerning everything worthy of notice in nection with Pharmacy, Materia Medica, and apeutics.—*Am. Jour. of Pharmacy*, Nov. 1879.

It is with great pleasure that we announce to our ders the appearance of a *second* edition of the ional Dispensatory. The total exhaustion of the edition in the short space of six months, is a ficient testimony to the value placed upon the rk by the profession. It appears that the rapid of the first edition must have induced both the ors and the publisher to make preparations for new edition immediately after the first had been ed, for we find a large amount of new matter ded and a good deal of the previous text altered d improved, which proves that the authors do not intend to let the grass grow under their feet, but to keep the work up to the time.—*New Remedies*, Nov. 1879.

This is a great work by two of the ablest writers on materia medica in America. The authors have produced a work which, for accuracy and comprehensiveness, is unsurpassed by any work on the subject. There is no book in the English language which contains so much valuable information on the various articles of the materia medica. The work has cost the authors years of laborious study, but they have succeeded in producing a dispensatory which is not only *national*, but will be a lasting memorial of the learning and ability of the authors who produced it.—*Edinburgh Medical Journal*, Nov. 1879.

A new edition of this great work, only a few months after the first, takes us by surprise. It indicates the high appreciation of its value on the part of physicians and pharmacists, by which a large edition has been so soon exhausted. The present is not merely a reprint but a revision, with important additions and modifications, requiring 100 pages of new matter, and an index increased by 2250 references. The doses are stated in both the ordinary and metric terms. All the more important material of the German and French Pharmacopœias is embodied. It is by far more international or universal than any other book of the kind in our language, and more comprehensive in every sense.—*Pacific Med. and Surg. Journ.*, Oct. 1879.

BRISTOWE (JOHN SYER), M.D., F.R.C.P.,
Physician and Joint Lecturer on Medicine, St. Thomas's Hospital.

A TREATISE ON THE PRACTICE OF MEDICINE. Second American edition, revised by the Author. Edited, with Additions, by JAMES H. HUTCHINSON, M.D., Physician to the Penna. Hospital. In one handsome octavo volume of nearly 1200 pages. With illustrations. Cloth, $5 50; leather, $6 50. (*Just Ready*.)

In reprinting this work from the recent thoroughly revised second English edition, the author has made such corrections as seemed advisable, and has added a chapter on Insanity. The Editor has likewise revised his additions in the light of the latest experience, and the work is presented as reflecting in every way the most modern aspect of medical science, and as fully entitled to maintain the distinguished position accorded to it on both sides of the Atlantic as an authoritative guide for the student, and a complete though concise book of reference for the practitioner. Notwithstanding the author's earnest effort at compression, the additions have amounted to about one-tenth of the previous edition: but by the use of an enlarged page these have been accommodated without increasing the size of the volume, while a reduction in the price renders it one of the cheapest works accessible to the profession.

A few notices of the first edition are subjoined.

A new edition of this well-known work, which has had the advantage of careful revision not only by its author but also by Dr Hutchinson, than whom there is no one in this country better fitted for the task.—*Phila. Med. Times*, Jan. 3, 1880.

The popularity of the work depends, no doubt, upon the clear and incisive way in which it is written, and the attention to details likely to occur in practice, rather than the discussion of questions of theory.—*New Remedies*, Jan. 1880.

What we said of the first edition, we can, with increased emphasis, repeat concerning this: "Every page is characterized by the utterances of a thoughtful man. What has been said, has been well said, and the book is a fair reflex of all that is *certainly known* on the subjects considered."—*Ohio Med. Recorder*, Jan. 7, 1880.

This is not only one of the latest and most comprehensive works out on the general subject of Theory and Practice of Medicine, but it is unquestionably one of the best.—*So. Med. Practitioner*, Jan. 1880.

WOODBURY (FRANK), M.D.,
Physician to the German Hospital, Philadelphia, late Chief Assist. to Med. Clinic, Jeff. College Hospital, etc.

A HANDBOOK OF THE PRINCIPLES AND PRACTICE OF Medicine; for the use of Students and Practitioners. Based upon Husband's Handbook of Practice. In one neat volume, royal 12mo. (*In Press.*)

HABERSHON (S. O.) M.D.
Senior Physician to and late Lecturer on the Principles and Practice of Medicine at Guy's Hospital, etc.

ON THE DISEASES OF THE ABDOMEN, COMPRISING THOSE of the Stomach, and other parts of the Alimentary Canal, Œsophagus, Cæcum, Intestines, and Peritoneum. Second American, from the third enlarged and revised English edition. With illustrations. In one handsome octavo volume of over 500 pages. Cloth, $3 50. (*Now Ready.*)

We can do very little to add to the favorable reception which has already been given by the medical press of the world to this well known treatise We commend to all practitioners a careful perusal of Dr. Habershon's work More especially, we draw attention to the number of intestinal diseases recorded in its pages, cases of extreme interest clinically and pathologically. This careful record shows that the work is no compilation, but a careful exposition of the author's personal experience.—*Canadian Med. and Surg. Journ.*, May, 1879.

This valuable treatise on diseases of the stomach and abdomen has been out of print for several years, and is therefore not so well known to the profession as it deserves to be. It will be found a cyclopædia of information, systematically arranged, on all diseases of the alimentary tract, from the mouth to the rectum A fair proportion of each chapter is devoted to symptoms, pathology, and therapeutics. The present edition is fuller than former ones in many particulars, and has been thoroughly revised and amended by the author. Several new chapters have been added, bringing the work fully up to the times, and making it a volume of interest to the practitioner in every field of medicine and surgery. Perverted nutrition is in some form associated with all diseases we have to combat, and we need all the light that can be obtained on a subject so broad and general. Dr Habershon's work is one that every practitioner should read and study for himself.—*N. Y. Med. Journ.*, April, 1879.

FOTHERGILL (J. MILNER), M.D. Edin., M.R.C.P. Lond.,
Asst. Phys. to the West Lond. Hosp.: Asst. Phys. to the City of Lond. Hosp., etc.

THE PRACTITIONER'S HANDBOOK OF TREATMENT; Or, the Principles of Therapeutics. In one very neat octavo volume of about 550 pages: cloth, $4 00. (*Now Ready.*)

Our friends will find this a very readable book; and that it sheds light upon every theme it touches, causing the practitioner to feel more certain of his diagnosis in difficult cases. We confidently commend the work to our readers as one worthy of careful perusal. It lights the way over obscure and difficult passes in medical practice. The chapter on the circulation of the blood is the most exhaustive and instructive to be found. It is a book every practitioner needs, and would have, if he knew how suggestive and helpful it would be to him.—*St. Louis Med. and Surg. Journ*, April, 1877.

We heartily commend his book to the medical student as an honest and intelligent guide through the mazes of therapeutics, and assure the practitioner who has grown gray in the harness that he will derive pleasure and instruction from its perusal. Valuable suggestions and material for thought abound throughout.—*Boston Med. and Surg Journal*, Mar. 8, 1877.

BY THE SAME AUTHOR.

THE ANTAGONISM OF THERAPEUTIC AGENTS, AND WHAT IT TEACHES. Being the Fothergillian Prize Essay for 1878. In one neat volume, royal 12mo. of 156 pages; cloth, $1 00. (*Just Ready.*)

FLINT (AUSTIN), M.D.,

Professor of the Principles and Practice of Medicine in Bellevue Med. College, N. Y.

A TREATISE ON THE PRINCIPLES AND PRACTICE OF MEDICINE; designed for the use of Students and Practitioners of Medicine. Fourth edition, revised and enlarged. In one large and closely printed octavo volume of about 1100 pp.; cloth, $6 00; or strongly bound in leather, with raised bands, $7 00. (*Lately Issued.*)

By common consent of the English and American medical press, this work has been assigned to the highest position as a complete and compendious text-book on the most advanced condition of medical science. At the very moderate price at which it is offered it will be found one of the cheapest volumes now before the profession.

This excellent treatise on medicine has acquired itself in the United States a reputation similar to that enjoyed in England by the admirable lectures of Sir Thomas Watson. We have referred to many of the most important chapters, and find the revision spoken of in the preface is a genuine one, and that the author has very fairly brought up his matter to the level of the knowledge of the present day. The work has this great recommendation, that it is in one volume, and therefore will not be so terrifying to the student as the bulky volumes which several of our British text-books of medicine have developed into.—*British and Foreign Med.-Chir. Rev.*, Jan. 1875.

It is of course unnecessary to introduce or eulogize this new standard treatise. The present edition has been enlarged and revised to bring it up to the author's present level of experience and reading. His own clinical studies and the latest contributions to medical literature both in this country and in Europe, have received careful attention, so that some portions have been entirely rewritten, and about seventy pages of new matter have been added.—*Chicago Med. Jour.*, June, 1873.

Has never been surpassed as a text-book for students and a book of ready reference for practitioners. The force of its logic, its simple and practical teachings, have left it without a rival in the field *N. Y.—Med. Record*, Sept. 15, 1874.

It is given to very few men to tread in the steps of Austin Flint, whose single volume on medicine, though here and there defective, is a masterpiece of lucid condensation and of general grasp of an enormously wide subject.—*Lond. Practitioner*, Dec.'73

BY THE SAME AUTHOR.

CLINICAL MEDICINE; a Systematic Treatise on the Diagnosis and Treatment of Diseases. Designed for Students and Practitioners of Medicine. In one large and handsome octavo volume of 795 pages; cloth, $4 50; leather, $5 50. (*Now Ready.*)

It is here that the skill and learning of the great clinician are displayed. He has given us a storehouse of medical knowledge, excellent for the student, convenient for the practitioner, the result of a long life of the most faithful clinical work, collected by an energy as vigilant and systematic as untiring, and weighed by a judgment no less clear than his observation is close.—*Archives of Medicine*, Dec. 1879

The author of the above work has anticipated a want long felt by those for whom it was especially written—the clinical student during his pupilage, and the busy practitioner. He has given to the medical profession a very necessary and useful work, complete in detail, accurate in observation, and in statement.—*St. Louis Courier of Med.*, 1879.

There is every reason to believe that this book will be well received. The active practitioner is constantly in need of some work that will enable him to obtain information in the diagnosis and treatment of cases with comparatively little labor. That has the faculty of expressing himself clearly, and at the same time so concisely as to enable the searcher to traverse the entire ground of his search, and at the same time obtain all that is essential, without plodding through an interminable space.—*N. Y. Med. Jour.*, Nov. 1879

The eminent teacher who has written the volume under consideration has recognized the needs of the American profession, and the result is all that we could wish. The style in which it is written is peculiarly the author's; it is clear and forcible, and marked by those characteristics which have rendered him one of the best writers and teachers this country has ever produced. We have not space for so full a consideration of this remarkable work as we would desire.—*S. Louis Clin. Record*, Oct. 1879.

It is venturing little to say that there are few men so well fitted as Dr Flint to impart information on these last mentioned subjects, and the present work is a timely one as relates both to the author's capacity to undertake it and the need for it as an accompaniment to the multitude now issued, in which the subject of treatment is but little considered.—*New Remedies*, Nov. 1879.

BY THE SAME AUTHOR.

ESSAYS ON CONSERVATIVE MEDICINE AND KINDRED TOPICS. In one very handsome royal 12mo. volume. Cloth, $1 38. (*Just Issued.*)

HARTSHORNE (HENRY), M.D.,

Professor of Hygiene in the University of Pennsylvania

ESSENTIALS OF THE PRINCIPLES AND PRACTICE OF MEDICINE. A handy-book for Students and Practitioners. Fourth edition, revised and improved. With about one hundred illustrations. In one handsome royal 12mo. volume, of about 550 pages, cloth, $2 63; half bound, $2 88. (*Lately Issued.*)

As a handbook, which clearly sets forth the ESSENTIALS of the PRINCIPLES AND PRACTICE OF MEDICINE, we do not know of its equal.—*Va. Med. Monthly.*

As a brief, condensed, but comprehensive handbook, it cannot be improved upon.—*Chicago Med. Examiner*, Nov. 15, 1874.

Without doubt the best book of the kind published in the English language.—*St. Louis Med. and Surg. Journ.*, Nov. 1874.

BRISTOWE (JOHN SYER), *M.D., F.R.C.P.*,

Physician and Joint Lecturer on Medicine, St. Thomas's Hospital.

A TREATISE ON THE PRACTICE OF MEDICINE. Seco American edition, revised by the Author. Edited, with Additions, by JAMES H. HUTC INSON, M.D., Physician to the Penna. Hospital. In one handsome octavo volume nearly 1200 pages. With illustrations. Cloth, $5 50; leather, $6 50. (*Just Read*

REYNOLDS (J. RUSSELL). M.D.,

Prof. of the Principles and Practice of Medicine in Univ. College, London.

A SYSTEM OF MEDICINE WITH NOTES AND ADDITIONS BY HENRY HARTSHORNE, M.D., late Professor of Hygiene in the University of Penna. In three large and handsome octavo volumes, containing about 3000 closely printed double-columned pages, with numerous illustrations. Sold only by subscription. Price per vol., in cloth, $5.00; in leather, $6.00.

ME I. (*just ready*) contains GENERAL DISEASES and DISEASES OF THE NERVOUS SYSTEM.
ME II. (*just ready*) contains DISEASES OF RESPIRATORY and CIRCULATORY SYSTEMS.
ME III. (*preparing for early publication*) will contain DISEASES OF THE DIGESTIVE and BLOOD GLANDULAR SYSTEMS, OF THE URINARY ORGANS, OF THE FEMALE REPRODUCTIVE SYSTEM, and OF THE CUTANEOUS SYSTEM.

ynolds's SYSTEM OF MEDICINE, recently completed, has acquired, since the first appearance e first volume, the well-deserved reputation of being the work in which modern British icine is presented in its fullest and most practical form. This could scarce be otherwise in of the fact that it is the result of the collaboration of the leading minds of the profession, subject being treated by some gentleman who is regarded as its highest authority—as for nce, Diseases of the Bladder by Sir HENRY THOMPSON, Malpositions of the Uterus by Y HEWITT, Insanity by HENRY MAUDSLEY, Consumption by J. HUGHES BENNET, Dis- of the Spine by CHARLES BLAND RADCLIFFE, Pericarditis by FRANCIS SIBSON, Alcoholism ANCIS E. ANSTIE, Renal Affections by WILLIAM ROBERTS, Asthma by HYDE SALTER, ral Affections by H CHARLTON BASTIAN, Gout and Rheumatism by ALFRED BARING GAR- Constitutional Syphilis by JONATHAN HUTCHINSON, Diseases of the Stomach by WILSON Diseases of the Skin by BALMANNO SQUIRE, Affections of the Larynx by MORELL MAC-, Diseases of the Rectum by BLIZARD CURLING, Diabetes by LAUDER BRUNTON, Intes- Diseases by JOHN SYER BRISTOWE, Catalepsy and Somnambulism by THOMAS KING CHAM-, Apoplexy by J. HUGHLINGS JACKSON, Angina Pectoris by Professor GAIRDNER, Emphy- of the Lungs by Sir WILLIAM JENNER, etc etc. All the leading schools in Great Britain contributed their best men in generous rivalry, to build up this monument of medical sci- St. Bartholomew's, Guy's, St Thomas's, University College, St Mary's in London, while nburgh, Glasgow, and Manchester schools are equally well represented, the Army Medical l at Netley, the military and naval services, and the public health boards. That a work ived in such a spirit, and carried out under such auspices should prove an indispensable ry of facts and experience, suited to the daily wants of the practitioner, was inevitable, and ccess which it has enjoyed in England, and the reputation which it has acquired on this of the Atlantic, have sealed it with the approbation of the two pre-eminently practical nations. large size and high price having kept it beyond the reach of many practitioners in this try who desire to possess it, a demand has arisen for an edition at a price which shall ren- accessible to all. To meet this demand the present edition has been undertaken. The lumes and five thousand pages of the original will. by the use of a smaller type and double, be compressed into three volumes of about three thousand pages, clearly and hand- y printed, and offered at a price which will render it one of the cheapest works ever pre- to the American profession.

t not only will the American edition be more convenient and lower priced than the English; also be better and more complete. Some years having elapsed since the appearance of a of the work, additions will be required to bring up the subjects to the existing condition nce. Some diseases, also, which are comparatively unimportant in England, require more te treatment to adapt the articles devoted to them to the wants of the American physi- and there are points on which the received practice in this country differs from that abroad. The supplying of these deficiencies has been undertaken by HENRY HARTS-, M.D., late Professor of Hygiene in the University of Pennsylvania, who will endeavor r the work fully up to the day, and as useful to the American physician as it has proved his English brethren. The number of illustrations will also be largely increased, and t will be spared to render the typographical execution unexceptionable in every respect. and second volumes are now ready, and the completion of the whole may be expected y.

ALFRED STILLÉ, M D., Prof. of Theory and ice of Medicine and of Clinical Medicine in ersity of Pennsylvania.

ynolds's System of Medicine has been familiar nce the publication of its first volume. It the best work in English on the subjects ised, and the succeeding volumes have more ne out the promise of the first. Its distinc- rit is that every article is a monograph pre- by an expert, and, for the most part, in a very r manner. I have always recommended it anced students in medicine and to physicians; gh the cost of the English edition limited the r of its purchasers. Mr. Lea deserves thanks having rendered more accessible to American s a work of such exceptionable merit.

J. M. DACOSTA, M D., Prof. of Practice of Medicine in Jeff Med. College. Phila.

I have been familiar with Reynolds's System of icine for several years, and know of no work in English language more thorough and complete.

S D. GROSS, M.D., LL.D , D.C L. Oxon., Prof of Institutes and Practice of Surgery in Jeff Med. College, Phila.

Reynolds's System of Medicine has been familiar to me ever since the publication of its first edition, and I have always spoken of it as a worthy successor to Forbes's celebrated Cyclopedia and Tweedie's Library, which so long maintained their place in the esteem and confidence of British and American physicians. The present production is an elaborate and exhaustive one, reflecting the latest learning, science, and experience of a large number of the most matured and cultured minds of England, Ireland, and Scotland; it is a work of rare merit, in which every article is fully brought up to the existing state of the science of which it treats, and occupies the same high rank among physicians that Holmes's Surgery does among surgeons. The learned American editor's additions contribute materially to the value of the work—nothing seems to have escaped his critical eye. The republication of such a work cannot fail to be of great benefit to our profession.

From ROBERTS BARTHOLOW, M.D., Prof. of Materia Medica and General Therapeutics in Jeff. Med. College, Philadelphia.

Reynolds's System of Medicine represents the most advanced and scientific phase of medicine, and is a work of such a high order that it ought to be in the hands of all American physicians.

FINLAYSON (JAMES), M.D.,

Physician and Lecturer on Clinical Medicine in the Glasgow Western Infirmary, etc.

CLINICAL DIAGNOSIS; A Handbook for Students and P titioners of Medicine. In one handsome 12mo. volume, of 546 pages, with 85 illu tions. Cloth, $2 63. (*Just Ready.*)

The book is an excellent one, clear, concise, convenient, practical. It is replete with the very knowledge the student needs when he quits the lecture-room and the laboratory for the ward and sick-room, and does not lack in information that will meet the wants of experienced and older men.—*Phila. Med. Times*, Jan. 4, 1879.

The aim of the author is to teach a student and practitioner how to examine a case so as to use "*all his knowledge*" in arriving at a diagnosis. All the various symptoms of the several systems are grouped together in such a manner as to make their relations to a final diagnosis clear and easy of apprehension. This work has been done by men of large experience and trained observation, who have been long recognized as authorities upon the subjects which they treat. There is a profusion of illustrations to trate subjects under discussion. The applic electricity, and instruments of precision in dia is fully discussed. This book is all good. We mend it to all students and practitioners of as a work worthy of a place in their libraries.—*Med. Recorder*, Dec. 1878.

This is one of the really useful books. It is tive from preface to the final page, and ought given a place on every office table, because it co in a condensed form all that is valuable in seme and diagnostics to be found in bulkier volum because in its arrangement and complete index unusually convenient for quick reference in emergency that may come upon the busy practi —*N. C. Med. Journ.*, Jan. 1879.

HAMILTON (ALLAN McLANE), M.D.,

Attending Physician at the Hospital for Epileptics and Paralytics, Blackwell's Island, and at the Out-Patients' Department of the New York Hospital.

NERVOUS DISEASES; THEIR DESCRIPTION AND TREATME In one handsome octavo volume of 512 pages, with 53 illus.; cloth, $3 50. (*Now Re*

This is unquestionably the best and most complete text-book of nervous diseases that has yet appeared, and were international jealousy in scientific affairs at all possible, we might be excused for a feeling of chagrin that it should be of American parentage. This work, however, has been performed in New York, and has been so well performed that no room is left for anything but commendation. With great skill, Dr. Hamilton has presented to his readers a succinct and lucid survey of all that is known of the pathology of the nervous system, viewed in the light of the most recent researches. From the preliminary description of the methods of examination and study, and of the instruments of precision employed in the investigation of nervous diseases, up till the final collection of formulæ, the book is eminently practical. — *Brain*, London, Oct. 1878.

The author tells us in his preface that it has been his object to produce a concise, practical book, and we think he has been successful, considering the extent of the subject which he has undertaken. In fact, it is more extensive than the title properly or accurately indicates, embracing—besides what are usually regarded as nervous diseases—inflammatory affections, both acute and chronic, hemorrhag tumors of the cerebrum and cerebellum, me oblongata, spinal cord and nerves, with thr and embolism of the arteries, sinuses, and The reader may therefore expect information, or less full and satisfactory, on almost every connected with the nervous system. We ha hesitation in saying that reliance may be pla Dr. Hamilton's conscientious performance of hi assigned task, on his soundness of judgment, freedom from empiricism.—*Edinburgh Med. J* Oct. 1878.

From a very careful examination of the work, we can justly say that the author has no clearly and fully treated of diagnosis and trea but, unlike most works of this class, it is very prehensive in regard to etiology, and expo pathology of nervous diseases in the light of th latest experiments and discoveries. The dra are excellent and well selected. After this c revision, we can heartily recommend this wo students and general practitioners in particu being a full exposition of diseases of the nervo tem, their pathology and treatment, to date.—*Med. Record*, Aug. 3, 1878.

CHARCOT (J. M.),

Professor to the Faculty of Med. Paris, Phys. to La Salpêtrière, etc.

LECTURES ON DISEASES OF THE NERVOUS SYSTEM. Tr lated from the Second Edition by GEORGE SIGERSON, M.D., M.Ch., Lecturer on Bio etc., Cath. Univ. of Ireland. With illustrations. 1 vol. 8vo. of 288 pages. Cloth, $ (*Just Ready.*)

SMITH (*J. LEWIS*), *M.D.*,

Clinical Professor of Diseases of Children in the Bellevue Hospital Med. College, N Y.

A COMPLETE PRACTICAL TREATISE ON THE DISEASES OF CHILDREN.

Fourth Edition, revised and enlarged. In one handsome octavo volume of about 750 pages, with illustrations. Cloth, $4 50; leather, $5 50. (*Now Ready.*)

The very marked favor with which this work has been received wherever the English language is spoken, has stimulated the author, in the preparation of the Fourth Edition, to spare no pains in the endeavor to render it worthy in every respect of a continuance of professional confidence. Many portions of the volume have been rewritten, and much new matter introduced, but by an earnest effort at condensation, the size of the work has not been materially increased.

In the period which has elapsed since the third edition of the work, so extensive have been the advances that whole chapters required to be rewritten, and hardly a page could pass without some material correction or addition. This labor has occupied the writer closely, and he has performed it conscientiously, so that the book may be considered a faithful portraiture of an exceptionally wide clinical experience in infantile diseases, corrected by a careful study of the recent literature of the subject.—*Med. and Surg. Reporter*, April 5, 1879.

It is scarcely necessary for us to say the work before us is a standard work upon diseases of children, and that no work has a higher standing than it upon those affections. In consequence of its thorough revision, the work has been made of more value than ever, and may be regarded as fully abreast of the times. We cordially commend it to students and physicians There is no better work in the language on diseases of children.—*Cincinnati Med. News*, March, 1879.

The author has evidently determined that it shall not lose ground in the esteem of the profession for want of the latest knowledge on that important department of medicine. He has accordingly incorporated in the present edition the useful and practical results of the latest study and experience, both American and foreign, especially those bearing on therapeutics. Altogether the book has been greatly improved, while it has not been greatly increased in size.—*New York Medical Journal*, June, 1879.

This excellent work is so well known that an extended notice at this time would be superfluous. The author has taken advantage of the demand for another new edition to revise in a most careful manner the entire book; and the numerous corrections and additions evince a determination on his part to keep fully abreast with the rapid progress that is being made in the knowledge and treatment of children's diseases. By the adoption of a somewhat closer type, an increase in size of only thirty pages has been necessitated by the new subject matter introduced.—*Boston Med. and Surg. Jour.*, May 29, 1879.

Probably no other work ever published in this country upon a medical subject has reached such a heighth of popularity as has this well-known treatise. As a text and reference-book it is pre-eminently the authority upon diseases of children. It stands deservedly higher in the estimation of the profession than any other work upon the same subject.—*Nashville Journ. of Med. and Surg.*, May, 1879.

The author of this work has acquired an immense experience as physician to three of the large charities of New York in which children are treated. These asylums afford unsurpassed opportunities for observing the effects of different plans of treatment, and the results as embodied in this volume may be accepted with faith, and should be in the possession of all practitioners *now*, in view of the approaching season when the diseases of children always increase.—*Nat. Med. Review*, April, 1879.

SWAYNE (*JOSEPH GRIFFITHS*), *M.D.*,

Physician-Accoucheur to the British General Hospital, &c.

OBSTETRIC APHORISMS FOR THE USE OF STUDENTS COMMENCING MIDWIFERY PRACTICE

Second American, from the Fifth and Revised London Edition with Additions by E. R. HUTCHINS, M.D. With Illustrations. In one neat 12mo. volume. Cloth, $1 25. (*Lately Issued.*)

THE PATHOLOGY AND TREATMENT OF VENEREAL D

**EASES. Including the results of recent investigations upon the subject. Fourth edi
revised and largely rewritten with the co-operation of R. W. Taylor, M.D., of
York, Prof. of Dermatology in the Univ. of Vt. In one large and handsome o
volume of 835 pages, with 138 illustrations. Cloth, $4 75; leather, $5 75 (*Just Re***

**This work, on its first appearance, immediately took the position of a standard authori
its subject wherever the language is spoken, and the success of an Italian translation
that it is regarded with equal favor on the Continent of Europe. In repeated editions the a
labored sedulously to render it more worthy of its reputation, and in the present revisio
pains have been spared to perfect it as far as possible. Several years having elapsed
the publication of the third edition, much material has been accumulated during the int
by the industry of syphilologists, and new views have been enunciated. All this so f
confirmed by observation and experience, has been incorporated; many portions of the vo
been rewritten, the series of illustrations has been enlarged and improved, and the whole
be regarded rather as a new work than as a new edition. It is confidently presented as full
a level with the most advanced condition of syphilology, and as a work to which the pr
tioner may refer with the certainty of finding clearly and succinctly set forth whatever
within the scope of such a treatise.**

However valuable the previous editions have been, the present is, to our thinking, decidedly of more worth. An air of completeness—of having had garnered into its pages all the best fruit of the world's experience and research upon the subject of which it treats—has been given to the book, without in any way detracting from the peculiarly practical value of previous editions. None the less clinical, the treatise seems much more cosmopolitan. The possession of old editions will be no excuse to the progressive physician for not purchasing this edition, and we predict for it a very speedy sale. We congratulate Dr. Bumstead on the wisdom which led to the selection of Dr. Taylor as colleague, and we sincerely congratulate the two coworkers upon the results of their labor.—*Philadelphia Medical Times*, Dec. 6, 1879.

As it now stands, this is the only complete modern work devoted exclusively to the discuss
venereal diseases. It was needed, and will b
dially welcomed by all who desire to keep
with the times in their knowledge of these su
It is one of the few really good books need

spared to make it a complete treatise on the most advanced condition of its important su**

A work which has reached a fourth edition, and that, too, in the short space of five years, has achieved a reputation which places it almost beyond the reach of criticism, and the favorable opinions which we have already expressed of the former editions seem to require that we should do little more than announce this new issue. We cannot refrain from saying that, as a practical work, this is second to none in the English, or, indeed, in any other language. The arrangement of the contents, the admirably clear manner in which the subject of the differential diagnosis of several of the diseases is handled, leave nothing to be desired by the practitioner who wants a thoroughly clinical work, one to which he can refer in difficult cases of doubtful diagnosis with the certainty of gaining light and instruction. Dr. Thomas is a man with a very clear head and decided views, and there seems to be nothing which he so much dislikes as hazy notions of diagnosis and blind routine and unreasonable therapeutics. The student who will thoroughly study this book and test its principles by clinical observation, will certainly not be guilty of these faults.—*London Lancet*, Feb. 13, 1875.

Reluctantly we are obliged to close this unsatisfactory notice of so excellent a work, and in conclusion would remark that, as a teacher of gynæcology, both didactic and clinical, Prof. Thomas has certainly taken the lead far ahead of his *confrères*, and as an author he certainly has met with unusual and merited success.—*Am. Journ. of Obstetrics*, Nov. 1874.

This volume of Prof. Thomas in its revised form is classical without being pedantic, full in the
of anatomy and pathology, without pos
translation of pages of German literature. de
distinctly the details and difficulties of each
tion, without wearying and useless minutiæ,
in all respects a work worthy of confidence.
ing the high regard in which its distingui
thor is held by the profession.—*Am. Supp*
Obstet. Journ., Oct. 1874.

Professor Thomas fairly took the Professio
United States by storm when his book first
appearance early in 1868. Its reception was
enthusiastic, notwithstanding a few adver
cisms from our transatlantic brethren, the fi
edition was rapidly exhausted, and in six m
second one was issued, and in two years a th
was announced and published, and we are
mised the fourth. The popularity of this wo
not ephemeral, and its success was unpreced
the annals of American medical literature. Si

BARNES (*ROBERT*), *M.D.*, *F.R.C.P.*,

Obstetric Physician to St. Thomas's Hospital, &c.

A CLINICAL EXPOSITION OF THE MEDICAL AND SU

CAL DISEASES OF WOMEN. Second American, from the Second Enlarged and R
English Edition. In one handsome octavo volume, of 784 pages, with 181 illustra
Cloth, $4 50; leather, $5 50. (*Just Ready.*)

The call for a new edition of Dr. Barnes's work on the Diseases of Females has encou
the author to make it even more worthy of the favor of the profession than before. By a
rangement and careful pruning space has been found for a new chapter on the Gynæcolo
Relations of the Bladder and Bowel Disorders, without increasing the size of the book,
many new illustrations have been introduced where experience has shown them to be needed
is therefore hoped that the volume will be found to reflect thoroughly and accurately the pr
condition of gynæcological science.

Dr Barnes stands at the head of his profession in the old country, and it requires but scant scrutiny of his book to show that it has been sketched by a master. It is plain, practical common sense; shows very deep research without being pedantic; is eminently calculated to inspire enthusiasm without inculcating rashness; points out the dangers to be avoided as well as the success to be achieved in the various operations connected with this branch of medicine; and will do much to smooth the rugged path of the young gynæcologist and relieve the perplexity of the man of mature years.—*Canadian Journ. of Med. Science*, Nov. 1878.

We pity the doctor who, having any considerable practice in diseases of women, has no copy of "Barnes" for daily consultation and instruction. It is at once a book of great learning, research, and individual experience, and at the same time eminently practical. That it has been appreciated by the profession, both in Great Britain and in this country, is shown by the second edition following so soon upon the first.—*Am. Practitioner*, Nov. 1878.

Dr Barnes's work is one of a practical character, largely illustrated from cases in his own experience, but by no means confined to such, as will be learned from the fact that he quotes from no less than 628 medical authors in numerous countries. Coming from such an author, it is not necessary to say that the work is a valuable one, and should be la
consulted by the profession.—*Am. Supp Obste*
Journ. Gt. Britain and Ireland, Oct. 1878.

No other gynæcological work holds a higher
tion, having become an authority everywhe
diseases of women. The work has been br
fully abreast of present knowledge. Every p
tioner of medicine should have it upon the sh
of his library, and the student will find it a sup
text-book.—*Cincinnati Med. News*, Oct. 1878.

This second revised edition, of course, deserv
the commendation given to its predecessor, wit
additional one that it appears to include all or n
all the additions to our knowledge of its subject
have been made since the appearance of the fir
tion The American references are, for an En
work, especially full and appreciative, and we
cordially recommend the volume to American
ers.—*Journ. of Nervous and Mental Disease*,
1878.

This second edition of Dr. Barnes's great
comes to us containing many additions and impr
ments which bring it up to date in every fea

MMET (*THOMAS ADDIS*), *M.D.*

Surgeon to the Woman's Hospital, New York, etc.

HE PRINCIPLES AND PRACTICE OF GYNÆCOLOGY, for the use of Students and Practitioners of Medicine. In one large and very handsome octavo volume of 856 pages, with 130 illustrations. Cloth, $5; leather, $6. (*Now Ready.*)

ay be said that he has had opportunities for ation and experience, for unfettered and un- ined experimentation, and for testing the s of the original and dazzling operations first ed and performed by his illustrious predeces- before referred to, and for devising new operations and discovering pathological causes never suspected or described, which no man in the sion has ever before secured. We also think the readers of this work will agree with us, is careful perusal that he has a rare capacity criminating analysis, and generally for phi- ical deduction and the equally important y of patient, honest, continued work. For the as a whole, we have only praise. It deserves il receive the careful study of all who desire pon a level with the progress of Gynæcology. dies a larger amount of carefully analyzed l experience in a unique field for observa- n any volume on Diseases of Women which been published. Its great merit consists in ing as it does from a thoroughly honest, t and able specialist, who became a spe- ly after an excellent training and experi- a general hospital physician and surgeon. k is not one to be hastily glanced over, but re the critical study of Gynæcologists. Not only its style, which is individual and somewhat peculiar, but the new facts which it brings out, its original suggestions, its numerous and important statistical tables, and, in some instances, its unexpected deductions, will compel attention, and will form the basis for a great deal of Gynæcological study and literature in the future. All who make themselves familiar with the contents of this volume, will feel assured that Dr Emmet has well earned and well deserved the reputation which he has already won, as one of the great Gynæcologists of the present age.—*The Am. Journ. of Obstetrics*, April, 1879.

We have examined this book with something more than ordinary care, and now lay it aside captivated by our impressions of it. From first to last, each page grows in interest, and one is struck with the practical tone of all that is said. It is indeed the gynæcological work for the practitioner. Its equal is not yet published, or at least we have not seen it. We cannot send this notice forward without reiterating that, in our estimation, Emmet's Principles and Practice of Gynæcology is undoubtedly the best book for the student, as well as the general practitioner, which is at present published.—*Va. Med. Monthly*, May, 1879.

E PRINCIPLES AND PRACTICE OF OBSTETRIC MEDI CINE AND SURGERY, in reference to the Process of Parturition. A new and enlarged edition, thoroughly revised by the author. With additions by W. V. KEATING, M. D., Professor of Obstetrics, &c., in the Jefferson Medical College, Philadelphia. In one large and handsome imperial octavo volume of 650 pages, strongly bound in leather, with raised bands; with sixty-four beautiful plates, and numerous wood-cuts in the text, containing in all nearly 200 large and beautiful figures. $7 00.

NCKEL (*F.*),

Professor and Director of the Gynæcological Clinic in the University of Rostock.

A COMPLETE TREATISE ON THE PATHOLOGY AND TREATMENT OF CHILDBED, for Students and Practitioners. Translated, with the consent of the author, from the Second German Edition, by JAMES READ CHADWICK, M.D. In one octavo volume. Cloth, $4 00. (*Lately Issued.*)

NNER (*THOMAS H.*), *M.D.*

ON THE SIGNS AND DISEASES OF PREGNANCY. First American from the Second and Enlarged English Edition. With four colored plates and illustrations on wood. In one handsome octavo volume of about 500 pages, cloth, $4 25.

PLAYFAIR (W. S.), M.D., F.R.C.P.,

Professor of Obstetric Medicine in King's College, etc. etc.

A TREATISE ON THE SCIENCE AND PRACTICE OF MIDWIF

Third American edition, revised by the author. Edited, with additions, by Ro HARRIS, M.D. In one handsome octavo volume of about 700 pages, with near illustrations. Cloth, $4; leather, $5 (*Just Ready*)

EXTRACT FROM THE AUTHOR'S PREFACE.

The second American edition of my work on Midwifery being exhausted before the c sponding English edition, I cannot better show my appreciation of the kind reception my has received in the United States than by acceding to the publisher's request that I s myself undertake the issue of a third edition. As little more than a year has elapsed the second edition was issued, there are naturally not many changes to make, but I nevertheless, subjected the entire work to careful revision, and introduced into it a n most of the more important recent additions to obstetric science. To the operation of elytrotomy—formerly described along with the Cæsarean section—I have now devoted a rate chapter. The editor of the Second American edition, Dr. Harris, enriched it with valuable notes, of which, it will be observed, I have freely availed myself.

A few notices of the previous edition are subjoined.

The best work on the subject ever published in the English language. It is written in a clear, pleasant style, without that verbosity which characterizes some modern and highly pretentious works. The author is quite up with the times, both in practice and theory. It is the best text-book we have for students, and sufficiently full of detail to supply all the wants of the practitioner. We would gladly see it in the hands of all who practise midwifery.—*Canadian Journ. of Med. Sci.*, Nov. 1878.

There has been a general unanimity of op the profession as to the high character of Dr fair's work, both as a manual for the stud a book of reference for the practitioner; a revision and additions made to the second will not lower this favorable estimate of additions made by Dr. Harris are of such acter as to make us wish they were more ber and greater in extent.—*Am. Journ. of Sciences*, Jan. 1879.

BARNES (FANCOURT), M.D.,

Physician to the General Lying-in Hospital, London.

A MANUAL OF MIDWIFERY FOR MIDWIVES AND MEDIC STUDENTS. With 50 illustrations. In one neat royal 12mo. volume of 200 p cloth, $1 25. (*Now Ready.*)

The book is written in plain, and as far as possible in untechnical language. Any intelligent midwife or medical student can easily comprehend the directions It will undoubtedly fill a want, and will be popular with those for whom it has been prepared. The examining questions at the back will be found very useful.—*Cincinnati Med. News*, Aug. 1879.

The style is clear, and the book will, do be useful to the persons for whom it is inte *London Med. Times and Gazette*, Aug. 30, 1

The book is written with as little technic guage as possible. Any intelligent midwife ical student can easily understand the dir It will undoubtedly be found very useful *Med. Recorder*, Sept. 1879.

THE OBSTETRICAL JOURNAL. (*Free of postage for* 1880.)

THE OBSTETRICAL JOURNAL of Great Britain and Irel

Including MIDWIFERY, and the DISEASES OF WOMEN AND INFANTS. A month 64 octavo pages, very handsomely printed. Subscription, Three Dollars per an Single Numbers, 25 cents each.

With the January number will terminate Vol. VII. of the Obstetrical Journal. The No. of Vol. VIII. will be issued about Feb. 1st; the "AMERICAN SUPPLEMENT" of 16 per No. will be discontinued, and the periodical will thenceforth consist of 64 pages per nu at the exceedingly low price of THREE DOLLARS per annum, free of postage. For this tri sum the subscriber will thus obtain more than 750 pages per annum, containing an extent variety of information which may be estimated from the fact that Vol. VI. of the "OBSTE CAL JOURNAL" contains in

rnal*, Jan. 1880.

We gladly welcome the new edition of this excellent text-book of midwifery. The former editions have been most favorably received by the profession on both sides of the Atlantic In the preparation of the present edition the author has made such alterations as the progress of obstetrical science seems to require, and we cannot but admire the ability with which the task has been performed. We consider it an admirable text-book for students during their attendance upon lectures, and have great pleasure in recommending it. As an exponent of the midwifery of the present day it has no superior in the English language.—*Canada Lancet*, Jan. 1880.

The book is greatly improved, and as such will be welcomed by those who are trying to keep posted in the rapid advances which are being made in the study of obstetrics.—*Boston Med. and Surg Journ.*, Nov. 27, 1879.

GROSS (SAMUEL D.), M.D.,

Professor of Surgery in the Jefferson Medical College of Philadelphia.

SYSTEM OF SURGERY: Pathological, Diagnostic, Therape

and Operative. Illustrated by upwards of Fourteen Hundred Engravings. Fifth ed carefully revised, and improved. In two large and beautifully printed imperial octav umes of about 2300 pp., strongly bound in leather, with raised bands, $15. (*Just Is*

The continued favor, shown by the exhaustion of successive large editions of this great w proves that it has successfully supplied a want felt by American practitioners and students. the present revision no pains have been spared by the author to bring it in every respect, up tc the day. To effect this a large part of the work has been rewritten, and the whol arged by nearly one-fourth, notwithstanding which the price has been kept at its former moderate rate. By the use of a close, though very legible type, an unusually large amou matter is condensed in its pages, the two volumes containing as much as four or five ordi octavos. This, combined with the most careful mechanical execution, and its very durable ing renders it one of the cheapest works accessible to the profession. Every subject pre belonging to the lomain of surgery is treated in detail, so that the student who possess work may be said to have in it a surgical library.

We have now brought our task to a conclusion, and have seldom read a work with the practical value of which we have been more impressed. Every chapter is so concisely put together. that the busy practitioner, when in difficulty, can at once find the information he requires. His work, on the contrary, is cosmopolitan, the surgery of the world being fully represented in it. The work, in fact, is so historically unprejudiced, and so eminently practical, that it is almost a false compliment to say that we believe it to be destined to occupy a foremost place as a work of reference, while a system of surgery like the present system of surgery is the practice of surgeons. The printing and binding of the work is unexceptionable; indeed, it contrasts, in the latter respect, remarkably with English medical and surgical cloth-bound publications, which are generally so wretchedly stitched as to require re-binding before they are any time in use.—*Dub. Journ. of Med. Sci.*, March, 1874.

Dr. Gross's Surgery, a great work, has become still greater, both in size and merit, in its most recent form. The difference in actual number of pages is not more than 130, but the size of the page having been increased to what we believe is technically termed "elephant," there has been room for considerable additions, which, together with the alterations, are improvements.—*Lond. Lancet*, Nov. 16, 1872.

It combines, as perfectly as possible, the qualities of a text-book and work of reference. We think this last edition of Gross's "Surgery," will confirm his " *Primus inter Pares.*" It is learned, scholar-m thodical, precise, and exhaustive. We scarcely any living man could write so complete and fa treatise, or comprehend more solid, instructive in the given number of pages. The labor mu been immense, and the work gives evidence powers of mind, and the highest order of int discipline and methodical disposition, and arra of acquired knowledge and personal experien *Med. Journ.*, Feb. 1873.

As a whole, we regard the work as the represe "System of Surgery" in the English langua *Louis Medical and Surg. Journ.*, Oct. 1872.

. The two magnificent volumes before us afford complete view of the surgical knowledge of t Some years ago we had the pleasure of presen first edition of Gross's Surgery to the profess work of unrivalled excellence; and now we h result of years of experience, labor, and study, densed upon the great work before us. And to or practitioners desirous of enriching their lib a treasure of reference, we can simply comm purchase of these two volumes of immense re *Cincinnati Lancet and Observer*, Sept. 1872.

A complete system of surgery—not a mere t of operations, but a scientific account of surgic and practice in all its departments.—*Brit.* *Med. Chir. Rev.*, Jan. 1873.

BY THE SAME AUTHOR.

A PRACTICAL TREATISE ON THE DISEASES, INJUR

and Malformations of the Urinary Bladder, the Prostate Gland, and the Urethra. Edition, thoroughly Revised and Condensed, by SAMUEL W. GROSS, M.D., Surg the Philadelphia Hospital. In one handsome octavo volume of 574 pages, with 17 trations: cloth, $4 50. (*Just Issued.*)

For reference and general information, the physician or surgeon can find no work that meets their necessities more thoroughly than this, a revised edition of an excellent treatise, and no medical library should be without it. Replete with handsome illustrations and good ideas, it has the unusual advantage of being easily comprehended, by the reasonable and practical manner in which the various subjects are systematized and arranged We heartily recommend it to the profession as a valuable addition to the important literature of diseases of the urinary organs.—*Atlanta Med. Jour* 1876.

It is with pleasure we now again take up t work in a decidedly new dress. Indeed, it mus garded as a new book in very many of its part chapters on "Diseases of the Bladder," "F Body," and "Lithotomy," are splendid speci descriptive writing; while the chapter on "St is one of the most concise and clear that we hav read.—*New York Med. Journ.*, Nov. 1876.

BY THE SAME AUTHOR.

A PRACTICAL TREATISE ON FOREIGN BODIES IN T

AIR-PASSAGES. In 1 vol. 8vo., with illustrations, pp. 468, cloth, $2 75.

DRUITT (ROBERT), M.R.C.S., &c.

THE PRINCIPLES AND PRACTICE OF MODERN SURGE

A new and revised American, from the eighth enlarged and improved London edition. trated with four hundred and thirty-two wood engravings. In one very handsome volume, of nearly 700 large and closely printed pages, cloth, $4 00; leather, $5 00.

All that the surgical student or practitioner could desire.—*Dublin Quarterly Journal.*

It is a most admirable book. We do not know when we have examined one with more pleasure.—*Boston Med. and Surg. Journal.*

In Mr. Druitt's book, though containing only some seven hundred pages, both the principles and the practice of surgery are treated, and so clear perspicuously, as to elucidate every importan We have examined the book most thorough can say that this success is well merited. Hi moreover, possesses the inestimable advant having the subjects perfectly well arrange classified and of being written in a style a clear and succinct.—*Am. Journal of Med. Sci*

HHURST (JOHN, Jr.), M.D.,

Prof. of Clinical Surgery, Univ of Pa., Surgeon to the Episcopal Hospital, Philadelphia

HE PRINCIPLES AND PRACTICE OF SURGERY.

Second edition, enlarged and revised. In one very large and handsome octavo volume of over pages, with 542 illustrations. Cloth, $6; leather, $7. (*Just Ready.*)

tiousness and thoroughness are two very traits of character in the author of this of these traits largely has grown the his mental fruit in the past, and the pre- seems in no wise an exception to what has The general arrangement of the vol- same as in the first edition, but every part carefully revised, and much new matter —*Phila. Med. Times*, Feb. 1, 1879.

ve previously spoken of Dr. Ashhurst's terms of praise. We wish to reiterate those e, and to add that no more satisfactory ation of modern surgery has yet fallen press. In point of judicial fairness, of condensation, of accuracy and conciseness and thoroughly good English, Prof. has no superior among the surgical writers —*Am. Practitioner*, Jan. 1879.

pt to embrace in a volume of 1000 pages field of surgery, general and special, hopeless task unless through the most stry in collating and arranging, and judgment in condensing and excluding. have been abundantly employed by , and he has given us a most excellent ught up by the revision for the second the latest date. Of course this book is not for specialists, but as a course of general knowledge and for general practitioners, text-book for students it is not surpassed has yet appeared, whether of home or authorship.—*N. Carolina Med. Journal*,

Ashhurst's Surgery is too well known in this country to require special commendation from us. This, its second edition, enlarged and thoroughly revised, brings it nearer our idea of a model text-book than any recently published treatise. Though numerous additions have been made, the size of the work is not materially increased The main trouble of text-books of modern times is that they are too cumbersome. The student needs a book which will furnish him the most information in the shortest time. In every respect this work of Ashhurst is the model text-book—full, comprehensive and compact.—*Nashville Jour. of Med. and Surg.*, Jan. '79.

The favorable reception of the first edition is a guarantee of the popularity of this edition, which is fresh from the editor's hands with many enlargements and improvements. The author of this work is deservedly popular as an editor and writer, and his contributions to the literature of surgery have gained for him wide reputation. The volume now offered the profession will add new laurels to those already won by previous contributions. We can only add that the work is well arranged, filled with practical matter, and contains in brief and clear language all that is necessary to be learned by the student of surgery whilst in attendance upon lectures, or the general practitioner in his daily routine practice.—*Md. Med. Journal*, Jan. 1879.

The fact that this work has reached a second edition so very soon after the publication of the first one, speaks more highly of its merits than anything we might say in the way of commendation. It seems to have immediately gained the favor of students and physicians.—*Cincin. Med. News*, Jan. '79.

ANT (THOMAS), F.R.C.S.,

Surgeon to Guy's Hospital.

E PRACTICE OF SURGERY.

Second American, from the Sec- and Revised English Edition. With Six Hundred and Seventy-two Engravings on ood. In one large and very handsome imperial octavo volume of over 1000 large and ely printed pages. Cloth, $6; leather, $7. (*Just Ready.*)

rk has enjoyed the advantage of two thorough revisions at the hand of the author since rance of the first American edition, resulting in a very notable enlargement of size and ent of matter. In England this has led to the division of the work into two volumes, here comprised in one, the size being increased to a large imperial octavo, printed on d but clear type. The series of illustrations has undergone a like revision, and will correspondingly improved.

ked success of the work on both sides of the Atlantic shows that the author has suc- the effort to give to student and practitioner a sound and trustworthy guide in the f Surgery; while the simultaneous appearance of the present edition in England and try affords to the American reader the benefit of the most recent advances made rgical science.

s many text-books of surgery, so many lled and distinguished hands, that to ob of a third edition in England is no light ryant merits this, by clearness of style, ent in selecting the operations he re- in his new editions he goes carefully over s, in light of later research. On these ed points, Mr. Bryant is a calm and un- erver, and his book throughout has the of maintaining the true scientific, judicial .—*Med. and Surg. Reporter*, March 22,

before us is the American reprint of the edition, and has the advantage over the ing of more convenient size. and in being into one volume. The author has rewrit- ter part of the work, and has succeeded, t of new matter added, in making it mark- tive from previous editions. A few extra been added, and also a few new illustrations The publishers have presented the work style. As a concise and practical manual rgery it is perhaps without an equal, and always be a favorite text-book with the practitioner.—*N. Y. Med. Record*, March

Another edition of this manual having been called for, the author has availed himself of the opportunity to make no few alterations in the substance as well as in the arrangement of the work, and, with a view to its improvement, has recast the materials and revised the whole. We ourselves are of the opinion that there is no better work on surgery extant.—*Cincinnati Med. News*, March, 1879.

Bryant's Surgery has been favorably received from the first, and evidently grows in the esteem of the profession with each succeeding edition. In glancing over the volume before us we find proof in almost every chapter of the thorough revision which the work has undergone, many parts having been cut out and replaced by matter entirely fresh.—*N. Y. Med. Journ.*, April, 1879.

Welcome as the new edition is, and as much as it is entitled to commendation, yet its appearance at this time is, in a certain sense, a matter of regret, as it will be in competition with another work, lately issued from the same press. But, the difficult task of forming a judgment as to the relative merits of Bryant and Ashhurst we will not attempt, but predict that, considering the high excellence of both, many others will likewise be forced to hesitate long in making choice between them.—*Cincinnati Lancet and Clinic*, March 22, 1879.

ERICHSEN (JOHN E.),

Professor of Surgery in University College, London, etc.

THE SCIENCE AND ART OF SURGERY; being a Treatise on gical Injuries, Diseases, and Operations. Carefully revised by the author fr Seventh and enlarged English Edition. Illustrated by eight hundred and sixty gravings on wood. In two large and beautiful octavo volumes of nearly 2000 cloth, $8 50 ; leather, $10 50. (*Now Ready.*)

In revising this standard work the author has spared no pains to render it worthy of a c ance of the very marked favor which it has so long enjoyed, by bringing it thorough level with the advance in the science and art of surgery made since the appearance last edition. To accomplish this has required the addition of about two hundred pages while the illustrations have undergone a marked improvement. A hundred and fifty add wood-cuts have been inserted, while about fifty other new ones have been substituted for which were not deemed satisfactory. In its enlarged and improved form it is therefo sented with the confident anticipation that it will maintain its position in the front text-books for the student, and of works of reference for the practitioner, while its excee moderate price places it within the reach of all.

The seventh edition is before the world as the last word of surgical science. There may be monographs which excel it upon certain points, but as a conspectus upon surgical principles and practice it is unrivalled. It will well reward practitioners to read it, for it has been a peculiar province of Mr. Erichsen to demonstrate the absolute interdependence of medical and surgical science We need scarcely add, in conclusion, that we heartily commend the work to students that they may be grounded in a sound faith, and to practitioners as an invaluable guide at the bedside.—*Am. Practitioner*, April, 1878.

It is no idle compliment to say that this is the best edition Mr. Erichsen has ever produced of his well-known book. Besides inheriting the virtues of its predecessors, it possesses excellences quite its own. Having stated that Mr. Erichsen has incorporated into this edition every recent improvement in the science and art of surgery, it would be a supererogation to give a detailed criticism. In short, we unhesitatingly aver that we know of no other single work where the student and practitioner can gain at once so clear an insight into the principles of surgery, and so complete a knowledge of the exigencies of surgical practice.—*London Lancet*, Feb. 14, 1878

For the past twenty years Erichsen's Surgery has maintained its place as the leading text-book, not only in this country, but in Great Britain. That it is able to hold its ground, is abundantly proven by the thoroughness with which the present edition has been revised, and by the large amount of valuable material that has been added. Aside from this, one hundred and fifty new illustrations have been inserted, including quite a number of microscopical appearances of pathological processes. So marked is this change for the better, that the work almost appears as an entirely new one.—*Med. Record*, Feb. 23, 1878.

Of the many treatises on Surgery which it i our task to study, or our pleasure to read, ther which in all points has satisfied us so well as t treatise of Erichsen. His polished, clear style dom from prejudice and hobbies, his unsurpa of his subject, and vast clinical experience. qu admirably to write a model text-book. Whe at the least cost of time, to learn the most of surgery, we turn, by preference, to his work. pleasure, therefore, to see that the appreciati general, and has led to the appearance of an tion.—*Med. and Surg. Reporter*, Feb. 2, 1878.

Notwithstanding the increase in size, we obs much old matter has been omitted. The e has been thoroughly written up, and not merel ed by a few extra chapters A great improve been made in the illustrations. One hundred new ones have been added, and many of the have been redrawn. The author highly appre favor with which his work has been received b can surgeons, and has endeavored to render edition more than ever worthy of their appro he has succeeded admirably, must, we thi general opinion. We heartily recommend t both student and practitioner.—*N. Y. Med.* Feb. 1878.

Erichsen has stood so prominently fo years as a writer on Surgery, that his re world wide, and his name is as familiar t ical student as to the accomplished and ex surgeon. The work is not a reprint of f tions, but has in many places been entire ten. Recent improvements in surgery ha caped his notice, various new operations h thoroughly analyzed, and their merits th discussed. One hundred and fifty new w add to the value of this work.—*N. O. Med.* a *Journal*, March, 1878.

HOLMES (TIMOTHY), M.D.,

Surgeon to St. George's Hospital, London.

SURGERY, ITS PRINCIPLES AND PRACTICE. In one some octavo volume of nearly 1000 pages, with 411 illustrations. Cloth, $6; lea (*Just Issued.*)

This is a work which has been looked for on both sides of the Atlantic with much interest. Mr. Holmes is a surgeon of large and varied experience, and one of the best known, and perhaps the most brilliant writer upon surgical subjects in England. It is a book for students—and an admirable one—and for the busy general practitioner. It will give a student all the knowledge needed to pass a rigid examination. The book fairly justifies the high expectations that were formed of it. Its style is clear and forcible, even brilliant at times, and the conciseness needed to bring it within its proper limits has not impaired its force and distinctness.—*N. Y. Med. Reco* 14, 1876.

It will be found a most excellent epito gery by the general practitioner who ha time to give attention to more minute and works and to the medical student. In fact, of no one we can more cordially recomme author has succeeded well in giving a p practical account of each surgical injury ease, and of the treatment which is monly advisable. It will no doubt become lar work in the profession, and especially a book.—*Cincinnati Med. News*, April, 187

Professor of Fractures and Dislocations, &c., in Bellevue Hosp. Med. College, New York.

A PRACTICAL TREATISE ON FRACTURES AND DISLOCATIONS. Fifth edition, revised and improved. In one large and handsome octavo volume of nearly 800 pages, with 344 illustrations. Cloth, $5 75; leather, $6 75. (*Lately Issued.*)

work is well known, abroad as well as at home, as the highest authority on its important t—an authority recognized in the courts as well as in the schools and in practice—and manifested, not only by the demand for a fifth edition, but by arrangements now in pro- for the speedy appearance of a translation in Germany. The repeated revisions which the has thus had the opportunity of making have enabled him to give the most careful consid- to every portion of the volume, and he has sedulously endeavored in the present issue, st the work by the aid of his own enlarged experience, and to incorporate in it whatever e has been added in this department since the issue of the fourth edition. It will there- e found considerably improved in matter, while the most careful attention has been paid typographical execution, and the volume is presented to the profession in the confident hat it will more than maintain its very distinguished reputation.

is no better work on the subject in existence t of Dr. Hamilton. It should be in the posses- every general practitioner and surgeon.—*The n. of Obstetrics*, Feb. 1876.

ue of a work like this to the practical physi- surgeon can hardly be over-estimated. and the y of having such a book revised to the latest merely on account of the practical importance of its teachings, but also by reason of the medico-legal bearings of the cases of which it treats, and which have recently been the subject of useful papers by Dr. Hamilton and others, is sufficiently obvious to every one. The present volume seems to amply fill all the requisites. We can safely recommend it as the best of its kind in the English language, and not excelled in any other. *Journ. of Nervous and Mental Disease*, Jan. 1876.

WNE (EDGAR A.),

Surgeon to the Liverpool Eye and Ear Infirmary, and to the Dispensary for Skin Diseases.

W TO USE THE OPHTHALMOSCOPE. Being Elementary Instructions in Ophthalmoscopy, arranged for the Use of Students. With thirty-five illustrations. In one small volume royal 12mo. of 120 pages: cloth, $1. (*Now Ready.*)

TER (R. BRUDENELL), F.R.C.S.,

Ophthalmic Surgeon to St. George's Hospital, etc.

PRACTICAL TREATISE ON DISEASES OF THE EYE. Edited, with test-types and Additions, by JOHN GREEN, M.D. (of St. Louis, Mo.). In one handsome octavo volume of about 500 pages, and 124 illustrations. Cloth, $3 75. (*Just Issued.*)

ith great pleasure that we can endorse the work s valuable contribution to practical ophthal- . Mr. Carter never deviates from the end he has , and presents the subject in a clear and concise , easy of comprehension, and hence the more . We would especially commend, however, as of high praise, the manner in which the thera- f disease of the eye is elaborated, for here the s particularly clear and practical, where other are unfortunately too often deficient. The final chapter is devoted to a discussion of the uses and selection of spectacles, and is admirably compact, plain, and useful, especially the paragraphs on the treatment of presbyopia and myopia. In conclusion, our thanks are due the author for many useful hints in the great subject of ophthalmic surgery and therapeutics, a field where of late years we glean but a few grains of sound wheat from a mass of chaff.—*New York Medical Record*, Oct. 23, 1875.

LLS (J. SOELBERG),

Professor of Ophthalmology in King's College Hospital, &c.

TREATISE ON DISEASES OF THE EYE. Third American, from the Fourth and Revised London Edition, with additions; illustrated with numerous engravings on wood, and six colored plates. Together with selections from the Test-types of Jaeger and Snellen. In one large and very handsome octavo volume. (*Preparing.*)

TLESHIP (EDWARD), F.R.C.S.,

Ophthalmic Surg. and Lect. on Ophth. Surg. at St. Thomas' Hospital, London.

NUAL OF OPHTHALMIC MEDICINE. In one royal 12mo. ume of over 350 pages, with 89 illustrations. Cloth, $2. (*Just Ready.*)

BURNETT (CHARLES H.), M.A., M.D.,

Aural Surg to the Presb. Hosp., Surgeon-in-charge of the Infr. for Dis. of the Ear, Ph

THE EAR, ITS ANATOMY, PHYSIOLOGY, AND DISEAS

A Practical Treatise for the Use of Medical Students and Practitioners. In one
some octavo volume of 615 pages, with eighty-seven illustrations: cloth, $4 50; le
$5 50. (*Now Ready.*)

**Recent progress in the investigation of the structures of the ear, and advances made
modes of treating its diseases, would seem to render desirable a new work in which all t
sources of the most advanced science should be placed at the disposal of the practitioner.
it has been the aim of Dr. Burnett to accomplish, and the advantages which he has enjoy
the special study of the subject are a guarantee that the result of his labors will prove of s
to the profession at large, as well as to the specialist in this department.**

Foremost among the numerous recent contributions to aural literature will be ranked this work of Dr. Burnett. It is impossible to do justice to this volume of over 600 pages in a necessarily brief notice. It must suffice to add that the book is profusely and accurately illustrated, the references are conscientiously acknowledged, while the result has been to produce a treatise which will henceforth rank with the classic writings of Wilde and Von Tröltsch.—*The Lond. Practitioner*, May, 1879.

On account of the great advances which have been made of late years in otology, and of the increased interest manifested in it, the medical profession will welcome this new work, which presents clearly and concisely its present aspect, whilst clearly indicating the direction in which further researches can be most profitably carried on. Dr. Burnett from his own matured experience, and availing himself of the observations and discoveries of others, has produced a work, which as a text-book, stands *facile princeps* in our language. We had marked several passages as well worthy of quotation and the attention of the general practitioner, but their number and the space at our command forbid. Perhaps it is better, as the book ought to be in the hands of every
medical student, and its study will well rep
busy practitioner in the pleasure he will deriv
the agreeable style in which many otherwi
and mostly unknown subjects are treated.
specialist the work is of the highest value, an
sense of gratitude to Dr. Burnett will, we ho
proportionate to the amount of benefit he can
from the careful study of the book, and a co
reference to its trustworthy pages.—*Edi
Med. Jour.*, Aug. 1878.

The book is designed especially for the use
dents and general practitioners, and places
disposal much valuable material. Such a b
the present one, we think, has long been need
we may congratulate the author on his succ
filling the gap. Both student and practition
study the work with a great deal of benefit.
profusely and beautifully illustrated.—*N. Y
pital Gazette*, Oct 15, 1877.

Dr. Burnett is to be commended for having
the best book on the subject in the English lan
and especially for the care and attention
given to the scientific side of the subject.—
Med. Journ., Dec. 1877.

TAYLOR (ALFRED S.), M.D.,

Lecturer on Med. Jurisp. and Chemistry in Guy's Hospital.

POISONS IN RELATION TO MEDICAL JURISPRUDENCE

MEDICINE. Third American, from the Third and Revised English Edition.
large octavo volume of 850 pages; cloth, $5 50; leather, $6 50. (*Just Issued.*)

The present is based upon the two previous editions; "but the complete revision rendered necessary by time has converted it into a new work." This statement from the preface contains all that it is desired to know in reference to the new edition. The works of this author are already in the library of every physician who is liable to be called upon for medico-legal testimony (and what one is not?), so that all that is required to be known about the present book is that the author has kept it abreast with the times. What makes it now, as always, especially valuable to the practitioner is its conciseness and practical character, only those poisonous substances
being described which give rise to legal la
tions.—*The Clinic*, Nov. 6, 1875.

Dr. Taylor has brought to bear on the com
of this volume, stores of learning, experien
practical acquaintance with his subject, prob
beyond what any other living authority on t
ogy could have amassed or utilized. He has
sustained his reputation by the consummat
and legal acumen he has displayed in the ar
ment of the subject-matter, and the result is a
on Poisons which will be indispensable to eve
dent or practitioner in law and medicine.—Th
lin Journ. of Med Sci., Oct. 1875.

BY THE SAME AUTHOR.

MEDICAL JURISPRUDENCE. Seventh American Edition. Ed

by JOHN J. REESE, M.D., Prof. of Med. Jurisp. in the Univ. of Penn. In one
octavo volume of nearly 900 pages. Cloth, $5 00; leather, $6 00. (*Lately Iss*

To the members of the legal and medical profession, it is unnecessary to say anything commendatory of Taylor's Medical Jurisprudence. We might as well undertake to speak of the merit of Chitty's Pleadings.—*Chicago Legal News*, Oct. 16, 1873.

It is beyond question the most attractive as well as most reliable manual of medical jurisprudence published in the English language.—*Am. Journal of Syphilography*, Oct. 1873.

It is altogether superfluous for us to offer anything in behalf of a work on medical jurisprudence by an author who is almost universally esteemed to be the
best authority on this specialty in our langua
this point, however, we will say that we consi
Taylor to be the safest medico-legal authority
low, in general, with which we are acquainted
language.—*Va. Clin. Record*, Nov. 1873.

This last edition of the Manual is probably th
of all, as it contains more material and is wor
to the latest views of the author as expressed
last edition of the Principles. Dr. Reese, the
of the Manual, has done everything to mak
work acceptable to his medical countrymen.—
Med. Record, Jan. 15, 1874.

BY THE SAME AUTHOR.

NDFORD (G. FIELDING), M.D., F.R.C.P.,

Lecturer on Psychological Medicine at the School of St. George's Hospital, &c.

SANITY AND ITS TREATMENT: Lectures on the Treatment,

Medical and Legal, of Insane Patients. With a Summary of the Laws in force in the nited States on the Confinement of the Insane. By ISAAC RAY, M. D. In one very andsome octavo volume of 471 pages; cloth, $3 25.

ies a want which must have been sorely he busy general practitioners of this country. the form of a manual of clinical description arious forms of insanity, with a description ode of examining persons suspected of in-. We call particular attention to this feature ok, as giving it a unique value to the gene-itioner. If we pass from theoretical conside-to descriptions of the varieties of insanity as actually seen in practice and the appropriate treatment for them, we find in Dr. Blandford's work a considerable advance over previous writings on the subject. His pictures of the various forms of mental disease are so clear and good that no reader can fail to be struck with their superiority to those given in ordinary manuals in the English language or (so far as our own reading extends) in any other.—*London Practitioner*, Feb. 1871.

A (HENRY C.).

UPERSTITION AND FORCE: ESSAYS ON THE WAGER OF

LAW, THE WAGER OF BATTLE, THE ORDEAL, AND TORTURE. Third Revised and Enlarged Edition. In one handsome royal 12mo. volume of 552 pages. Cloth, $2 50. (*Just Ready.*)

pearance of a new edition of Mr. Henry C. uperstition and Force" is a sign that our cholarship is not without honor in its na-try. Mr. Lea has met every fresh demand ork with a careful revision of it, and the edition is not only fuller and, if possible, urate than either of the preceding, but, thorough elaboration is more like a har-oncert and less like a batch of studies.—, Aug. 1, 1878.

ill be tempted to say that this, like the nd Fall," is one of the uncriticizable books innumerable, its deductions simple and , and its *chevaux-de-frise* of references and dense enough to make the keenest, and best equipped assailant think twice dvancing. Nor is there anything contro-it to provoke assault. The author is no polemic. Though he obviously feels and thinks strongly, he succeeds in attaining impartiality. Whether looked on as a picture or a mirror, a work such as this has a lasting value.—*Lippincott's Magazine*, Oct. 1878.

Mr. Lea's curious historical monographs, of which one of the most important is here reproduced in an enlarged form, have given him an unique position among English and American scholars. He is distinguished for his recondite and affluent learning, his power of exhaustive historical analysis, the breadth and accuracy of his researches among the rarer sources of knowledge, the gravity and temperance of his statements, combined with singular earnestness of conviction, and his warm attachment to the cause of human freedom and intellectual progress.—*N. Y. Tribune*, Aug. 9, 1878.

E SAME AUTHOR. (Lately Published.)

TUDIES IN CHURCH HISTORY—THE RISE OF THE TEM-

PORAL POWER—BENEFIT OF CLERGY—EXCOMMUNICATION. In one large royal 12mo. volume of 516 pp.; cloth, $2 75.

story was never told more calmly or with learning or wiser thought. We doubt, indeed, ther study of this field can be compared with clearness, accuracy, and power.—*Chicago iner*, Dec. 1870.

Lea's latest work, "Studies in Church History," tains the promise of the first. It deals with subjects—the Temporal Power, Benefit of y, and Excommunication, the record of which has a peculiar importance for the English student, and is a chapter on Ancient Law likely to be regarded as final. We can hardly pass from our mention of such works as these—with which that on "Sacerdotal Celibacy" should be included—without noting the literary phenomenon that the head of one of the first American houses is also the writer of some of its most original books.—*London Athenæum*, Jan. 7 1871.

BUMSTEAD ON VENEREAL DISEASES—New Edition—Just Ready.

THE PATHOLOGY AND TREATMENT OF VENEREAL DISEASES: Including the results of recent investigations upon the subject. By FREEMAN J. BUMSTEAD, M.D., LL.D., late Professor of Venereal Diseases in the Coll. of Phys. and Surg., New York, etc. Fourth edition, revised and largely rewritten with the co-operation of R. W. TAYLOR, M.D., of New York. Prof. of Dermatology in the Univ. of Vermont. In one large and handsome 8vo. volume, of 835 pages, with 130 illustrations; cloth, $4 75; leather, $5 75.

Each of the three previous editions, practical handbooks as well as scientific monographs, has ranked *facile princeps* among literary productions in the English language upon these topics. The present edition is a marked advance upon the preceding ones The treatise has lost nothing by the addition of the advanced views, the active brain, and the industrious pen of the new co-editor.—*Boston Med. and Surg. Journ.*, January, 1880.

We find that we have here practically a new book—that the statement of the title-page as to the fact that it has been largely rewritten, is a sufficiently modest announcement for the important changes in the text After a thorough examination of the present edition we can assert confidently that the enormous labor we have described, has been here most faithfully and conscientiously performed. We take pleasure in repeating, that we believe this to be the best treatise on venereal diseases in the English language, and we congratulate the authors upon their brilliant additions to American medical literature.—*Amer. Journ Med. Sci.*, January, 1880.

LEISHMAN'S MIDWIFERY—New Edition—Just Ready.

A SYSTEM OF MIDWIFERY: including the Diseases of Pregnancy and the Puerperal State. By WILLIAM LEISHMAN, M.D., Regius Professor of Midwifery in the University of Glasgow, etc. Third American edition, revised by the author, with additions by JOHN S. PARRY, M.D, Obstetrician to the Philadelphia Hospital. In one large and very handsome 8vo. volume of 733 pages, with over 200 illustrations; cloth, $4 50; leather, $5 50.

This new edition has evidently been carefully revised by its author and will be welcomed by those who are trying to keep posted in the rapid advances which are being made in the study of obstetrics.—*Boston Med. and Surg. Journ*, Nov. 29, 1879.

This work and that of Playfair now stand first in the estimation of the profession of this country.—*Ohio Med. Recorder*, January, 1880.

PLAYFAIR'S MIDWIFERY—New Edition—Just Ready.

A TREATISE ON THE SCIENCE AND PRACTICE OF MIDWIFERY. By W. S. PLAYFAIR, M.D, F.R.C.P., Professor of Obstetric Medicine in King's College, etc. Third American edition, revised by the author. Edited, with additions, by ROBERT P. HARRIS, M.D. In one handsome octavo volume of about 700 pages, with nearly 200 illustrations. Cloth, $4; leather, $5.

EXTRACT FROM THE AUTHOR'S PREFACE.

The second American edition of my work on Midwifery being exhausted before the corresponding English edition, I cannot better show my appreciation of the kind reception my book has received in the United States than by acceding to the publisher's request that I should myself undertake the issue of a third edition. As little more than a year has elapsed since the second edition was issued, there are naturally not many changes to make, but I have, nevertheless, subjected the entire work to careful revision, and introduced into it a notice of most of the more important recent additions to obstetric science. To the operation of gastro-elytrotomy—formerly described along with the Cæsarean section—I have now devoted a separate chapter. The editor of the second American edition, Dr. Harris, enriched it with many valuable notes, of which, it will be observed, I have freely availed myself.

BRISTOWE'S PRACTICE—New Edition—Just Ready.

A TREATISE ON THE THEORY AND PRACTICE OF MEDICINE. By JOHN SYER BRISTOWE, M.D., F.R C.P., Physician and Joint Lecturer on Medicine, St. Thomas's Hospital. Second American, from the second English edition. Edited, with additions, by JAMES H. HUTCHINSON, M.D., Physician to the Pennsylvania Hospital. In one large and handsome octavo volume of nearly 1100 closely printed pages; cloth, $5 00; leather, $6 00.

Dr. Bristowe, as a practitioner and teacher of medicine, has a very extensive experience, and has brought his learning to bear in the preparation of his book. It is not, therefore, by any means, a mere compilation; but while the author has availed himself of the researches of others, he has epitomized very largely his own personal clinical and pathological observations. As he states, there are few even of the incidental remarks and statements which are scattered throughout the pages that have not originated in, or been sanctioned by, independent thought and observation. Consisting of a single volume, the work is well adapted for students and for practitioners as a work of reference. While it is concise, it is sufficiently full for all practical purposes. It contains a very complete epitome of all that characterize the various diseases and their treatment. We feel confident that the work will continue to maintain its popularity with students and physicians.—*Cincinnati Med. News*, December, 1879.

FLINT'S CLINICAL MEDICINE—Just Ready.

CLINICAL MEDICINE: A Systematic Treatise on the Diagnosis and Treatment of Diseases. Designed for Students and Practitioners of Medicine. By AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine and of Clinical Medicine in Bellevue Medical College, N. Y. In one large and handsome octavo volume of 795 pages; cloth, $4 50.

There is every reason to believe that this book will be well received. The active practitioner is frequently in need of some work that will enable him to obtain information in the diagnosis and treatment of cases with comparatively little labor. Dr. Flint has the faculty of expressing himself clearly, and at the same time so concisely as to enable the searcher to traverse the entire ground of his search, and at the same time obtain all that is essential, without plodding through an interminable space.—*N. Y. Med. Jour.*, Nov. 1879.

HENRY C. LEA—Philadelphia.

NOTICE TO SUBSCRIBERS.

INCREASED INDUCEMENTS FOR 1880.

With a view of increasing the attractions of the "American Journal of the Medical Sciences," and of bringing within the reach of all members of the profession the immense amount of information now presented by it and its accessory periodicals, the "Medical News and Library" and the "Monthly Abstract," the two latter will hereafter be merged together, under the name of "The Medical News and Abstract," commencing January 1, 1880. The "News and Abstract" will consist of sixty-fou pages per month, handsomely printed, in a neat cover, and will contain all the materi heretofore presented in both periodicals, with the exception of the sixteen pages of th "Library Department." Its price will be Two Dollars and a Half per annum, invariably in advance, at which rate subscribers will receive nearly *eight hundred large octav pages per annum*, free of postage.

Not only will this monthly thus be in itself one of the cheapest periodicals offered t the profession, but it will be furnished in commutation, without charge, to advance-paying subscribers of the "American Journal of the Medical Sciences," the subscription t which will remain, as heretofore, Five Dollars per annum. For this very moderat sum, therefore, subscribers will receive two periodicals of the highest class, a Quarterly and a Monthly, containing in all nearly two thousand pages per annum, stored with th choicest original and selected matter that can be furnished by the medical literature o both hemispheres.

These terms may be recapitulated as follows:—

TERMS FOR 1880.

The American Journal of the Medical Sciences, published quarterly (1150 pages per annum), and The Medical News and Abstract, published monthly (768 pages per annum),	Five Dolla per annu in advanc

SEPARATE SUBSCRIPTIONS TO

The American Journal of the Medical Sciences, when not paid for in advance.	Five Dolla

The Medical News and Abstract, invariably in advance, Two Dollars and a Half.

*** Advance-paying subscribers can obtain, at the close of the year, cloth covers, gi lettered, for binding the volumes of the Journal (two annually) and the News a Abstract (one annually), free by mail, on remitting ten cents for each cover.

It is evident that only a very considerable increase to the existing subscription li will justify the unexampled terms thus offered, by which the equivalent of three or fo large octavo volumes is furnished, free of postage, for the trifling sum of Five Dolla Gentlemen, therefore, are respectfully requested to lose no time in remitting their su scriptions, to avoid the risk of disappointment from the exhaustion of the editi printed; and it is suggested that they may aid in rendering the enterprise permane by kindly communicating to their friends the very great inducements thus offered.

The safest mode of remittance is by bank check or draft, or postal money order draw to the order of the undersigned. Where these are not accessible, remittances for th "Journal" and "News and Abstract" may be made at the risk of the publisher b forwarding in registered letters. Address

THE
MEDICAL NEWS
AND
ABSTRACT.

A CONSOLIDATION OF THE "MEDICAL NEWS AND LIBRARY" AND THE "MONTHLY ABSTRACT OF MEDICAL SCIENCE."

EDITED BY

I. MINIS HAYS, A.M., M.D.

QUÆ PROSUNT OMNIBUS.

PHILADELPHIA:
HENRY C. LEA'S SON & CO.
1880.

Published Monthly at $2.50 per annum in Advance.
Furnished in conjunction with the Quarterly American Journal of the Medical Sciences (in all nearly 2000 octavo pages) for $5.00 in advance.

Entered according to the Act of Congress, in the year 1880, by Henry C. Lea's Son & Co., in the Office of the Librarian of Congress. All rights reserved.

NEW MEDICAL WORKS.

CORNIL & RANVIER'S PATHOLOGICAL HISTOLOGY—Just Ready.

A MANUAL OF PATHOLOGICAL HISTOLOGY. By V. Cornil Asst. Prof. in the Faculty of Medicine of Paris, and L. Ranvier, Prof. in the College France. Translated, with Notes and Additions, by E. O. Shakespeare, A.M., M.D. Microscopist to the Philada. Hospital, and J. Henry C. Simes, M.D., Lecturer on Histolog in the Univ. of Pa. With 360 Illustrations on Wood. In one large and very handsom octavo volume of nearly 800 pages: leather, $6 50; cloth, $5 50.

The work of Cornil and Ranvier is so well known as a lucid and accurate text-book on it important subject, that no apology is needed in presenting a translation of it to the America profession. It is only necessary to say that the labors of Drs. Shakespeare and Simes have bee by no means confined to the task of rendering the work into English. As it appeared in France in successive portions, between 1868 and 1876, a part of it, at least, was somewhat in arrear of the present state of science, while the diffuseness of other portions rendered condensatio desirable. The Translators have therefore sought to bring the work up to the day, and at th same time to reduce it in size, as far as practicable, without impairing its completeness. The changes will be found throughout the volume, the most extensive being in the sections devote to Sarcoma, Carcinoma, Tuberculosis, the Bloodvessels, the Mammæ, and the Classification Tumors. Corresponding modifications have been made in the very extensive and beautif series of illustrations, and every care has been taken in the typographical execution to rende it one of the most attractive volumes which have issued from the American press.

MORRIS ON SKIN DISEASES—Just Ready.

SKIN DISEASES; INCLUDING THEIR DEFINITION, SYMPTOMS, DIAGNOSIS, PROG NOSIS, MORBID ANATOMY, AND TREATMENT. A Manual for Students and Pract tioners. By Malcolm Morris, Joint Lecturer on Dermatology, St. Mary's Hospit Medical School. In one 12mo. volume of over 300 pages, with illustrations; cloth, $1.7

The book is clearly and concisely written, and the subject is handled in a way calculated to be readily intelligible to students. The type is excellent, the work neatly got up and of convenient size, and th manual ought to be very useful for the purpose fo which it is intended.—*London Lancet*, Jan. 31, '

NETTLESHIP ON THE EYE—Just Ready.

THE STUDENT'S GUIDE TO DISEASES OF THE EYE. By Mr. Nettleship, Ophthalmi Surgeon to St. Thomas's Hospital, London. In one neat royal 12mo. volume of 370 pages with 89 illustrations. Cloth, $2.

The author has succeeded in touching upon about all the points, diseases, operations, diseases of the eye in relation to general diseases, and has prepared a very acceptable book.—*Cincinnati Lancet an Clinic*, Feb. 7, 1880.

DUNCAN ON WOMEN—Just Ready.

CLINICAL LECTURES ON THE DISEASES OF WOMEN. Delivered in St. Bartholomew Hospital. By J. Matthews Duncan, M.D., LL.D., F.R.S.E., etc. In one very ne octavo volume of 175 pages. Cloth, $1 50.

We have read this book with a great deal of pleasure. It is full of good things. The hints on pathology and treatment scattered through the book are sound, trustworthy, and of great value. A healthy scepticism, a large experience, and a clear judgment are everywhere manifest. Instead of bristling wit advice of doubtful value and unsound character, th book is in every respect a safe guide.—*The Lon Lancet*, Jan. 24, 1880.

FOSTER'S PHYSIOLOGY.—In Press.

A TEXT-BOOK OF PHYSIOLOGY. By Michael Foster, M.A., M.D., F.R.S., Prof. Physiology in Cambridge Univ., England. A new American, from the third English tion. Edited, with additions, by Edward T. Reichert, M.D., Demonstrator of Exp mental Therapeutics in Univ. of Penna. In one handsome royal 12mo. volume, with 250 illustrations.

The matter is very well arranged, and the style is perspicuous and at the same time concise. It deservedly claims a high place among works on physiology, and it will be found to be a valuable addition to the literature of this most important subject.—*Canadian Journ. of Med. Science*, Feb. 1880.

The author of this book is too well known to physiologists to require an introduction. His contributions to this branch of science have secured for him lasting fame. As an advanced thinker and writer his views and teaching are regarded as the highest authority, and may be accepted as the latest outcome of physiological research and study.—*Maryland Med Journal*, Feb. 1880.

On the whole, the book can be called the stand work in the English language, while it has none perior in any other tongue. It is, perhaps, the o work in our language which represents physiol fully as an experimental science. Its completen is admirable. The anxious student can find not o the actual facts of the science, but also the mod which they were obtained. Modern bibliograph references are given very fully, while the sou of older quotations are sufficiently indicated. author proves to the student not only a compi but also a judicious critic.—*Journal of Ner and Mental Disease*, Jan. 1880.

GREENE'S MEDICAL CHEMISTRY.

A MANUAL OF MEDICAL CHEMISTRY, for the Use of Students, based upon Bowma Medical Chemistry. By William H. Greene, M.D., Demonstrator of Chemistry Med. Dept. University of Penna. In one royal 12mo. volume of about 400 pages. W illustrations.

HENRY C. LEA'S SON & CO.—Philadelphia.

Clinical Lectures.

THE TRUE AND FALSE PALSIES OF HYSTERIA.

BY S. WEIR MITCHELL, M.D., OF PHILADELPHIA,
MEMBER OF THE NATIONAL ACADEMY OF SCIENCES.

(*Concluded from page* 71.)

THE form of hysterical disorders with which I propose to begin this brief lesson on the false palsies of hysteria, is one which I do not find any where described. It is the motor ataxia of hysteria. In the great study of hysteria which Briquet made, you will find that he speaks of a locomotor ataxia in hysteria; but he is careful to assign as its cause the loss of sensation extending to joint and muscle.

While clearly recognizing this as a cause of disordered movement, I am sure that it does not cover all the forms of motor ataxia to be met with in hysteria, and which may exist without any necessary relation to paralysis as their cause. The trouble I am about to speak of I find to be very common in hysteria—to coexist with many hysteric palsies or paretic states, and sometimes, though rarely, to be the prominent malady, with almost no loss of voluntary power.

The hysterical ataxic patient of this class, and I shall consider first the nearly pure case, has full feeling, or may have it, and is quite well able to use the limbs more or less freely while lying down. When she begins to sit up or kneel or stand the lack of co-ordinate muscular movements becomes at once visible.

Instantly the patient begins to fall to one side, a voluntary effort to redress the disturbed balance results in a partial fall to the other side or back or forward, as may chance. The patient *seems* to be unable to judge of the extent to which the balance is lost, and also to determine the amount of power needed to overcome the defect. The abruptness of these efforts at redressal of equilibrium appears to show an absence or defect of the usual antagonistic activity of opponent muscles. I am inclined to think that perhaps a large share of this difficulty may be due to a slowness in volitional acts by reason of which the mandate reaches the muscle too late to be of ready service. This is by no means unlikely, for in many hystero-pareses I have measured and proved the retardation of nerve conduction. Slowness in learning the need to move a muscle and slowness in moving it would give rise to just such inco-ordinate action, as these cases exhibit. The lack of orderly movement is chiefly in the neck and trunk less in the legs, and least in the arms. There is a variety of disturbed motion which at first sight looks precisely like this, but is different. In it the patient, although having marked paresis, and as in one case now under my care, distinct hemiplegia and hemianæsthesia when seated and held up, or even when the head alone is unsustained, shows the following symptoms: The head or body is pulled to one side. At the limit of this motion, or before that is reached, it is violently jerked over by the opponent muscles, as if their stretching were the signal for an explosive act of power At once or in a moment the other muscles act in like fashion, and so the head or trunk is thrown about in a strange or disorderly manner so long as the patient remains upright. The same type of movement extends to the legs and arms. These acts are certainly of volitional birth, but they are so to speak convulsive renderings of natural acts, and are sometimes very violent.

In place of giving you types of motor ataxia with palsy I shall prefer to choose one now in my care, and which has the least share of palsy for the largest share of inco-ordination of the muscles.

Miss B., æt. 20, Kentucky, of healthy, living parents, in August, 1876 while going home from the Centennial Exhibition, caught a slight cold, out of which came complete loss of voice for seventeen months. In its return it came and went abruptly, and was well to-day and gone to-morrow. In September, 1871, at the Hot Springs, Arkansas, after a good deal of worry she is said to have had headache and dizziness, after which of a sudden she lost speech, and became unconscious, with her jaws firmly locked. The leg and arms moved in spasm, and when better had lost touch-sense, and did not feel pin pricks. This attack ended in weakness and fever, with cold feet and loss of power to swallow even saliva. After three weeks she regained speech, and then again relapsed. She was said to have had a typhoid fever, which does not seem likely.

About the fifth week she was found to have lost power in the legs The loss is described as having been nearly entire, but by March, 1879 she had gained a good deal of motion. Since then she has been at a standstill.

In October I saw Miss B. in bed, a dark-skinned, rosy-looking girl without the least turn to tears or undue emotion. I should only have said that her manner was quick and excitable. She certainly had none of the usual furtive look, and small deceitfulnesses of a hysterical girl Neither was there loss of tendon (patellar) reflex, and the sense of pain and touch and of heat was perfect.

While in bed Miss B. moved all her limbs somewhat slowly, but with a good deal of power; the lift of the leg was done in jerks as by distinct orders of will, but she showed none of the tremor and twitching of face and tearful look so common in hysteric girls called on for an unusual effort. When held up on her knees, she swayed to and fro, always falling if not assisted. When somewhat later she could stand up, the motor disorder showed still better. From head to foot every muscle used to preserve the upright posture was giving way momently and braced again by distinct acts of will. The rocking motion so caused was curious to see. A slight push was sure to upset her, as if she was unable to provide in time enough of power to resist the shock and restore the disturbed balance. If I warned her of the coming shock, she did far better. The touch of a hand greatly aided her, and the closure of her eyes made things worse. Nor did Miss B., when standing, seem to have the least idea of her balance being in danger until the sway of her figure became extreme, when she caught herself up and with an effort regained her erect position only to fall to the other side. There seemed to be a lack of appreciation of the failing balance, and a slowness in re-dressing it when lost or in peril. When added to this we have complete loss of feeling, when skin, bone, joint, and muscle share alike in this respect, we have, of course, a still more complete want of power to preserve the upright posture, but this is the form of the trouble spoken of by Briquet and others, and I wished to make it clear that there were causes of motor ataxy which did not of need involve any lack of tactile sense. If in examples like Miss B. there be any loss of sensation, it must be that of the muscles—and of these alone; but, as I have shown, this need hardly be called upon in explanation, and tardiness of transmission of nerve messages may be enough to account for all that we see.

In Miss B.'s case little was needed beyond training the weak and inapt muscles, because she ate and digested well, slept soundly, and was free from pain.

My first step was to point out to her that, after she had made an effort which seemed extreme, another forth-putting of will would add to the previous result. This seems a simple thing to make clear; but, if you can convince your patient of the fact, it is of great service, because then you go on to point out further that, perhaps, by a series of trained and aided efforts, there may be won, bit by bit, a full power of motion. To lodge this idea in a woman's mind is at once to widen the horizon of hope. How much you gain by it depends a little on whether your patient is clever and wants to get well, or is silly and prefers the role of hysteria; but, after all, the whole mode of treatment rests on a study of character, or of character and hysteria, and a moral diagnosis is the first step to take.

With Miss B., at a standstill for months—bright, clever, longing for active life—the idea was as a wholesome ferment. The nurse now began to train her while in bed to move the legs, one at a time, very slowly, but in larger and larger movements, with intervals between of a minute or more.

An order is given to lift the leg; if it be too weak, a finger beneath the ankle aids it, but no attempt must be let to fail utterly; as she gets on, the orders are to be obeyed more quickly. It is easy to sketch out for one's self what such a system should be in its details. When it has gone far enough, the patient is seated in bed with some support to her spine, and is trained to move the head freely. When, in Miss B.'s case, she was put on the edge of the bed seated, the motor ataxia began to show, so that it took some time to overcome this trouble. The next step used with me to be the walk in some form, but of late I find it better to teach the girl to creep, which is an easy and natural mode of training for the walk. The patient has pads tied over her knees, and, lying flat on her face on the floor, without skirts, has around her a folded sheet. At an order, she tries to rise, helped by the lift of the sheet-belt held by the nurse. When she is able to do this, and can gather her legs and arms so as to make of herself a quadruped, she is taught to balance herself, every effort being assisted, when needing help, by the nurse standing above her. The progress to creeping is easy; then comes the lesson of kneeling and pushing a chair; and last that of standing in a corner or by a chair. You see that, following nature's lessons with docile mind, we have treated the woman as nature treats an infant. For aid in walking we have three devices: the expensive wheel crutch, which can be easily imitated by a clever carpenter, being merely a framework with rollers so arranged that it includes crutch supports. Next, if need be, I use a device which may be common, for all I know, but which I have not seen elsewhere. It is a pair of crutches with a stout half hoop of metal between and in front of the two. This gives a solid support, and, in ataxic cases, is very useful as giving a sense of being secure, and therefore confidence. This crutch frame is soon replaced by a pair of supports, the base of which is about seven or eight inches long and two broad. It may be made like the lower half of a crutch, or have two columns of support set in the base, or it may be a single cane with a broad base; the top in any case should have a slight slope so as to lie easily in the line of the natural slope of the palm when resting on such a support. A rubber footing gives a little elasticity and a good hold on any form of flooring. With such a broad base of support, it is quite pleasant to find how soon the patient learns with its aid to balance herself. A third form of support which I devised two or three years ago is of use in hysteric or in any form of hemiplegia. If the left side be too feeble for the left arm to aid the left leg by a crutch, I resort to this arrangement. On the lame side a crutch having above a deep hollow to receive the armpit is fastened to the arm by two straps or a glove into which the hand is slipped. From the crutch a metal bar curves forward and towards the sound side, and ends in a handle which is grasped by the sound hand and carried forward by it.[1] I have found these supports most useful in many forms of weakness. In making them or having them made, pray remember that they be made light; most crutches are too heavy.

With regard to Miss B., I may add that she was cured in two months so as to walk unhelped anywhere, and that she is now free from pain and nervousness.

There yet remains to us hysteric paresis. Among the many disorders which hysteria affords, certain ones come clearly out from the tangle of named or nameless symptoms, and enable us to speak of them under some distinct name. It is a comfort, amidst so much that is confusing, to find these groupings of symptoms, and, in diseases of vague boundaries like neurasthenia and hysteria, a good deal of this useful sort of secondary classification is possible.

The history of hysteria is sometimes one of years, and in certain cases, either at the outset or after more or less of the strange drama of this disease has been played, the patient falls into a state of inertness of mind and body, which I am forced for lack of a better name to call hysteric paresis. It may be seen in union with other signs which are more clearly hysterical; but sometimes we find it almost pure from these disguises, as in the case of Miss L., from New Jersey, now in the Infirmary. A person of languid nature, not strong in mind or body, she began some years ago to be emotional, to have loss of appetite, weakness, tender spine, vertex headaches, etc. By and by she took to bed, and with more and more complaint of her back, and soon of soreness everywhere; ate less and less, gave no care to her bowels, and at last became feeble, sallow, wasted to the limit of wasting, and content to lie still most of the time, using mind and body as little as she could. From this state I rescued her and made her well, and now she is here again far worse than ever, unable to lift a limb or to turn over. She is twenty-two years old, and has not menstruated in six months. She is five feet five inches, and may weigh about eighty-eight pounds. Her skin is rough, dry, unpliant, yellowish, and seems to be firmly glued to the bones and muscles beneath it. Her morning temperature does not exceed 97.5° F.; her heart beats 90 to 120, and is quick and feeble. The organs seem healthy, and the secretions normal. She cries at times, but not much. Her face, marked with acne, is set, inert, wooden, as if she could not smile. The lids droop, the mouth hangs a little open, the voice is so feeble that it is hard to know what she says. The spine is very tender, and to touch it brings a gush of tears; but the left iliac fossa and the chest muscles are also tender. Her dislike to make any effort was great, but it was clear that no motion was lost, although all were wonderfully feeble. There was not during movement the jerky action of hystero-palsies, but an extreme and evident difficulty in motion, and a sudden failure to prolong it.

---

[1] All of these supports are made by Kolbé & Son, 1207 Arch Street.

All the battery of toning influences was turned on this woman, and she is now gaining ground apace. She is fed often and in small amount, had for a time rectal feeding also—and the mechanical tonics, massage, and electricity. As usual in all such cases, we wait until the flesh is coming back, the colour brightens, and the muscles grow firmer under our mechanical stimulations before we call upon her to exert herself. Then, in this order, with passive motion—motion aided by a nurse, motion resisted by a nurse, active motion, unhelped—we shall train her back to a state of health. We shall cure her surely, but whether or not she will remain well I cannot say. It will depend on what kind of influences surround her, on what she is when well.

I have given here a short sketch of a state of paresis, in which with some anæmia or without a very marked condition of lack of blood all the functions are enfeebled, and this is most notable in those which involve muscular exertion of any kind. If there be also any pain such as that of spinal irritation made worse by motion, the patient is even more apt to be sluggish, and is not slow to avail herself of this and of every excuse to keep as quiet as possible. The real and singular want of power, as well to begin as to continue a motion, seems to set this apart from cases of mere neurasthenia while the general wasting and appearance of mal-nutrition serve yet more deeply to mark the distinction. The disorder I have described so briefly is one of those which adds many recruits to that large class which some one has called "bed cases," and which are above all things distinguished by their desire to remain at rest.

We have dealt so far with cases in which there was from some cause a real lack of power. We may share the common medical belief that some of them are within the chance of abrupt help by causes like the emotions which first gave rise to them, but for the most part they are not to be looked upon as of easy relief in this or in any way; in some members of the class of false palsies to which I shall now refer it is often possible to obtain ready and even sudden cures, and among them occur the cases which afford material for the skill of the so-called magnetizers, or for the modern miracle.

Russell Reynolds has described in a very able paper a number of cases in which some form of disorder appeared to have been brought about by dwelling upon a case of disease, the fixed idea being associated with some emotion. Now it has seemed to me that there is a state of mind and body, not rare in hysteria, in which there exists a so monstrous development of this strange power to create disorder by thinking of it that even a slight hint as it were will suffice to evoke a novel symptom. In this disease indeed we find women and men too passing into a mental state in which they are really much like people in dreams. Their power to reason on the phenomena of the senses leaves them, and what they conceive to be the case takes the place of that which is. These are they who are hurt by light or believe they are, who cannot bear noise or think they cannot, who feel vibrations as pain, who live muffled lives in dark rooms, and believe they cannot walk or even lift a hand or move the head. Such cases are looked upon as simulation of disease by some writers, and are I am sure prone to pass into that evil stage of hysteria, but others there are I also know who live lives of odd inhibition—slaves to the tyrant ideas which they themselves create.

This of course is to be met with to some extent in all grave hysteric cases, but it is also as I have said the ruling feature of a few. If you cause such hysteric women as these to believe that you can cure them you enlist on your side their own troops, for as you can create symptoms so can you also create absence of symptoms. There is in all this something like the so-called magnetizing of which we used to hear and see so much. Under a fixed belief people were made unable to move, or could not close the eyes, or could not open them, or were made to seem to have a pain by touching a point on the body. The patients I speak of are all very subject to like delusions. You put a finger firmly on the spine and ask if the patient have not now a pain in the left breast. She says no. You persist. At last she says yes—"Oh, yes, it hurts me!" Now, is this pure sham, or is it not? Does the presence of the set belief create pain? Is this like the pain of dreams, which seems real enough while we are in the state of dreaming? I have thought over all this a great deal. When we put a finger on the eye unopened for days and say now you can open it, and this is done, or when we arrest motion by an order we see a plain physical result which must have behind it a mental state out of which it grows, and so it seems to me that looking at the pain evoked by ideas or beliefs in the light we get from the motor phenomena, so evolved, we are hardly wise to stamp these pains as non-existent.

At the same time that I put forward this doubt as to the justice of the common view I am far from thinking that the hysteric girl of the class I am now discussing suffers as sharply as she seems to do, the emotions are no more in control than in a dream, and no pains are little, no burdens light. And now how to deal with these cases. Be sure you study them well before you act, because a first failure is apt to be fatal to success.

I have now in my care Miss C. from Chicago. When I first saw her she was in bed, which she quit but rarely and with difficulty. The room was kept dark, and she wore blue glasses over the closed eyes, and outside of all a bandage. She used cotton in her ears, and her nurse and parents crept about the room in list slippers. She had in all ten pillows, large and small, as supports around her, and was, as a young hysterical girl once told me "crowded with symptoms."

The character of this girl had always been that of a person thoughtful of and for herself, and not free from esteem for her own mental powers, so that she had been able and also very willing by degrees to rule a meek household with that reckless despotism the throne of which is very often the couch of an invalid.

This case seemed to me one in which set beliefs, easily gotten and well nursed, had attained a power which gave rise to pain and over-sensitiveness and more or less inhibited movement. I began to deal with it by learning all I could from the girl herself to add to what I already knew of her mind, her morals, her habits, tastes, friends, education, and home life. Then the talk was let to settle on her eyes, and at last on the uses of light and the fact that its excess hurts even the healthy, but does not injure them. When at last she grew interested, and with herself for a text, that was easy, I said, perhaps a woman of strong character might learn to bear the light after long disuse of her eyes; that such a one could not get well readily in the dark, and that although the light would pain her, it most surely could not cause disease. I then left her with the idea that she would in a few days conquer her rebel eyes, and that it was absurd for a woman of intellect to let one organ disorder the whole body. The next day I found her with open eyes and sunlight in the room. One by one the ideas on which the case was built were thus artfully routed, and she is now after but a few days of treatment far on the road to health.

These victories are less easy with older women; but even then the mode of dealing with them is as much a question of the basis of character as of anything else. Sometimes we only need to dispel one symptom to overcome all; sometimes the return to health and healthy ideas exacts a long and tiresome struggle. Sometimes it is safe to assure the patient at the outset that they have but to believe and exert themselves in order to walk.

In this Infirmary, I saw some years ago an abrupt success obtained in this latter way in a woman fifteen years in bed, who was made able to walk well in three weeks, and I could easily add, were it needed, the details of many other and less striking cases. I had meant to say something here of that form of hysteria in which the patient deliberately acts a part, and with more or less cunning deceives those about her. I have seen a goodly number of these cases, but among them I have found quite rare the attempt to simulate palsy. It is easy enough to learn when a woman is pretending to pass calculi or vomit snake bones, but to know if her loss of power be real, or if she be suffering from an inhibitory idea or belief is more difficult. I may say, however, that purely simulated palsies in hysterical girls lack the qualities of hystero-palsies, are too complete, and show no loss of feeling. The best cases I can recall were in very young girls, and were present with much mental disturbance and after a long role of hysteric symptoms had been played with success. But already this lecture has reached a length quite too great, and I must put off to another time what I shall yet have to say on this interesting subject.

One subject which I have not ventured upon is that of diagnosis, nor can I linger upon it. I see every now and then, quite often in fact, cases of hystero-palsies which are sent to me as organic spinal diseases, while it is very rare to observe the opposite error. I think that these mistakes arise largely from mere want of accuracy in applying the diagnostic tests, and especially the electrical tests to be found in detail in all the great text-books. Next to this in importance is a failure to look sharply into the character of the early and præ-paralytic symptoms and the apparent causes of the disease.

I have said little as to the use of drugs in the treatment of the various forms of hysteric palsies or pseudo-palsies. I have said little because I believe that the numberless remedies for hysteria to be found in the books will be swept by another generation into the limbo provided for drugs with decayed reputations. I have no belief in the direct cure of hysteric losses of power by any drugs yet known to us; but in thus expressing myself I do not mean to say that no drugs have an indirect value. What you have to do is to rectify with care positive uterine troubles, to treat the anæmia so apt to exist in hysteria, to see that every function is well cared for, and, last not least, in ways I have pointed out, to learn what need there is to alter the moral surroundings of your patient, and then with kind and patient care, and an unbending will, to bring about the changes she may seem to require.

Do what you will—many of the cases I have so hastily sketched cannot be cured at home—isolate them, give them a new and well-trained nurse, take away, above all, the unwholesome round of home-petting or sympathy, deprive them of slaves made willing by unthinking love, and you may count on promptly curing many a case which you will utterly fail to aid under less hopeful circumstances.

CLINICAL LECTURE ILLUSTRATING ANTISEPTIC SURGERY.

Delivered in King's College Hospital.

By JOSEPH LISTER, F.R.S.,
Professor of Clinical Surgery in King's College.

Gentlemen: Here is a case which I wish to dress before you to-day—that of the woman from whose back I removed a large recurrent fibroid tumour twelve days ago. This tumour had first shown itself fifteen years since. It had been removed and recurred, removed again and recurred at intervals of three or four years, the woman each time foolishly allowing it to grow to large size before she sought the surgeon's aid. On the occasion of its fourth removal it was found adherent to the spinous processes of some of the dorsal vertebræ, which were accordingly scraped by the surgeon who performed the operation. When the patient again applied to him, with a large tumour in the same situation, he recommended her to my care. Finding the tumour of firm consistence, well defined, and freely movable, except about its middle, where it lay over the spine, and considering its very chronic course, I thought it right to give the poor woman another chance, and accordingly I removed the large mass, taking with it the skin that lay over the growth, about five inches in breadth, and all the scar of the previous operations, the incision being about a foot in length. Finding the tumour firmly adherent to the spinous processes of four of the dorsal vertebræ, I removed those processes in almost their entire length with cutting pliers, and also a considerable mass of spinal muscles in their vicinity, leaving a large hollow in the middle of the back. I was desirous that this deficiency should be closed in immediately if possible, and accordingly, by a plastic operation, I brought a large flap of skin inwards from the right side of the back, to cover it.

In adjusting the flap in its new position, I found great advantage in the use of the button-stitches of relaxation. I have for some time past used the lead buttons with a modification of form which makes them better for their purpose.

The plate is cut in the shape represented at A (Fig. 1), having two wings, which are turned up so as to be at an angle of about 45° with the rest of the plate; and round these wings the end of the wire is wound after passing through the central perforation, as shown at B (Fig. 2). This is more readily done and undone than the winding of the wire round the plate as formerly, and at the same time the presence of the wire on the under surface of the plate is avoided, which by its pressure sometimes gave rise to a linear sore.[1] The buttons are represented in position in the accompanying wood-cut (Fig. 3), where the coarse dotted lines, C D E, C F E, represent the incisions made for removal of the tumour, the coarse dotted line, G H I, the incision which limited the flap of skin raised in the plastic operation, and the continuous lines show the ultimate arrangement after the flap was stitched in place, while the fine dotted lines indicate the subcutaneous parts of the silver wires connecting the several pairs of lead buttons.

Fig. 1.

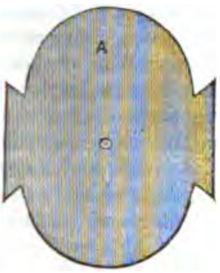

Fig. 2.

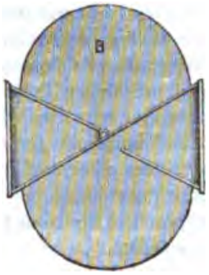

Fig. 3.

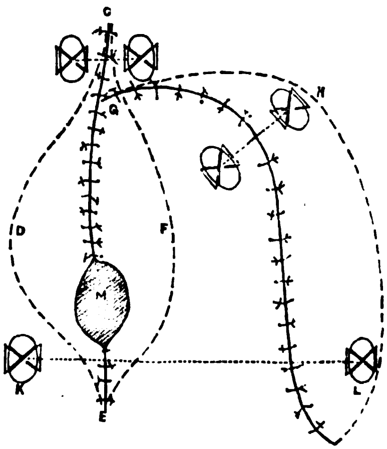

I wish to direct special attention to the manner in which the lowest pairs of buttons, K L, are arranged, as I have found it very valuable in operations of this kind. While it is desirable, with a view to primary union, that the cutaneous margins should be everywhere approximated, it is of vital importance that the base of the flap, on which the supply of blood is in the first instance entirely dependent, should be protected from undue tension, or from pressure or traction by button or wire. With these objects in view the needle carrying the silver wire which was to connect the buttons was passed through the skin on the right-hand side considerably distant from the edge of the wound, and, being brought out at the wound, was entered again beneath the skin at the left-hand edge, and made to emerge at a distance from the wound corresponding with that on the right side. The wire passed in this way did not engage the flap at all, but simply lay beneath it across the raw surface of the wound; and thus when the buttons K and L were pressed home and secured, the result was that while the flap was left entirely unaffected, the edges of the skin at each side of it were, thanks to the yielding of the integument of the trunk, so much approximated that they could be stitched closely to the edges of the flap without undue tension. The sutures employed were of pretty thick silver wire, with here and there intermediate stitches of carbolized silk or purified horsehair for accurate coaptation. Intervals were left at G and M for the orifices of caoutchouc drainage-tubes. Relaxation of the skin of the back was also provided for by having part of the bandage which fixed the gauze dressing disposed in figure-of-8 fashion about the shoulders so as to keep them drawn backwards.

---

[1] It is perhaps well that I should mention that this modification of the buttons was introduced before the publication of that suggested by Dr. O. Will, of Aberdeen, for a similar purpose (see *Brit. Med. Journ.*, June 21, 1879). The form described in the text will, I believe, be found at least as convenient as Dr. Will's, while it is more readily made, either by punching a lead plate, or cutting into the requisite shape with scissors.

It so happened that the patient had reactionary bleeding that afternoon, a very rare thing indeed with us, such as we do not generally see from year's end to year's end, but it did occur in this instance, probably from some muscular branch, and before the dressing was changed the patient had lost a good deal of blood. Tossing about in restlessness she moved her shoulders very much, and by these movements tore out some of the stitches. In this way there was produced a gap towards the base of our flap, a circular opening about two inches in diameter (represented at M in the wood-cut) exposing the interior of the hollow wound. I wish you to see the appearances at this stage of the case. I hold my hand over the part of the dressing corresponding to the wound, while the bandages are being cut and the edge of the dressing raised, and only take away my hand when the spray has got fairly under the edge of the dressing, and is over the region of the wound. The wound is now exposed before you, and you see the circular window leading into the interior. We used to say before the introduction of the antiseptic treatment that, if a wound did not unite by first intention, suppuration was established in about four days in the adult in cool weather, and in about three days in a child in warm weather. Here twelve days have elapsed since the operation. Union by first intention was impossible throughout a large extent of this wound, not only on account of the gaping opening of the skin, but also because the under surface of the flap which was drawn over the hollow in the back was not in contact with the floor of the cavity. Yet observe we have no suppuration. I wish some of our friends who doubt whether the antiseptic treatment has any influence for good could see a fact of this kind. Twelve days with a great hollow wound like this, with an opening leading freely into it, and the tissues exposed, and yet not a drop of pus! Now, as I did not hesitate to say that the result which you witnessed in the case of empyema (see *Medical News and Abstract*, Feb. 1880, p. 72) could not have been obtained without antiseptic treatment, so I venture with equal confidence to affirm that the merely serous discharge which you see upon this dressing could not have occurred without antiseptic treatment of some kind; not necessarily the kind of antiseptic treatment we use, but something really effectually answering the purpose of keeping putrefaction out. That the dressing here used has been thus effectual allow me to give you evidence. That dressing has been on the patient two days; you see the oiled silk "protective" perfectly free from the dark discolouration which it would acquire within such a period if putrefaction occurred, and you can ascertain for yourselves as I pass it round that it has no odour of putrefaction. The dressing, then, has been truly antiseptic; it has, as a matter of fact, prevented putrefaction. Observe now the entire absence of inflammation about this wound.

It has been so from the first. There is no inflammatory blush whatever, nor has there been from first to last. The day after the operation we saw that the upper part of this flap for about two inches in breadth presented a livid discolouration; looked as it were about to lose its vitality. I remarked to those of you who were present in the ward, that it did not follow that there would be any death of tissue, although I believe any practical surgeon who had seen the case then would have said that under ordinary treatment there must have been an extensive slough. I said I did not at all despair of this part, to a large extent at least, recovering itself; because, even supposing any portion of tissue has lost its vitality through defective circulation, and suppose that piece of tissue so dead does not putrefy, it does no harm to its neighbours from the mere fact of its being dead, any more than the dead intestinal tissue of the catgut with which we tie our arteries. Catgut is absorbed by the living tissues round about, and so may other dead tissues be absorbed and not in the least offend their living neighbours; whereas, on the other hand, if it does putrefy, the dead piece, being putrescent, becomes a source not only of irritation, but of caustic action to the parts immediately adjacent. For if one portion of tissue has lost its vitality through interference with the circulation, you may be quite sure in the immediate vicinity other parts will be weakened in their vital power from the same cause, just as in the case of senile gangrene, where we know the liability of gangrenous inflammation to spread. But here you see that the once livid patch has to a large extent recovered itself. It remained discoloured for several days, but we found on firm pressure with the tip of the finger that the colour could be dispelled, and it slowly reappeared when the pressure was removed, showing that the blood was still fluid in the vessels, whereas, if the tissues had been dead, the blood would have been coagulated. There now remains only a little piece of the extreme margin of the flap, an inch and a half long and about half an inch broad, which is not obviously alive. This little bit has actually lost its vitality, but here it remains after these twelve days still firmly attached to neighbouring parts, the stitches which connect it with the living skin still holding. It has induced no suppuration, nor excited the faintest inflammatory blush in the surrounding skin. There is not even an absolutely defined line of demarcation. That, again, gentlemen, would have been an impossibility without effective antiseptic treatment. But with such treatment it is a possibility, for I have seen it in larger sloughs than this, that this piece of dead tissue may be absorbed and never separate at all.

One other point about this wound is worthy of your attention. This window, that we see leading into the cavity, was at one time considerably bigger than it is now. It became encrusted at its borders by exuding liquor sanguinis, which, coagulating, formed a solid ring within it, and this exudation of liquor sanguinis has gone on, producing a broader and broader ring. The parts first formed, remaining free from putrefaction, have undergone organization, including vascularization, and the newly-formed vessels have continued to pour out plasma. And now, if we turn up the superficial layer of the coagulum at its outer margin, we see disclosed a ring of cicatrix. That is to say, the organization of the ring of coagulum has assumed the character of epidermic formation in the vicinity of the pre-existing epidermis of the cutaneous margin. And this process of cicatrization has been going on without the production of any pus, and even without the formation of any true granulations. I never happened to see anything exactly corresponding before. But this is, doubtless, simply because I never before had the opportunity of studying a window like this in a piece of skin stretched over a cavity. For we have here only a peculiar instance of what we are familiar with under antiseptic treatment, the organization of blood-clot and cicatrization proceeding under the superficial layer of the coagulum without the occurrence of suppuration or true granulation. It is by virtue of the same process of progressive exudation and organization of plasma that the cavity of the wound is being constantly reduced. We see, on looking through the window, that the floor of the cavity is not so far below it as it was; the hollow is becoming constantly shallower. Now, all this, gentlemen, presents what must seem to those who have not witnessed it a marvellous and incredible contrast with the old mode of healing by granulation and suppuration, which must infallibly have occurred without antiseptic treatment.

I now reapply the dressing. The protective, dipped in the 1 to 40 watery solution to destroy the septic property of any dust adhering to it, is applied over the healing wound. Immediately over this is placed a piece of the carbolic gauze, dipped also in the lotion, to insure that it is actively antiseptic when applied, for the dry gauze cannot be trusted in this respect, and over this the regular gauze dressing of ample dimensions. Remember the immense importance of having the protective overlapped well on all sides by the gauze. The protective, having nothing antiseptic in its composition, must be overlapped just as if it were itself a wound.

The bandage is so arranged as to brace the arms somewhat back, though that is not now so necessary as it was in the first instance. Here again, from the liability of the chest to movement, we use the elastic bandage—one piece round the shoulders and another round the waist—to keep the edges of the dressing constantly applied to the skin.

The attainment of the results which you have seen in this case depends not only on the efficacy of the antiseptic measures used, but also upon the use of an efficient protective, as we term it—that is to say, a layer of material employed to protect the healing part from the irritation of the antiseptic itself. And with reference to this point, I may mention that we have now a considerably better protective than we had some time ago. It still consists essentially of oiled silk, varnished on both sides with copal varnish. The copal varnish is the principal agent in this protective for keeping the carbolic acid out; it is much less permeable to carbolic acid than oiled silk is, although oiled silk itself is much less permeable to the acid than gutta-percha or caoutchouc is. The copal varnish, then, is the most important of the ingredients of which this protective is composed. Some time ago one of the manufacturers who supplied this protective, for reasons best known to himself, omitted the use of the copal varnish altogether, and supplied us with what was evidently mere oiled silk varnished with dextrine (which is put on outside the copal to insure that the material shall take an antiseptic film when dipped in carbolic lotion). We were supplied then with mere oiled silk brushed over with dextrine, and this is a comparatively ineffective protective. On the other hand, that which we now use is coated on both sides with specially thick copal varnish, and this makes it correspondingly effective. I understand that some persons object to this protective as being too thick and substantial. These gentlemen little know what a mistake they make in thus objecting to it. When it comes to be of the temperature of the body, it becomes perfectly soft and pliable; it applies itself beautifully to the part, so that there is no objection to it on that score. If we had not used a pretty effectual protective, we should not have had the kind of results you have seen in this case. If we had had a carbolic acid dressing acting directly on the tissues of that exposed wound we should have had before now granulation and suppuration—suppuration occasioned by the irritation of the antiseptic—"antiseptic suppuration," as I have termed it; and if we had had the gauze dressing directly applied to that piece of dead tissue, it would have been impregnated with the pungent antiseptic, and would have become chemically stimulating on the same principle, though in a less degree, as if it had been putrid; it would have stimulated its living neighbours and urged them to granulation and suppuration, and we should have had a piece of dead tissue already separated by antiseptic suppuration.

Again, if we had not used a pretty efficient protective, we should not have seen the blood-clot organized and cicatrizing without suppuration at the edge of the window in the skin. We should have seen it with a granulating and suppurating margin. I am induced to speak on this point because I believe the protective is often as yet imperfectly understood. A very eminent surgeon was round my wards some months ago, and he told me he had never seen the organizing blood-clot. I took him to two cases in which it was occurring. He was a man of scientific precision, and he at once said, "These cases are enough for me; I know from this time that an exposed blood-clot may become organized." How was it he had never seen it, for he had practised antiseptic treatment with great efficiency for years? The truth was, as he told me, he had not thought the carbolic acid particularly irritating, and he had never used any protective at all, and therefore had never seen an organizing blood-clot. I had sent to me some time ago, by a very distinguished Russian surgeon, this beautiful looking article—this transparent film,—which he told me he now always used in preference to our protective—a most lovely thing, certainly enough to charm us to use it by its mere beauty. But I found it would not stand the test which will enable you always to ascertain the quality of a protective. I took a piece of it, and put upon the middle of it a little bit of lint soaked with 1 to 20 carbolic acid lotion, and left it awhile; in the course of about half an hour, on applying the tip of my tongue to the other side, I perceived the pungent sensation caused by carbolic acid, showing that it had already gone through it; whereas, with a piece of this properly made protective, treated in the same way, you would find, after the lapse of three or four hours, absolutely no trace of the acid. Therefore, although this so-called protective is very pretty, it is scarcely a protective at all in the sense in which we use the term. It will keep the wound moist, and thus prevent the dressing from sticking to it, but that is nearly all it will do.

But worse remains to be told of this elegant article. The chemist who sent me the samples informed me that it contained thymol and salicylic acid in its composition; in other words, it was not only inefficient as a protective against the antiseptic, but it was actively antiseptic in its own substance. And he added, it could be made up with carbolic acid; showing that he had no idea whatever of the object for which we use the protective. It has been said sometimes that our dressings irritate wounds. The wound you have just seen is an instance to the contrary. It is not irritated; it is healing kindly, and not only so, but it shows very much less marks of irritation than you could get with any ordinary treatment that has been devised. But if surgeons use the antiseptic agent, whatever it be, in such a way as to act directly on the tissues, they will necessarily have their wounds more or less irritated according to the nature of the antiseptic they employ.

But, useful as a protective is in promoting the best kind of healing under an antiseptic dressing, I desire to say, by way of warning, that it would be infinitely better to use no protective at all than to employ it amiss; for, though at the risk of seeming tedious, I must repeat that in proportion to the efficiency of the protective in excluding the irritation of the antiseptic, is its power to exclude also its antiseptic virtue, and thus to conduct putrefaction inwards to the wound, unless it be overlapped well on every side by the really antiseptic element of the dressing.

[In preparing this lecture for the press I may add that, on examining the wound yesterday (Dec. 9th), I found that the still serous discharge had become so slight that my house-surgeons had allowed four days to pass without changing the dressing. The buttons had been removed several days before, yet the cutaneous margins remained everywhere in contact, except that a gaping of about three-quarters of an inch had occurred at the lower part of the window, M, after the removal of the buttons, K and L, which especially supported that part. But though the window had been from this cause temporarily increased in dimensions, it had since been reduced to less than its former size by the same mode of healing that it had before presented, and, while suppuration was still absent, the border of cicatrix had considerably increased in breadth. The window was occupied by a gray pultaceous mass of lymph, which was the nearest approach to suppuration that had been seen throughout the case. I clipped away about one-eighth of an inch of this gray substance with scissors, when blood oozed from the incision, showing that vascularization had occurred almost to the surface. The process of healing by successive exudation and organization of plasma, which I think has never before been distinctly described, but which this case has so beautifully illustrated, had entirely closed the great cavity of the wound. And the new tissue thus developed having, like new tissues generally, a tendency to shrink as it grew older and more perfect, the skin of the flap covering the cavity—which in the first instance was stretched straight across from scapula to scapula, had been drawn down somewhat into the hollow, so as to present a concave appearance, while the part felt firm and solid under the finger.

At the same time my anticipations of possible absorption of the slough without suppuration had been already partially justified. Whether the slough originally involved the whole thickness of the cutis or not, I have no means of knowing. Certain it is that the stitches which attached the edge of the flap at the site of the slough still retained their hold, and the border of the mass of dead tissue thus kept in contact with the healthy living skin had undergone a process of organization—that is to say, of substitution of living tissue elements for the dead which they absorbed—exactly similar to that which had occurred at the border of the window in the skin. And thus, without the slightest trace of suppuration and without the occurrence of granulation, a cicatrix about one-sixth of an inch in breadth had come to occupy the place of the upper border of the slough.]—*Lancet*, Dec. 20, 1879.

Hospital Notes.

Dislocation of the Upper End of the Radius Backwards.

Albert P——, aged fourteen years, a factory boy, applied to Mr. RIVINGTON at the London Hospital on Oct. 21st. He stated that whilst running he had fallen on his right arm, which was twisted (pronated) at the time, and that the back of the hand and elbow came in contact with the ground. He positively affirmed that prior to the accident there was nothing the matter with his elbow.

On examination a marked prominence was seen at the back of the joint below the external condyle and by the side of the olecranon process, evidently consisting of the displaced head of the radius. Flexion and extension were almost unimpaired; pronation and supination could be performed by the surgeon, but not to the full extent; supination especially was diminished, and the patient could not affect it himself to the same extent as the manipulator; there was no crepitus or other evidence of fracture, the head of the radius rolling freely under the finger during examination; there was a bruise over the head. A persevering attempt to reduce the bone was made under chloroform by Mr. Clark, the house-surgeon, without result. The patient was taken into the house, and later in the day was taken up to the theatre for Mr. Rivington to examine. As the lad adhered to his statement that the displacement had not existed before the accident, chloroform was again administered and extension made in various positions, with pronation, supination, and pressure on the head of the bone, for about ten minutes, but in vain. He was sent to bed, and evaporating lotion was applied. No swelling or increase of heat followed, and on the following Monday he was again examined under chloroform, being seen also by Mr. Hutchinson and Mr. Tay, who noticing some thickening in front of the head, suggested that perhaps a portion of the articular end of the humerus had been detached and prevented reduction. The following day the mother of the boy was interrogated, and it then transpired, as had been suspected, that the displacement was not recent, having occurred at least five months previously in a scuffle which the lad had had with an enraged landlady, during which he was violently shaken by the forearms, and fell striking his right elbow against the leg of a table. He told his mother his arm was broken, and after the subsidence of the ensuing swelling, the lump at the back of the arm was noticed, and it had been there ever since.

Remarks by Mr. RIVINGTON.—There are several points of interest in this case, the chief being the amount of mobility of the joint possessed by the patient before leaving the hospital. He could flex the elbow fully, and extend it almost as completely as on the sound side. Although occasionally rotating the humerus when asked to turn his hand over, he could, when the humerus was confined, pronate well, and supinate to rather more than half the natural extent. The positive assurance of the patient that the displacement had not existed previously led me to speculate on the causes of the impossibility of reduction, and it occurred to me that possibly the head of the radius might have slipped out of the orbicular ligament, instead of tearing it away from the margins of the lesser sigmoid cavity, or that the peculiar shape of the head was the obstacle, having slipped perhaps, through a rent in the ligamentous or aponeurotic structures at the back of the elbow-joint, and become fixed more or less, like the head of a stud in a buttonhole. The notable absence of swelling and increased heat, and the remarkable mobility, so suggestive of an old injury, led me to make further inquiry and prevented me from bringing the case forward as one of recent injury in which reduction could not be effected. The statements of patients are seldom to be implicitly trusted, possibly those of juveniles should be altogether disregarded without confirmatory testimony. The mother and patient have been advised in case of any future bruise to inform the surgeon that the displacement is an old one, and obviate the possibility of any future attempt at reduction. It would be interesting to learn some years hence whether the mobility remains. In the only two dissections known to me, the head of the radius has contracted fresh connections. In the specimen in St. George's Hospital Museum the new attachments formed by the ends of the orbicular ligament with the humerus prevented pronation and supination. It is probable that the articular ends of displaced bones are particularly liable to undergo changes similar to those seen in chronic rheumatic arthritis, and fresh bone sometimes forms in their neighbourhood. Hamilton states that Dr. Markoe believes that this dislocation, which is a rare one, never occurs as an uncomplicated accident. Certainly there was no sufficient evidence of any fracture of either condyle of the humerus or of the articular surface of the humerus in this case, whatever might be the suspicion from the thickening observable. The head of the radius was displaced more directly backwards than is usual according to the descriptions of books, not lying in anywise behind the external condyle, but a little overlapping the articular end of the humerus. It appeared to be placed outside the oblique outer margin of the anconeus muscle.—*Lancet*, Dec. 27, 1879.

Empyema treated by Free Incisions with Antiseptic Precautions.

George H., aged 4; admitted into King's College Hospital, under the care of Dr. PLAYFAIR, Oct. 16, 1879, with albuminuria (one-third); no history of scarlatina, and no lung symptoms. On Oct. 20, slight rigor, temperature running up from 97° to 103.6°, and at about the same date dulness over the left base first noticed. On Oct. 25, dulness more marked; left side measures an inch more than the right; feeble entrance of air over whole left side; heart displaced to the right of median line; temperature zigzag. On Nov. 1, breathing feeble and jerky; 54 per minute; pulse 144 per minute; great distress. Ordinary small trochar and canula introduced below the fifth rib, but no fluid escaped. On Nov. 2, breathing and general distress more marked. Aspirated at 9.30 P. M. about 3 to 4 ozs. of healthy pus, drawn off with immediate relief, temperature dropping from 102.6° to 98.2°, and the breathing from 48 to 36 per minute.

On Nov. 5, as the distress was still very great, and there was every evidence of fluid still remaining in the pleural cavity, it was decided to operate. At 2.30 P. M., Prof. Lister made an incision about one inch long connecting the two previous punctures. The usual antiseptic precautions were observed, and an ordinary drainage-tube introduced. During the operation between 6 to 8 ozs. of sanguineous fluid escaped, and a quantity of fibrous deposit was felt between the two layers of pleura both above and below the opening. Since operation the acute symptoms have gradually subsided, and with the exception of a short rise from the 11th to the 17th, which was probably due to the kidney mischief, the temperature has been comparatively normal. There has been but little discharge from the wound, which is now dressed antiseptically about every fourth day. About fourteen days after the operation a short silver tube with a shield was substituted for the India-rubber drainage-tube, as being less irritating and cleaner. The breath sounds can now (Dec. 22) be heard perfectly all over the left side of the chest: the heart has gradually returned to its proper position; and, in fact, the child may be said to be practically convalescent.

Remarks by Dr. PLAYFAIR.—This case is peculiarly interesting as affording an excellent example of the application of the strict antiseptic method to the treatment of empyema in children. He had long been convinced that the great desideratum in the management of such cases was some plan by which continuous drainage could be obtained without the admission of air into the pleural cavity. In the fourteenth volume of the *Obstetrical Transactions*, in a paper "On the Treatment of Empyema in Children," he had published a series of cases in which he had attempted to do this by a system of continuous sub-aqueous drainage, one end of the drainage-tube being in the pleural cavity, the other in a vessel of water under the bed. The results were on the whole good, but the practical difficulties in the way of carrying out the process were considerable; and, in several of the cases, it was found impossible to prevent the entrance of air by the side of the tube. He had felt convinced that the antiseptic system, which admitted of the pleural cavity being laid freely open, without the risk of the exhausting effects of long-continued purulent discharge, afforded the best hope of a satisfactory result. This case, which was the first in which he had had the opportunity of carrying it out, remarkably corroborated this expectation. In itself it was an unfavourable case, on account of its severity and the co-existence of renal complications. In spite of these drawbacks the result was most satisfactory. From the moment of the operation the child began to improve. There was next to no purulent discharge and the lung rapidly expanded. The fact that the dressings required to be changed only every third or fourth day much simplified the management of the case, and he felt convinced that the antiseptic method afforded a marked advance in the means at our disposal for the treatment of this most severe and troublesome class of disease.—*Obstet. Journ. of Great Britain*, Jan. 15, 1880.

MONTHLY ABSTRACT.

Anatomy and Physiology.

On the Hymen.

Dr. Budin (*Annales de Gynecologie*, Nov. 1879) has made several dissections of the vagina and vulva in virgins, and has found that the hymen is in reality constituted by the anterior extremity of the vaginal canal. The vagina may be regarded as the finger of a glove presenting at its anterior extremity a circular orifice. This circular perforated extremity of the finger of the glove comes forward and insinuates itself between the labia minora, where it juts out and forms what is called the hymen. The dissection showing this has been repeatedly made by Dr. Budin, and always with the same result. When the dissection is carried out completely, he is able to remove the uterus and the whole of the vagina; and with the removal of the vagina, which is easily separated from the surrounding structures, the hymen is found to have completely disappeared.

Absorption by Granulations.

The idea that granulations are good absorbing surfaces is one which few at the present day would be disposed to entertain. For it has been generally supposed that, as soon as a wound had granulated, the patient was free from any further danger of absorption of noxious materials; and those cases in which symptoms of blood-poisoning supervened after this period were supposed to have received the poison before granulation was complete. And yet, several facts have been for some time known which demonstrate that some substances at least may be introduced into the circulation in this way. Thus Bonnet, in 1852 (*Gazette Médicale de Paris*), confirmed the observations previously made as to the absorption of strychnine by granulating wounds; and he further pointed out that the same was the case with iodine, more especially when applied in the form of an ointment.

The paper just published on this subject by Dr. Hack (*Deutsche Zeitschrift für Chirurgie*) furnishes many new facts of the greatest interest and importance. He was led to his investigation by the following circumstance. A patient was admitted, under the care of Professor Maas of Freiburg, with a very large prostatic abscess, which had burst into the rectum. This was followed by pyæmic abscesses in various parts of the body; the patient soon became extremely weak, and it was found impossible to administer food or stimulants by the mouth. Under these circumstances, Professor Maas determined to introduce stimulants into the abscess cavities, in the hope that they might be absorbed. Camphor-wine was accordingly, from time to time, injected into several of the abscesses; and, a few minutes after each injection, the marked improvement in the pulse showed that absorption had to some extent taken place. In a few days the patient regained his appetite, and was ultimately completely restored.

The chief questions which Dr. Hack has attempted to answer are: What is the absorptive power of granulating wounds at different periods, as compared with that of freshly cut surfaces? Does the form in which the substance is applied, or the manner in which the wound has been treated, affect the result? A large piece of skin having been removed from the back of a dog, a suitable dressing was applied; and in four days, granulation being then complete, this wound was tested as to its absorbing power. Two classes of substances were used, viz., such as could be found in the urine—as ferrocyanide of potassium, salicylic acid, sulph-indigotate of soda; and such as showed their presence by the production of constitutional effects—as pilocarpin and apomorphia. Applied in the form of solution to a sore four days old, treated with water-dressing, the ferrocyanide appeared in the urine in seventeen to twenty minutes; while the same substance, applied in solution to a freshly cut surface, was detected in fifteen minutes. When used, however, in the form of ointment, it was absorbed much more rapidly; and this was still more marked when the salt was sprinkled over the wound in the form of a powder. A similar result was obtained when pilocarpin was employed, the ointment and powder producing constitutional effects more quickly than when applied in the same quantity to a freshly cut surface of the same size. Apomorphia was absorbed from wounds thus treated only during the twelve hours immediately after their infliction. As the wounds became older, it was found that, though the first traces of absorption of the ferrocyanide could still be detected about the same period as in those four days old, yet no marked precipitate could be obtained in the urine till some minutes later. That this diminution in the quantity absorbed in a given time depended on the smaller extent of absorbing surface, and not on any alteration in the granulations, was shown by comparing old wounds with portions of more recent wounds of the same size. Chloride of zinc, applied in an 8 per cent. solution, at once arrested absorption by the granulations. This was also very much diminished by the use of alcohol. Sloughs, caused by the application of strong carbolic acid, absorbed with extreme readiness. Glycerine also aided absorption. Where the wounds were treated antiseptically, very remarkable results were obtained. Granulating wounds thus treated absorbed both more rapidly and in larger amount than even freshly cut surfaces; and substances such as apomorphia, which could not be taken up by wounds treated by water-dressing, produced their physiological effects with great rapidity in this instance. Even after the removal of these dressings, about two days elapsed before the granulations assumed the characters of those treated from the first with water-dressing.

The importance of these facts cannot well be overrated; and it is to be hoped that, attention being thus directed to this subject, more exhaustive investigations will soon be forthcoming. More especially is it necessary to repeat these experiments with putrid substances; for, if it be the fact that granulating wounds, treated antiseptically, can absorb putrid materials more readily than freshly cut surfaces, the practice which some adopt of only treating such cases as compound fractures antiseptically till granulation is established, and of then applying septic dressings, must be dangerous. Dr. Hack, indeed, states that he has observed that erysipelas is especially apt to attack granulating wounds which have been treated antiseptically, if the antiseptic dressings be left off while these wounds are still of large size.—*British Med. Journal*, January 3, 1880.

Materia Medica and Therapeutics.

Preparation and Use of Albuminate of Iron.

Dr. W. DONITZ, of Tokio, Japan, in the *Berlin. Klin. Wochenscrift*, 1879 No. 36, says that the Japanese are peculiarly liable to anæmia, induced by gastric and intestinal catarrh. In searching for a proper form of iron for adminis tration in his numerous cases, he has hit upon the albuminate, which is made up as follows. The whites of one or two eggs are beaten up with about five ounces of water, while six drops of solution of chloride of iron of the German Pharmacopœia are dissolved in an ounce of water in another vessel. The iron solution is then added gradually to the albumen, the mixture being continuously and vigorously stirred meanwhile. At first the mixture is cloudy, but by thorough stirring it becomes almost or quite clear. The cautious addition of a few drops of hydrochloric acid clears up the solution, but this is hardly necessary if the stirring process has been well carried on. When the solution is cloudy or contains clots of albumen, it may easily be filtered. The filtered fluid is brought up to six ounces, so that a tablespoonful will contain one-half drop of the iron solution. For convenience of dispensing the albuminate of iron, it may be dried into thin scales and powdered, since it is easier to dissolve this powder in water than to prepare a fresh supply of the moist albuminate. Dr. Donitz has employed this preparation for the past two years with great satisfaction. It can be given in cases where the stomach is so weak that no other preparation of iron is tolerated. The dose is a tablespoonful thrice daily. Hypodermically, Dr. Donitz has given the preparation in doses of one-eighth of a grain or more in an ordinary syringeful of solution, of which one-half was injected in one locality and the other half in another at one time. No abscesses followed.—*London Med. Record*, Jan. 15, 1880.

On the Transfusion of Blood by Injection into the Peritoneal Cavity

In an address delivered on the 25th July before the Silesian Society "für Vaterländische Cultur" (*Medicinisch-Chirurgische Rundschau*, page 876, 1879), PONFICK gave a very promising report of the results which he had achieved by the simple method of transfusing defibrinated blood into the peritoneal cavity. After briefly reviewing the history of ordinary methods of transfusion, their complication, and the rarely favourable results which followed, he related that in the course of researches which he had been making, for some years, with his pupil Dr. Corda, upon dogs, he had injected into their peritoneal cavity normal as well as defibrinated blood. A very remarkable difference showed itself in favour of the defibrinated blood, which not only excited very little or hardly perceptible local irritation, but also was found to have disappeared very quickly from the peritoneal cavity, and to have been absorbed into the general circulation. Encouraged by the favourable result of experiments on animals, he recently undertook this kind of transfusion in three patients in hospital. In these cases also the result was favourable in that the slight feverishness and the little tenderness of the abdomen which followed the operation, very quickly passed away.

The apparatus with which the transfusion is made is extremely simple. It consists of an India-rubber tube, to one end of which is connected a piece of glass tubing, and to the other a sharp pen-pointed canula, which can be closed by a tap. After the whole of the tube is filled with defibrinated blood, the point of the canula is pushed through the abdominal wall, the tap is opened, and the defibrinated blood is poured, to the required quantity, through into the peritoneal cavity. Such a proceeding causes no distress to the giver of the blood, and causes to the patient discomfort hardly worth naming, or indeed no pain at all. It unites, therefore, great quickness with ample precision as to the quantity of the transfused blood. Above all, it is free from danger to the heart, lungs, or brain; and, further, within the course of the first day a considerable effort may be counted on, which is greatly increased by a second transfusion. In reply to questions, Dr. Ponfick stated that more blood can be infused this way into the body than in any other. Thus, in his first case, he had transformed 240 grammes, in his second

350, in his third 220, without having reached, in his opinion, the maximum quantity. In answer to a question from Dr. Spiegelberg, whether an injection into the peritoneal cavity is really equivalent to transfusion, or is only to be considered as a mode of nutrition due to the destruction of the blood infused, and its use as a nutritive fluid, Ponfick replied that neither in any of his patients, nor in any of the animals of research, was hæmaglobinuria observed, whereas a very limited amount of destruction of blood-corpuscles very soon shows itself in the urine.

Since the reading of Ponfick's paper, BIZZOZERO and GOLGI have undertaken a research which they publish as an original contribution in the *Centralblatt für Medicin. Wissenschaft*, Dec. 20, No. 51, in which they fully confirm by examination of the quantity of hæmaglobin in the circulating blood, the results of Ponfick. Their conclusions are these. The blood-corpuscles injected into the peritoneal cavity do really penetrate into the circulating blood-mass; for, so soon as twenty minutes after the injection, they found in the circulating blood a considerable increase of the percentage of blood-corpuscles. The maximum of this increase they found took place on the first or second day. This increase of hæmaglobin had a direct relation to the quantity of blood injected within certain limits. The most considerable increase in hæmaglobin which they observed, did not exceed fifty-seven per cent. of the original quantity of hæmaglobin in the circulating blood. The increase of hæmaglobin caused by the injection lasted more than a week. In one animal, which they kept for twenty-seven days, there was still a slight increase of percentage of hæmaglobin to be observed. After the maximal point of increase obtained, however, at the end of the first forty-eight hours, a progressive diminution of this decrease followed, although the quantity still remained greater than before. The increase of hæmaglobin was obtained in sound animals as well as in those which had been made anæmic by bleeding. But the maximum of hæmaglobin appeared much more quickly in the latter than in the sound animals. Altogether, their researches speak strongly in favour of peritoneal transfusion of blood, since it is further noticed that in no case was the operation accompanied by any noteworthy disturbance of the health of the animal.—*London Med. Record*, Jan. 15, 1880.

Cold Clysters.

J. LAPIN (*St. Petersburg Med. Wochenschr.*, 1879, No. 22) has continued the investigations of Folty, Ruthenberg, Boyer, and Schlykowa, upon the antipyretic action of cold clysters. The experiments were made upon patients suffering from fever, upon those who had no fever, and upon those who were healthy The temperature was taken in the axilla whilst the patient lay on his back, a well as in the rectum and in the hypogastric region. The clyster of one litre o water at 5° or 10° C. was then administered, and the temperature was agai noted after the water had been ejected. From this method of experiment th following results were obtained: (1) The cold clyster is an active agent in lowering the temperature, its results being tolerably persistent. (2) Clysters of 10° C were in every case well borne by the patients, and sometimes left behind them a agreeable sense of invigoration extending over the whole body, though in oth cases they induced unpleasant sensations in the abdomen. In patients sufferi from recurrent fever they even produced shivering. (3) The diminution in t temperature which occurs after the administration of cold clysters is greater in fev ish patients than in those who are free from fever or who are healthy. (4) Co clysters not only lower the temperature, but also affect the pulse and respiratio to a considerable extent. (5) The most marked diminution is noticed in t rectum and then in the hypogastric region, whilst the least fall is in the temperature of the axilla. (6) Defecation follows the use of cold clysters at variable times in different persons. (7) It is certain that the cold is preferable to the warm clyster in all cases in which an enema is merely required for the purpose of emptying the bowels in non-febrile patients. This is especially the case when it is desirable that these intestines should exercise a tonic action after the evacuation, or that it should be followed by a diminished supply of blood to the pelvic organs. (8) The advantage of the cold clyster over more energetic antipyretic means, such as quinine, alcohol, sodium, salycilate, and other tonics, consists apart from its simple application in the fact that it fulfils other indications besides that of lowering the temperature. (*a*) It removes the stagnation of masses of feces, which are so frequently met with in feverish patients; (*b*) It contributes to the removal of gases, and diminishes meteorism; (*c*) By these means it causes the diaphragm to move with greater freedom, and enables the organism to remove the sources of its self-poisoning by means of the intestinal gases, a poisoning which must occur if only to a small extent at each stoppage in the movement of the feces onwards; (*d*) Cold clysters consequently lessen to a certain extent the afflux of blood from the intestine to the neighbouring organs, such as the uterus and urinary bladder.—*Practitioner*, Jan. 1880.

Medicine.

On Morbid Local Temperatures.

In relation to Prof. Peter's communication to the Académie de Médecine on Morbid Local Temperatures (*Medical News and Abstract*, February, 1880, page 95), Prof. BROCA, at the meeting of the Academy on December 30, related the researches which he had been engaged in on the subject. His communication is published in full in the *Bulletin* of that date, but is too long for insertion otherwise than by abstract.

Prof. Broca, after referring to the observations made long since by Forster, Hodgson, Demarquay, and others, on the influence of ligation of vessels on the temperature of the limbs, adverted to his own thermometrical observations both in individuals the subjects of spontaneous obliteration of the arteries of the lower extremity, and in those the subjects of embolism of these vessels. He has ascertained that the application of the thermometer enables us to distinguish simple localized embolus from the obliteration of the arterial system of the limb—a point of great importance in surgical practice, since, in the former case, when the obliteration is localized, we may by amputation cure the patient of the gangrene caused by this partial obliteration; while in the other case an operation would be useless, as it would be followed by gangrene of the wound. In embolism, then, thermometrical investigations have established that the temperature is increased at the level of the lesion, while it is at first diminished in the parts situated below this, but is afterwards re-established on the re-establishment of the collateral circulation. But if in place of embolism there is obliteration throughout the extent of the arterial system of the limb, the depression of temperature caused by the suppression of the circulation persists in consequence of the impossibility of the collateral circulation being established. If a thermometer is applied under these circumstances the temperature is found to keep diminishing from the root to the extremity of the limb. Prof. Broca states that on several occasions he has been able to determine, by means of the thermometer, whether the gangrene of a limb has been due to an embolic obliteration or to a general obliteration, and to employ the indication thus furnished in determining the propriety of surgical intervention.

His researches concerning the temperature of limbs after ligature and obliteration of arteries led M. Broca to an investigation of cerebral temperature, which he commenced in 1865 while engaged in his researches for the determination of the convolution of language. The employment of the thermometer enabled him to establish the diagnosis of acute and chronic *ramollissement*, and to determine on which side the cerebral lesion existed. For these researches he fixed around the head of the subjects submitted to his observation a crown of thermometers so disposed as to lead to as little loss as possible of heat by radiation. By his experiments made on individuals in a physiological condition—*internes*, *externes*, *infirmiers*, etc.—he ascertained that during cerebral work an increase of temperature is observable opposite the frontal lobe, while opposite to the temporal and occipital lobes no change is observable. Among the applications of thermometry in cerebral pathology, M. Broca first adverts to the observations which he has made on persons the subjects of old torticollis. Under the influence of this lesion they undergo an atrophy of the face and of the cranium, which exhibits a deformity analogous to that which has been described in the pelvis by Naegele, and termed by him the oblique oval pelvis. The temperature is diminished from four to six-tenths of a degree on the side on which the deviation exists; and although this difference is very slight, and at a given moment insignificant, it exerts in the long run a considerable influence on the nutrition and development of the cranium and brain. No cerebral disease exists; but the conditions of the circulation are not the same, the obstacle to the passage of the blood being greater owing to the increased inflexion of the carotid at its entrance into the cranium on that side.

But a much more important application, in a practical point of view, is that which consists in the diagnosis of cerebral embolism. This lesion has almos always its seat in the Sylvian or middle cerebral artery, and the temperature i indicated in the temporal region—a diminished temperature therefore being observable when this artery is obliterated. In this way Sylvian embolism is distinguishable from congestive or inflammatory cerebral or meningeal affections which, like it, may affect the faculty of language. But partial atrophies an chronic *ramollissements*, followed by absorption of the cerebral cortex, which i replaced by a collection of serosity, may also give rise to a diminution of temporal temperature, and this has to be distinguished from that arising from embolism. Here is shown the analogy which exists between Sylvian embolism an femoral embolism. When the Sylvian region ceases to receive blood by it artery, blood is brought to it by the collateral channels, that is to say, by the vessels furnished by the pia mater, the branches of the anterior cerebral artery, and those of the posterior cerebral. These branches and the vascular networks which emanate from them become, therefore, the seat of an exaggerated circulation; and we then find that the occipital thermometer, and especially the frontal thermometer of the bad side, exhibit a higher temperature than those on the healthy side. This elevation of temperature, coinciding with the depression of the temporal temperature, characterizes Sylvian embolism—just as the elevation of the temperature of the knee, coinciding with the depression of the temperature o the foot and the leg, characterizes the obliteration of the lower part of the femoral.

Diagnoses of this kind are interesting in themselves, as they are also for prognosis, without any clear therapeutical indications being deducible from them; but there are also cases in which thermometrical exploration of the brain may render great service to the surgeon. It is acknowledged at the present day that simple depression of the cranium should not be treated by trephining, the injured persons recovering better without resorting to it, and their recovery generally proving definite. But it is also known that certain individuals who have survived these injuries may, at the expiration of some months, some years, or even many years, become epileptic and present signs of chronic meningitis or encephalitis, which are reasonably attributed to the irritating action of bony fragments thrust in towards the cavity of the cranium. Under these circumstances many surgeons have had recourse to the trephine, and many successful results of such interference are on record. Still, this is an operation not lightly to be resorted to; and a man who has suffered from a depression of the skull is not thereby assured from ordinary cerebral affections; and the question arises, when cerebral symptoms appear a certain time after fracture with depression, whether they are or are not the consequence of the depression. This important diagnosis may be assisted by the study of cerebral temperatures. If there be an excess of heat at the level of the old seat of injury, we may admit that this is the seat of the cerebral irritation. But if the temperature here is normal, while a maximum of elevation is exhibited at some other point, we are led to an opposite conclusion, and trephining, indicated in the former case, is here inadmissible.

Prof. Broca agrees with Prof. Peter that the ordinary medical thermometer is the one best suited for these investigations. The scale of the one which he employs, however, extends from 17° + C. to + 43° C.; and the results are only obtained after a long application. To overcome this inconvenience, he had at first the idea of employing thermo-electrical instruments; but, having consulted MM. Froment and Foucault on the subject, they advised his employing the mercurial thermometer. It is this also that M. Béclard employs in his researches on muscular heat. Seguin's thermometer is not calculated for these investigations, as it does not admit of being attached to the part investigated; which, owing to the time required for ascertaining the temperature of the deeper parts, is necessary.—*Med. Times and Gazette*, Jan. 17, 1880.

—

Sir William Jenner on the Treatment of Typhoid Fever.

(*Concluded from page* 90.)

In hemorrhage from the bowel in typhoid fever the blood comes from the floors of the ulcers; the most copious hemorrhages occur at the time of the separation of the sloughs; by the separating of the slough a vessel of some size may be opened. Under such circumstances the hemorrhage is very copious, and the patient may even die on the chamber utensil. Much more frequently the blood, although considerable in quantity, escapes from minute vessels on the floor of the ulcers. I have never known it escape from the mucous membrane, though I have from the hemorrhoidal veins. Although in the majority of cases the bleeding is arrested by nature, the blood lost relieving the vascular fulness of the part, still reliance should not be placed on this natural cure.

When blood in ever so small a quantity is observed in the stools, the patient is to be kept in the recumbent position. He should not be allowed to make any effort, and on no consideration to sit on close-pan or raise himself or be raised by others to pass urine, etc. If the patient is unable to pass urine when in the recumbent position, the urine should be drawn off by catheter. All movement of the bowels should be restrained as far as possible and for as long as possible. An ounce of starch-water with ten or fifteen drops of laudanum may be given at once as enema, and then a dose of acetate of lead every two or three hours by the mouth, with three to five drops of laudanum, or fifteen grains of gallic acid in a wineglass of iced water every two or three hours with the laudanum. I think I have seen benefit from small doses of turpentine. It is a point of the greatest moment to keep the bowels empty, and therefore nourishment should be given in the most concentrated and absorbable form—*e. g.*, essence of meat in tablespoonful doses frequently repeated. All nourishment which leaves solid residue—*e. g.*, milk—should be avoided. Lumps of ice should be sucked, and all essence of meat, etc., be iced. When the loss of blood is sudden and copious, or is frequently repeated, the subcutaneous injection of ergotine may be employed, and an ice-bag applied over the region of the ileum. The faintness due to considerable sudden bleeding from the bowel should not be removed by stimulants unless it immediately threatens life.

Perforation of the coats of the intestine by the extension of the ulcer in depth, and finally by sloughing of the peritoneum is, so far as my certain experience goes, always fatal. I have recorded one case in which this lesion was supposed to have occurred, and to have been repaired, but the patient dying some weeks after of erysipelas of the head and face, I found the perforation was not of the intestine, but of the peritoneum over a softened mesenteric gland. If adhesion occur over the perforated spot of intestine, my experience accords with that of Rokitansky—namely, that such adhesions are never permanent—*i. e.*, permanent enough to permit the recovery of the patient. To give the patient a chance of recovery, absolute rest in the recumbent position must be maintained, and opium be given in quantity sufficient to stop all action of the bowel, and to subdue pain if pain be present. For pain, although in some cases most severe, is altogether absent in others, and this although the patient is perfectly sensible—not only conscious enough to feel pain, but able to tell those about him all he does feel. As any adhesions that form are so easily broken down, inaction of the bowels must be maintained for as long as possible.

Tenderness of the abdomen is not limited to inflammation of the peritoneum from perforation of the intestine; there is often inflammatory vascularity of the peritoneum corresponding to the floors of the ulcers in the intestine, and even lymph may be found thickening the membrane or fixing it to adjacent parts. When death from other conditions has occurred, I have not infrequently found this local preservative lesion to have been attended by very considerable tenderness of the abdomen. A like degree of tenderness arises from local peritonitis over the enlarged mesenteric glands, and also from the mesenteric glands themselves being inflamed from the absorption of irritating matter from the intestinal coats or contents. Warmth and moisture afford relief in the majority of cases, but if the temperature be high, and the tenderness superficial, an ice-bag to the part may be more beneficial, and more grateful to the patient. But the chief indication is to keep the tender part at rest, and to correct the fetor of the stools.

Tenderness in the left hypochondriac region, due to the state of the spleen, is not uncommon in typhoid fever. Enlargement of the spleen is one of the symptoms of most, perhaps of all the acute specific diseases; tenderness of the organ is only occasionally present. It is during the third week of typhoid fever that tenderness of the spleen usually reaches its maximum. When the tenderness is considerable it is a symptom of grave import; the tenderness is not due to local peritonitis, but to the condition of the proper substance of the spleen. For the relief of the state of the spleen indicated by tenderness, although a symptom of great significance in prognosis, I know no remedy of much importance; the application of warmth and moisture over the organ has sometimes seemed to be of service.

From the commencement of typhoid fever the temperature of the patient is elevated. This elevation of temperature is the direct result of excess in destruction of all the tissues of the body. The patient loses weight, and continues to lose weight so long as he is the subject of the fever, so that Zimmerman, fixed the duration of typhoid fever by ascertaining how long after the onset of the disease the patient ceased to lose weight. In local inflammation the temperature of the inflamed part is greatly in excess of the temperature of the body generally. In uncomplicated typhoid fever the elevation of temperature is practically uniform in all parts of the body. Local inflammation, blood-infection, and nerve-disturbance, are common causes of great increase of the temperature above that *proper* to any given case of typhoid fever—*i. e.*, due to the action of the fever poison on the system generally. Thus inflammation of the mesenteric glands is frequently excited by fetid or acrid matters conveyed to them by the lymphatics from the raw and inflamed intestine, and blood-infection may owe its origin to the same cause. Congestive nephritis and pneumonia are common lesions in typhoid fever, and are common causes of increase of temperature. The power of the nervous system to raise the temperature. or to produce sudden changes which raise the temperature, in typhoid fever, is well illustrated by the sudden rise which frequently follows mental emotion. I have known the temperature start from this cause from 102° to 106°. In the progress of typhoid fever local inflammations cause more or less permanent elevation of temperature; blood-infection rapid, and sometimes temporary, always varying, elevations of temperature; nerve-disturbances rapid and often transient elevations of temperature.

The treatment of typhoid fever by cold baths, when the temperature reaches 104°, or even less, is very generally adopted in Germany; but neither my own limited experience nor the evidence adduced by others in its favour has carried conviction to my mind of its advantage. At the same time I entertain no doubt that the direct cooling of the body is in some cases essential to the preservation of the life of the patient—gives him, so to say, his only chance of recovery; while in others it alleviates the severity of a symptom which increases the danger of the patient.

A certain degree of elevation of the body is incompatible with the favourable progress of the case. Thus a temperature of 106°, rising to 107°, and still advancing, will, unless lowered by treatment, speedily end the life of the patient; for these fortunately very rare cases the direct and rapid depression of the patient's temperature by the cold bath is essential—is the only source of hope. Again, a temperature of 105°, if continuous for forty-eight hours, or broken only by a slight fall of short duration, may itself, by the degenerative changes it favours or produces in the heart and other organs, cause the fatal termination; for these cases a tepid bath gradually cooled down is sufficient to bring down the temperature; the bath has to be repeated as the temperature rises. Persons at an age when degenerative changes of tissue naturally occur suffer more from continued high temperature than do younger persons. If the disease be advanced, the skin dry, the patient prostrate, and the internal organs congested, especially the kidneys, a tepid or warm pack is often followed by marked improvement in temperature and in the other symptoms. When the temperature is for some time 103½° to 104½°, and even higher, cold effectually applied to the head (*e. g.*, by the India-rubber tubing cap) will often suffice for its reduction—reduction, that is to say, not only of the temperature of the head, but of the body generally; when the temperature falls the cap should be removed, but be reapplied as often as it rises again. Tepid sponging will reduce the temperature a little, and soothe and quiet the patient if he be restless and sleepless.

Thus limiting the employment of direct means of lowering temperature, I have seen none of the ill effects which are said occasionally to follow its vigorous use—viz., collapse and failure of the heart's power; while I have seen what has appeared to me to be indisputable good follow its employment.

Other means are used to reduce temperature. When the high temperature is conjoined with rapid feeble heart's beat, when the patient is advanced in years, or when the extremities feel cold, though the temperature of the body generally is high, a fall of temperature frequently follows the administration of alcohol. Quinine, in occasional large doses or in smaller doses repeated at intervals, has been followed by reduction of the temperature in typhoid fever. Salicylate of soda is also said to have a like effect. When judging of the effects of these and other drugs for reducing temperature, one must not lose sight of the fact that sudden fall of temperature when no drug is given is of not unfrequent occurrence. and also that the temperature varies daily. This natural fall of temperature I have seen attributed to the drug. I must say that I have been disappointed in the effects of the two drugs I have named as reducers of temperature, while I have seen both occasionally do much harm by disturbing the stomach and interfering with digestion. In a disease which runs a limited course, like typhoid fever, the greatest possible care should be taken to preserve the powers of the stomach, as the life of the patient may depend on his power to digest nourishment towards the end of the disease.

Typhoid fever cannot be cured by perspiration, but the patient suffers much less discomfort and is less restless when the skin is gently moist. The most certain means for producing gentle perspiration I know is the application of a large warm and moist flannel covered with oil silk over abdomen and chest, and the administration of warm bland fluids. In the later stages of the disease, profuse and most exhausting perspiration sometimes occurs. The perspiration is kept up and greatly increased by the heat of the patient's body and the moisture of the perspiration itself. To prevent chill, the nurse carefully covers the patient; thus, with a relaxed skin disposed to sweat, he is kept, so to say, in a prolonged vapour bath. I have seen lives lost from the asthenia thus produced. To restrain this profuse perspiration, the patient's skin should be dried with a warm napkin every few minutes if necessary, and dry clothes placed between the wet linen and the skin. Alcohol should be given at the same time to stimulate the nervous system and increase the force of the heart's action. Sponging with tepid vinegar and water is sometimes of much service.

The state of the heart, as indicated by the frequency of its beats and the strength of its impulse, has always been considered of the greatest significance in determining the treatment to be pursued at any moment in a case of typhoid fever. As a rule, the weaker, the more frequent are the heart's beats. This feebleness and rapidity in excess of that proper to the fever may be due—(1) To changes in the muscular tissue of the heart: *e. g.*, softening with granular degeneration passing into fatty metamorphosis of the muscular fibres. No doubt the occurrence of these changes is favoured by long-continued high temperature of the blood. (2) To the circulation of poisoned blood through the vessels of the walls of the heart; the poison being produced in the system under the influence of the fever, or of its effects. (3) To nerve influence.

Feebleness of the heart's action due to either of these conditions may cause the death of the patient directly by asthenia or indirectly by enfeebled *vis a tergo* producing local congestions. Although the two first-named causes of cardiac weakness are the most serious and the least affected by treatment, the third is the most common, and very frequently greatly exaggerates the effects of the other two.

To avert death from failure of heart power, alcohol is the great remedy. Over defective cardiac action, due altogether to changes in the muscular tissue, when once established, or to the circulation of poisoned blood through its vessels, alcohol exerts comparatively little influence; but when the weakness and frequency of cardiac action are due to nerve influence in part or altogether, then alcohol exerts a singularly beneficial effect on the rapidity and feebleness of the heart's action.

When the patient is, from natural temperament and the effect of the fever poison, in a state of nervous trepidation, or either directly from the mental state or from some appreciable accidental circumstance giving a colour to his hallucinations or his dreams, in a state of fright; a little abdominal pain or disturbance will cause him to start from sleep or awake in fear. Under these circumstances the temperature rapidly rises—I have known it mount to 106°—the pulse becomes extremely frequent, 150 or more, and feeble or irregular. The effect is so great in the patient's state that death has, I believe from cases I have seen, not unfrequently happened. A free use of stimulants removes all the gravest symptoms, the temperature falls, and the heart's action becomes steady; it falls in frequency and increases in power.

Mental disturbance in typhoid fever varies from trifling wandering—from which the patient is readily recalled by directing his attention to some common object or by requesting him to perform some simple act—to the most violent delirium. Delirium due to fever is never conjoined with headache; headache in typhoid fever may be most intense, delirium most violent, but the headache ceases before the delirium begins. If the delirious patient complains spontaneously of headache, then we should doubt the accuracy of our diagnosis; or if that is beyond question, then we must conclude that there is present that infinitely rare complication of typhoid fever, intracranial inflammation. Delirium is, as a rule, one of the symptoms which are influenced for good by alcohol, but it is one in which the effects of the alcohol should be most closely watched. When alcohol is contraindicated or proves useless or injurious, the head should be shaved and cold applied either by an ordinary ice-bag or by the cold water tubing cap, or the head may be kept cold while the force of the heart's action is maintained by alcohol.

There is one nerve symptom to which I attach great and grave significance, and which is a guide to treatment—it is tremor.

Tremor is sometimes so great that the patient is unable to protrude his tongue; his jaw trembles, and his voice quivers; and if he attempts to hold any vessel, he spills its contents, not from weakness or drowsiness, but from shaking of the hands. Tremor out of all proportion to other signs of nervous prostration is evidence of *deep* destruction of the intestine. A small *deep* slough will be accompanied by great tremor; a large extent of superficial ulceration may be unattended by symptoms. Now it is deep ulcers following separation of deep sloughs which are especially liable to give rise to severe hemorrhage and perforation. In these cases of tremor alcohol should always be given to increase nerve energy, and so to limit the sloughing and ulceration to what is the direct consequence of the specific process.

I may sum up my experience in regard to the use of alcohol in the treatment of typhoid fever thus. Its influence is exerted primarily on the nervous system, and through it on the several organs and processes; for example, the heart and the general nutritive processes—changes on which the rise and fall of temperature depend. In judiciously selected cases it lowers temperature, increases the force and diminishes the frequency of the heart's beats; it calms and soothes the patient, diminishes the tremor, it quiets delirium, and induces sleep. It should never be given in the early stage of the disease, or with the hope of anticipating and so preventing the occurrence of prostration and debility, but should be prescribed only when the severity of special symptoms, or the general state of prostration, indicates its use. Hence a large number of cases of typhoid fever end favourably without alcohol being prescribed from the beginning to the terminatio It should not be prescribed when a sudden gush of blood has induced faintne unless the faintness is so great as to threaten life immediately. Nor should it b given when, after the first few doses, the temperature rises, the heart's acti becomes more frequent or more feeble, delirium increases, sleeplessness supe venes, or drowsiness deepens, so as to threaten to pass into coma. When th urine contains a considerable quantity of albumen, alcohol should not be pre scribed, unless absolutely necessary for the relief of some symptom immediatel threatening life, and then it should be given with the greatest caution, and i effects on temperature, the circulation, and on the urinary and other secretio both as to quantity and quality, be carefully and frequently noted. The quanti of alcohol prescribed should be as much only as may be necessary to effect th object for which it is prescribed. In the fourth week, to tide the patient ov the concluding days of the disease, it may, as a rule, be given more freely th in the second or the beginning of the third week of the disease, but it is in e ceptional cases only that more than twelve ounces of brandy in the twenty-f hours can be taken without inducing some of the worst symptoms of prostrati Nearly all the good effects of alcohol, when its use is indicated, are obtained b four, six, or eight ounces of brandy in twenty-four hours. Taken in excess— even when in smaller quantities it would do the patient good—it dries the tongue muddles the mind, or induces delirium or drowsiness approaching to coma, an diminishes the action of the secreting organs, on the healthy action of which th elimination of the materials destroyed by the action of the fever poison depen For the last thirty years I have made it the rule of my practice in the treatm of typhoid fever to abstain from giving alcohol if, in the case before me, I *doub* the wisdom of giving it; when in doubt I do not give alcohol in typhoid fev and when there is a question in my mind of a larger or smaller dose I, as a ru prescribe the smaller. The reverse of the rule I laid down for myself in t treatment of typhus fever.

In conclusion I will briefly sum up the chief points that my experience h taught me in regard of the treatment of typhoid fever:—

Typhoid fever cannot be cured; but more lives may be saved by the judicio treatment, and more lives lost by the improper treatment of typhoid fever, tha of any other acute disease.

For a very large proportion of cases no other treatment is really required fro beginning to end than rest in bed, quietude, fresh air, pure water, and regulate diet, although most cases are benefited by a little wine in the third and fourt weeks. If medicinal, in addition to hygienic, treatment is required, it is becaus special symptoms by their severity tend directly or indirectly to give an unfavourable course to the disease. At the same time, it must be remembered that th gravity of some symptom is in certain cases due to lesions of structure beyond th possibility of successful treatment—*e. g.*, primary deep sloughs of Peyer's patches; and that other grave symptoms pass away spontaneously, although no specia treatment is prescribed for their relief. When drugs *are* required to hold i check a special symptom, their use should be discontinued when the gravity o the symptom for which they are prescribed has subsided.

Temperature so high and continuous as to be a cause of danger, either directl or indirectly by favouring serious degenerative changes of structure, is present i exceptional cases only, and for such cases alone is the direct application of cold to the general surface required.

Alcohol, by the influence it exerts on the nervous system, is of the greatest value in the treatment of typhoid fever, but it should only be given for the purpose of attaining a definite object; its effects should be watched, and the dose so regulated as to attain the desired effect from as small a quantity as possible. As the treatment in reference to many symptoms is in the present state of our pathological knowledge tentative, it may have to be varied frequently both as regards continuance and dose of drugs, of stimulants, and of cold. My experience has impressed on me the conviction that that man will be the most successful in treating typhoid fever who watches its progress, not only with the most skilled and intelligent, but also with the most constant care, and gives *unceasing attention to little things*, and who, when prescribing an active remedy, weighs with the greatest accuracy the good intended to be effected against the evil the prescription may inflict, and then, if the possible evil be death, and the probable good short of the saving of life, holds his hands.

While admitting without reserve that heroic measures, fearlessly but judiciously employed, will save life when less potent means are useless, the physician whose experience reaches over many years will, on looking back, discover that year by year he has seen fewer cases requiring heroic remedies, and more cases in which the unaided powers of nature alone suffice for effecting cure; that year by year he has learned to regard with greater diffidence his own powers, and to trust with greater confidence in those of nature.—*Lancet*, Nov. 15, 1879.

The Significance of Absent Patellar Tendon Reflex.

Dr. C. H. Hughes, from a clinical inquiry into the significance of absent patellar tendon reflex (*Alienist and Neurologist*, Jan. 1880), concludes that, while absent patellar tendon reflex is often of significance as an associated symptom of present locomotor ataxia, and may even serve, when unassociated, to excite suspicion of its approach, we are not justified in regarding it, when it is the only phenomenon observable, as a certain *sign;* or when it is absent and the other symptoms are present, in excluding a diagnosis of posterior sclerosis. It cannot have the diagnostic significance claimed for it, when it may be observed in indubitably healthy states of the cord, and when the reverse condition of exaggerated excitability may undoubtedly be found in cases of unquestionable posterior spinal sclerosis.

Chemical Composition of Bones in the Joint-Affections of Locomotor Ataxia.

M. Regnard has been studying the chemical composition of bones which have undergone those striking changes of degeneration (Académie de Médecine, *Gazette Hebdomadaire*, December 27, 1879) which M. Charcot has pointed out, and of which he has preserved remarkable specimens in his museum at La Salpêtrière. These researches were made on a femoral bone, of which the two extremities were absolutely absorbed and worn away. It was reduced to powder and dried. One hundred grammes of this bone contained of mineral matters, 24.20 grammes; of organic matters, 75.80 grammes; total, 100 grammes. The organic matters were divided thus: fat, 37.70 grammes; osseine, 38.10 grammes; total, 75.80 grammes. The various mineral matters were in the following proportions: phosphate of lime, 10.9 grammes; phosphate of magnesia, 7 decigrammes; carbonate of lime, 11.8 grammes; chlorides, etc., 8 decigrammes; total, 24.20 grammes. The first fact which strikes one is the abundance of fat, 37 per cent., of which the normal bone deprived of its marrow contains very little; then the enormous diminution of phosphate of lime, 11 in place of 48 per cent. The osseine, the carbonates, and the chlorides remain normal. There is, then, more than dry arthritis in the case of these ataxic patients. There exists a real trophic lesion of the bones; a fatty degeneration, with disappearance of the mineral matters. And this confirms the opinion maintained on that point by

Professor Charcot, to whom is due in the first instance our knowledge of this class of disease.—*London Med. Record*, Jan. 15, 1880.

Locomotor Ataxy in its Relations with Traumatisms.

M. Landouzy, in a *résumé* of M. Petit's paper on this subject in the *Revue Mensuelle de Médecine et de Chirurgie*, Mars, 1879, thus sums up his conclusions (*Revue des Sciences Médicales*, Oct. 1879). Traumatisms having direct or indirect influence on the spine, such as falls on the back, the seat, and the feet, bring on concussions of the medulla, and, consequently, lesions which may become the point of departure of a chronic myelitis, and givè rise to symptoms of locomotor ataxy. Up to the present time, it cannot be affirmed that distant wounds possess the same pathogenic influence; but it is probable that, in subjects predisposed to general sclerosis, as arthritic, syphilitic, and alcoholic patients, they may, by over-exciting the medulla, hasten the development of the ataxy. It is certain that distant wounds may revive an apparently cured ataxy, and accelerate the progress of a coexistent ataxy. Various morbid phenomena, the suppression of habitual transpirations, hemorrhoids, menses, cutaneous eruptions, cold, metrorrhagia, pregnancy, intercurrent febrile affections, appear to have a similar action to distant wounds. Ataxic manifestations may localize themselves in regions or organs affected either before or after the appearance of the ataxy. In certain cases, prolonged peripheral irritations have brought on nervous phenomena which have been wrongly designated ataxy by some writers. Appropriate treatment has removed the irritation, and the nervous phenomena have disappeared. As locomotor ataxy is often accompanied by disturbances in the nutrition of certain tissues, it is easy to understand that it may modify the local evolution of wounds. This is to some extent proved by certain cases of contusions of joints, fractures, and wounds of the soft parts.—*London Med Record*, Jan. 15, 1880.

On a Peculiar Form of Spinal Disease in Workmen in Zinc Foundries.

The workmen in the zinc foundries of Upper Silesia suffer from obstinate catarr and irritation of the lung, as well as intestinal canal, and, after a long time, genera cachexia, due to the introduction of zinc vapours or zinc oxide into the organ of respiration and digestion. One peculiar series of symptoms, until now unde scribed, appears, however, to Schlochow (*Deutsche Med. Wochenschr.*, 1879 Nos. 17 and 18) especially to deserve attention. These occur in workmen wh have been occupied in the foundries from ten to twelve years. At first, com plaints are heard of pains in the back, sensitiveness in the soles of the feet, feeling of burning and creeping in the lower limbs, and gradual not rapid o overwhelming pains occurring in the legs. These patients become deaf an rough-skinned, and complain of cold; the sense of touch and perception of pai disappear in particular parts of the lower half of the body, but in an irregula fashion, so that there is often excessive sensibility in the back of the foot and th shin-bone, whilst the walls of the abdomen and genital parts have lost sensibility Reflex irritability is diminished in the skin, as well as in the tendons. There ar no disorders of the functions of the bladder and rectum. Although at the be ginning the muscular power remains, the gait is hasty and irregular. The patient walk with the legs far apart, and tread with the whole sole of the foot. The falter when the eyes are shut, and they go badly in the twilight, so that it is evi dent that a diminution of the muscular sense occurs. During movement, ther occur also often muscular tremors in the muscles of the thigh and of the buttock There is, however, no atrophy of the muscles, nor any loss of electrical excita bility. It is only in advanced stages that the motor power is diminished in the upper as well as in the lower extremities. Schlochow enters elaborately into the differential diagnosis, and arrives at the conclusion that there is in these affections a focus of chronic inflammation in the spinal cord; and that the symptoms depend upon this, and probably also upon the deposit of zinc in the muscle-substance. Tabes, lead-poisoning, cadmium-poisoning, rheumatic and catarrhal influences, are eliminated from the causation of this disease. There remains, therefore, only as the apparent cause the introduction of zinc into the organism. The prophylactic method is the improvement of the ventilation and means for removing the zinc vapour.—*London Med. Record*, Jan. 15, 1880.

Hemorrhages in Whooping-Cough.

At a recent meeting of the Paris Académie de Médecine (*La France Médicale*), M. Henri Roger read a paper on this subject. He treated successively of epistaxis which is produced in a direct way by the convulsive efforts of coughing, and only becomes dangerous occasionally by its abundance and repetition when it is connected with blood-poisoning; of subconjunctival and palpebral ecchymoses, equally dependent on the fits of coughing, which are a good indication of pyrexia, and sometimes serve to distinguish the cough of whooping-cough from common bronchitis; of otorrhagia, purpura, and certain visceral hemorrhages. Hæmoptysis as well as hæmatemesis was afterwards studied in detail; and M. Roger demonstrated by numerous cases that these hemorrhages are exceptional in children. In nearly all cases of whooping-cough, there is pseudo-hæmoptysis, the blood being furnished by the nasal fossæ, the pharynx, the mouth and gums, and never by the pulmonary organs. After epistaxis, the most ordinary hemorrhage is that from the mouth at the moment of the fits of coughing. The gums are congested, become fungous, and bleed; the tongue, violently projected during the paroxysms, becomes eroded by the friction of its lower surface against the teeth, frequently producing ulcers of the frænum; sometimes it is even bitten. The lips are dry, and the little invalid often pulls off the epidermis; and every erosion or ulceration, however small, bleeds when the cough comes on. The starting-point of the buccal hemorrhages is sometimes in the gums, and sometimes in a lesion of the mucous membrane or tongue. The blood may also come from the pharynx, and especially from the nasal fossæ; and, in the latter case, the buccal hemorrhage is accompanied and led off by epistaxis. Sometimes the blood ejected from the mouth has a complex origin, and proceeds both from the nasal mucous membrane and from the buccal cavity. It is only at the end of the paroxysm of coughing that the child throws up bloody froth, arising from the intimate mixture of the blood with the bronchial mucous matter broken up and aërated. This expulsion of blood is of very little moment; and yet few symptoms produce greater alarm in the relatives, and even in the medical attendant of the patient, simply because this bloody ptyalism is taken for an hæmoptysis. Children suffering from prolonged attacks of whooping-cough might have been suspected to be affected by tuberculosis. Examination of the mouth, however, would have been sufficient to indicate the source of the blood. M. Roger has shown that it is only after their tenth year that young subjects are liable to spitting of blood; and that this symptom, which nearly always marks the commencement of phthisis in adults, is exceptional. Early childhood, which is ruthlessly ravaged by tuberculosis, may be pronounced exempt from hæmoptysis; pulmonary hemorrhage rarely, if ever, being at that age the initial symptom of phthisis. M. Roger does not hold that true hæmoptysis is impossible; but he affirms that it is rare, and on this point differs from Trousseau, who asserts it to be rather general. In the same way as there is pseudo-hæmoptysis i whooping-cough, there is also pseudo-hæmatemesis. When a child sufferin with whooping-cough seems to vomit blood, the nasal fossæ should be carefull examined; and it is soon seen that the blood has flowed by the posterior nare and often insensibly into the stomach, where it may accumulate in considerabl quantity. If it be expelled almost immediately, the flux by the nostrils is stil visible; if it be tardily evacuated, when the epistaxis has ceased, some drops o clots on the nose may point out whence it comes. Hæmatemesis is, like hæmoptysis, quite exceptional in extreme youth, and only very rarely met with i sparse cases of purpura hemorrhagica. To resume: there are two kinds of hemorrhages—hæmatemesis and hæmoptysis—which the physician should erase fro the list of the complications of whooping-cough.—*British Med. Journal*, Januar 3, 1880.

The Terminations of Pneumonia.

Few observations or theories in medicine which have once been regarded a unassailable, escape question in succeeding generations. Many of them als undergo a period of denial and sometimes of re-establishment. Further investigation demonstrates that the observations, if not the theories, of older worker deserved more regard than had always been accorded to them. The question o the terminations of pneumonia furnishes an illustration of this, as Professo LEYDEN has shown in an excellent lecture delivered to the Charité Medical Society, and published in the *Berlin Klin. Wochenschrift*. The old pathologist taught that pneumonia which did not resolve might end in suppuration, in gangrene, or in chronic inflammation and induration; and although in this countr these methods of ending, as occasional rare events, have perhaps never bee doubted, they have not escaped question at the hands of German pathologist more than one of whom has doubted whether these terminations of acute fibrino pneumonia ever actually occurs. The occurrence of these events is in itself extremely difficult of proof, the ground for doubt being the question whether th pneumonia thus ending was really of the acute fibrinous variety in a previousl healthy lung, a point naturally not easy of demonstration.

The termination of acute pneumonia in suppuration, in abscess of the lung, wa first doubted by Laennec, and it is certain that such ending is far less commo than was at one time assumed; but it must, in Leyden's opinion, be regarded a unquestionable, and he cites a well-marked instance which has been recorded i the last volume of the "Charité Annalen." A similar doubt has been expresse regarding the termination in gangrene. It is certain that a large number of th cases of inflammation of the lung which terminate in gangrene have a specia type, which suggests that they differ essentially from cases of primary fibrino pneumonia. Crucial cases are difficult to find, but Leyden in this paper add another to a series previously published—a case in which the patient came unde observation on the fifth day of illness and died on the twenty-third, and hepatization in the lower lobe coexisted with diffuse gangrene in the upper. There wa no trace of circumscribed or embolic process. The patient was extremely prostrated by the pneumonia, and with the diminution of the fever the heart's weakness increased still more, and it is assumed that the compression of the vessel by the exudation was greater than the feeble heart could overcome.

The question of the termination of pneumonia in chronic inflammation of th lung is of the greatest practical importance and of the greatest difficulty. W must consider, not merely its termination in induration, but in all those chroni processes which may lead to phthisis—as caseous pneumonia and desquamativ pneumonia. Can phthisis result from acute pneumonia in a previously healthy lung? At first sight the answer appears simple. Many cases of phthisis appear from their history unquestionably to have commenced with acute pneumonia. But more careful examination into the history of such cases demonstrates that in the majority, the pneumonia was not of regular course, but was evidently subacute or chronic. Cases in which the pneumonia was really acute are very rare, and even here we are in doubt as to whether the lung was not previously the seat of phthisical changes. The difficulty of the proof is very great in the case of hospital patients, who come under treatment only when the disease is developed or advanced, and Leyden believes that the process has not yet been demonstrably proved, while one of the first authorities in Germany, Buhl, denies that it occurs.

If we consider the anatomical processes, fibrinous pneumonia appears at first far enough removed from the changes in phthisis, but in the stage of resolution the difference between the two processes is smaller, and is diminished still further if we deny that the phthisical process has any specific characters. Thus the possibility of the result must, on anatomical grounds, be conceded, and its clinical probability, as we have seen, is great, but the actual proof has not yet been given, and is not quite furnished even by a case which Leyden adduces as affording almost a proof. The pneumonia came on in a man twenty-two years of age, after exposure to cold, but at an interval of fourteen days, which constitutes a weak point in the case. The inflammation ran a normal course, except for the incompleteness of resolution. The temperature became natural, but shortly afterwards the investigation of the sputum showed the existence of commencing phthisis, which the physical signs soon confirmed.

Simple retarded resolution in pneumonia is a condition of much practical importance. In some cases the physical signs remain for weeks, and even months, and then slowly disappear. Leyden states correctly that many such cases, coming under treatment at a later stage, are regarded as cases of phthisis, and help to swell the numbers of cases of consumption. Their distinction may be, as Walshe long ago insisted, most difficult. Leyden points out as the differential signs the persistence of the crepitant râle at the end of inspiration (by no means, however, we think, always to be heard), the absence of large mucous râles, the slight degree or absence of retraction, and especially the examination of the sputum. This is scanty, greenish-yellow, and consists of fine threads and small globes, which are composed of pus-corpuscles and degenerated epithelium of the air-cells. He insists strongly on the importance of the microscopical examination of the expectoration in all such cases, and adds a series of illustrative cases, one of which is particularly instructive, since the pneumonia came on under observation, the patient being in hospital on account of enlargement of the liver, and ultimately dying of ulcerative endocarditis.

With regard to the causes of retarded resolution, Leyden points out that the process is influenced by age, occurring less readily in the old, but that this rule is of very limited application, since most of the cases he has recorded occurred in youthful persons. Physicians who see much of the diseases of children will probably agree with us, moreover, that the process is seen now and then in striking form quite early in life. We call to mind a case in which an acute basic pneumonia, of typical course, in a boy of five years, remained unresolved for three months, and then only cleared on removal to a higher altitude. Leyden insists also, with justice, on the influence of weakening of the circulation by the pyrexia, or by the other causes, and instances the tardy resorption of inflammatory exudation generally, in the pleura, pericardium, or peritoneum in those whose strength is low. A second, also important, element he believes to be an

unusual density of the infiltration. Most of his cases suggested such a conditio
in an intense degree of dulness and slightness of râle. Similar dense infiltratio
is sometimes found in the young, so as to quench every sound at the height o
the pneumonia. In the case which was investigated after death the view wa
confirmed in so far that, in many alveoli, there were very dense and firm plug
of fibrin, and it is readily conceivable that such plugs may resist disintegratio
much longer than those which commonly occur. An important aspect of th
question is as to the anatomical changes which take place in the lungs in thes
cases, and which do not pass away when the retarded resolution takes place. D
such lungs recover perfectly, or are there not always changes in varying degre
similar to those the origin of which has been admirably traced by Dr. Wils
Fox in his article on Chronic Pneumonia in Reynolds's "System of Medicine.
It is hardly conceivable that a lung can remain functionless for months, with soli
instead of air within the air-cells, with the circulation persisting so as to nouri
the walls of the air-cells, without these undergoing perversion of nutrition su
as to prevent them recovering a normal state, even though the exudation withi
them is cleared completely. The point must await future investigation for i
settlement.—*Lancet*, Jan. 3, 1880.

Iodide of Potassium and Iodide of Iron in Tuberculosis.

M. Lebert, in his newly published work on Pulmonary Phthisis, devote
chapter to the treatment of this disease. His practice in this respect dif
notably from that usually adopted. Convinced of the inflammatory nature
tuberculosis, M. Lebert makes frequent use of iodide of potassium, which he
never found injurious, but, on the contrary, very advantageous in slightly
veloped tuberculosis. It must not be prescribed when hectic fever, caverns,
consumption supervene; not that it is injurious, but simply ineffective. In
first phases of tubercular evolution, even after a certain number of foci h
formed, it may do good service, but it must be given persistently and in do
from thirty centigrammes (4½ grains) to one or two grammes (15 or 30 grai
daily. It is the same with iron, and the iodide of iron, which, notwithstandi
the fear in which it is held by many physicians, is useful as soon as weakness
anæmia progress. According to M. Lebert, the best preparation is Blanchar
pills, of which he gives two at first, going on to six or more in the four
twenty hours. Syrup of iodide of iron made according to the following form
is also a favourite medicine with M. Lebert: Iodide of potassium, 4 gramm
sulphate of iron, 2 to 3 grammes; cinnamon water, 30 grammes; syrup of ora
flower water, or syrup of orange peel, 150 grammes. A dessertspoonful is
be taken twice a day at first, and increased gradually to two or three tablespo
fuls in twenty-four hours. M. Lebert also recommends benzoate of iron
cod-liver oil combined, with iodide of iron in somewhat complex preparatio
He often also prescribes iron when not in combination with iodine. He read
prescribes from twenty to thirty centigrammes of lactate of iron per diem, or
dyspeptic conditions he administers an effervescing powder composed as follo
Lactate of iron, 4 grammes; bicarbonate of soda, 12 grammes; tartaric acid,
grammes; sugar, 4 grammes. This should be compounded and put into a wi
mouthed bottle. The patient takes it twice a day in doses of half a teaspoon
or a teaspoonful in a quarter of a glass of sugar-water at the moment of ef
vescence. Iron does not act in tuberculous maladies directly on the foci of
disease, but specially on digestion and nutrition, and helps to restore the streng
It is generally useful in tuberculosis, whether more or less advanced. It is
the best remedy in those chloro-anæmic conditions which without actually belon

ing to phthisis yet predispose powerfully to it.—*London Med. Record*, Jan. 15, 1880.

On Patency of the Interventricular Septum.

M. ROGER'S conclusions (*La France Médicale*, No. 86, 1879) on this subject are as follows. There is a malformation of the heart, in which there is no yanosis, though a free mixture of the venous and arterial blood takes place. This malformation, which is compatible with life and even with a prolonged existnce, when it is simple and without the co-existence of a stenosis, also congenital, f the pulmonary artery, is patency of the ventricular septum. It is revealed ly by auscultation; it is indicated by a physical sign, of which the characters e quite special. There is a murmur very prolonged and unique, which comnces at the systole, and is prolonged in such a way as to entirely cover the ural tic-tac; it has its maximum, not at the apex, as in alterations of the iculo-ventricular orifices, nor at the right base, as in contraction of the aorta, r at the left, as in pulmonary stenosis, but at the superior third of the præcorl region; it is median, as is the septum, and from this central point it dinishes in intensity regularly and in proportion as it extends; it is fixed, and ot propagated into the vessels; it is associated with no other sign of organic fection except purring tremor. An anomalous *bruit*, possessing this group of racters, is the pathognomonic sign of patency of the interventricular septum. e age of the patient is an important element in the diagnosis; a murmur in an fant at the breast being almost certainly an indication of some anomaly of the tal circulation. The prognosis is far less grave than in cardiac disease, as life y be prolonged to beyond middle age. As regards treatment, the diagnosis is portant; for, while active treatment is necessary in cardiac disease, it is useless, d even harmful, in cases of malformation.—*Lond. Med. Record*, Jan. 15, 80.

Employment of Pilocarpine in Uræmia.

We give a summary (*Deutsch Med. Wochen.*, No. 26, 1879) of four observans by M. BÆGCHOLD, of cases marked uræmia, in which pilocarpine was ployed in the form of subcutaneous injections.

CASE 1.—Child, aged five years. Grave uræmia during convalescence from latina. An injection was made of eight milligrammes of pilocarpine; consions ceased at the end of an hour, and she recovered consciousness. After e days a fresh attack was cured in the same way by two similar injections. The injections were made regularly during twenty days, and the attacks were t renewed. Ten days later the albumen had disappeared, and the cure was mplete.

CASE 2.—Boy of twelve years, seized with uræmic convulsions during convascence from scarlatina. Injections of one centigramme of pilocarpine stopped the convulsions at the end of six minutes on two different relapses. Cured.

CASE 3.—The injections stopped the convulsions, but the patient was comatose, and death ensued.

CASE 4.—Aged seven years; chronic nephritis. Convulsions ceased under the influence of pilocarpine injections, but the child succumbed to the progress of the disease.

The results obtained by Bægchold appear to show that pilocarpine may be a seful agent to combat one of the most alarming and most dangerous symptoms, but its utility against the disease itself seems to us doubtful. However, as it stops the convulsions, it might be, perhaps, favourably employed in puerperal eclampsia; and this is a point which deserves consideration.—*Gazette Hebdomadaire*, Jan. 30, 1880.

Pyonephrosis, and Excretion of Liquid Fat and Hæmatoidin Crystals throug the Urine.

Professor **Ebstein** publishes in the *Deutsches Arch. für Klin. Med.*, Ban xxiii, the following case, which had come under his notice. A woman aged had been suddenly taken ill with high fever and gastric disturbance. When received into the hospital seven days later, the temperature had become normal but on the left side of the abdomen was a swelling of the size of a child's head which evidently belonged to the left kidney. The secretion of urine was scant though normal. Twelve days after she entered the hospital, she began to com plain of pain resembling a sharp attack of colic, in the region of the bladder an the left ureter. The urine which was passed at that time was strongly tinge with blood, and contained a great quantity of clots of blood, but no casts. Durin the following days, the renal tumour decreased in size; but the urine continue to be bloody for the next eight days. The quantity of urine excreted had con siderably increased. Six days after hæmaturia had first been observed, it wa noticed that the urine, after standing, became covered with a layer of numero drops of fat, giving it the appearance of very rich *bouillon*. This secretion fat through the urine continued for the next four weeks, when the patient le the hospital. If examined immediately after the urine had been passed, th drops of fat were of a fine yellow colour, clear and transparent; but, on havin been allowed to stand, they presented a grayish colouring, and coagulated int whitish scaly masses. When examined under the microscope, the latter wer seen to consist of bundles of fine and slightly curved acicular crystals and hæmatoidin crystals, and of amorphous pigment. The sediment of the urine contain red blood-corpuscles, pus-cells, pavement-epithelium, occasional fat drops whic contained needle-shaped crystalline bodies, and yellowish shreds and patch resembling blood clots in a state of degeneration, and containing large numbe of the fat drops described above. Renal epithelium or casts were never observe Ebstein supposes that the case was one of pyonephrosis of the left kidney, rather a case of "pyo-hæmatoliponephrosis;" and that the excretion of fat an hæmatoidin was caused by the degeneration of the blood-clots.—*British Me Journal*, January 3, 1880.

The Relationship of Bright's Disease to other Diseases. The Secondary Form of Nephritis.

The subject of Bright's disease is one which is far from being exhausted as ye and many points in its history still require elucidation. Professor **Bamberge** of Vienna, has therefore done good service[1] in utilizing the vast resources of th Allgemines Krankenhaus to try and clear up difficulties and open up new path of investigation into the pathology of this disease. His essay is founded on h own long clinical experience, and also on 2430 post-mortem examinations i which the anatomical diagnosis of Bright's disease has been made in the Pathological Institute at Vienna during the last twelve years. The total number patients of all kinds, excluding children, during this period was about 250,00 the total number of necropsies 19,000. The cases diagnosed as Bright's disea do not include amyloid disease, or nephritis due to circulatory obstruction (*Sta* ngs-Hyperämie*) or to embolism or pyæmia, unless accompanied with true parenchymatous or interstitial nephritis. On the other hand, they include the nephritis which occurs in acute infectious diseases, and especially in typhoid and puerperal fevers, this form being classed under the head of acute Bright's disease. The Vienna pathological classification arranges cases of Bright's disease under three heads, the acute, the chronic, and the atrophic. Those cases in which the kidneys exhibit the anatomical appearances of inflammatory swelling are under this system reckoned as "acute," though clinically they may be chronic cases with acute exacerbation. By "chronic" is meant that form of nephritis in which the epithelial element is chiefly involved (parenchymatous, or tubal nephritis); by "atrophic," that which is known in England as interstitial nephritis, where the bulk of the organ becomes gradually reduced by connective tissue proliferation and contraction.

---

[1] "Ueber Morbus Brightii und seine Beziehungen zu anderer Krankheiten." (Voll mann's Sammlung Klinischer Vorträge, No. 178.)

With regard to this classification, we should say that Professor Bamberger recognizes no abrupt line of demarcation between the parenchymatous or tubular, and the interstitial or granular contracted forms of chronic nephritis. They shade insensibly into one another when a large number of cases of Bright's disease are examined post-mortem. There are marked examples of both forms, and endless intermediate forms between the two extremes. The same is true of the *clinical* history when a sufficient number of cases are observed. We get typical examples of chronic Bright's disease where the symptoms of the classical descriptions of tubular and interstitial nephritis are found associated, each with their proper morbid appearances. On the other hand, as Bamberger points out, there are three other contingencies. In the first place, cases diagnosed as interstitial nephritis during life turn out at the necropsy to be either cases of tubular (parenchymatous) nephritis, or combinations of the latter with interstitial changes or even with amyloid degeneration; or, secondly, the symptoms may be very nearly those of tubular nephritis and the kidneys be in a highly contracted state; or, thirdly, the symptoms may correspond partly (especially in the earlier stages) to those tubular and partly (especially in the latter stages) to those of interstitial nephritis. Hence Bamberger's experience leads him to the belief "that the clinical aspect of Bright's disease depends less on the anatomical form of the kidney-mischief than on the acute or chronic character of the illness, and on the conditions which accompany and follow it—*e. g.*, renal hyperæmia and hemorrhage and cardiac hypertrophy." We should remark, in passing, that among German pathologists the tendency appears to be less to discriminate a number of characteristic forms of Bright's kidney than to show how interstitial, tubular, and even amyloid changes may occur in varying proportions in all possible combinations with one another. Our space will not permit us here to do more than refer in proof of this statement to the recent admirable essay of Dr. Carl Weigert, of Leipsic,[1] which sums up the results of several years exclusive work at the pathology of Bright's disease. Weigert comes to the conclusion that interstitial and tubular changes are inseparable in the same kidney, that degeneration of renal epithelium is a prime factor in the production of interstitial connective tissue proliferation, and that our classification of the forms of Bright's disease must mainly be based on their *chronicity*. Hence his provisional arrangement of them is into four groups—acute, subchronic, chronic, and very chronic nephritis; the symptoms corresponding to each form depending on the predominance of tubular disease in the acute and subchronic forms, and on the gradual coming to the form of interstitial changes and granular contraction in the chronic and very chronic forms. We shall hope to speak more in detail of Dr. Weigert's essay at some other time.

---

[1] "Die Bright'sche Nierenerkrankung vom pathologisch-anatomischen Standpunkte." (Volkmann's Sammlung Klinischer Vorträge, Nos. 165, 163.)

To return to Professor Bamberger: he has utilized the material at his disposal for two main purposes—first, to study the relations of Bright's disease to other antecedent diseases; and secondly, to clear up the natural history of this affection when occurring as a primary disease in a previously healthy person, especially with reference to its complications and sequelæ. In this part of the subject he enters at considerable length into the discussion of the mode of origin of cardiac hypertrophy in chronic Bright's disease. It will be best to follow Professor Bamberger's plan, and treat first of the secondary forms of nephritis. Of these, 1623, or 67 per cent. were represented in his 2480 cases. Anatomically, the secondary and primary forms differ but slightly. Amyloid disease of the renal arterioles is, however, much more common in the former, while the alterations in the kidney generally are also usually less advanced in it than in the primary forms, because the latter are seldom fatal in the acute stage, and generally have undergone considerable development before they are met with on the post-mortem table. Clinically, the secondary forms of Bright's disease are characterized by the frequency with which the renal symptoms are overshadowed and obscured by those of the original disease, and by the rarity of cardiac hypertrophy (3.3 per cent. in the secondary, against 42.6 per cent. in the primary form), except in cases with concomitant valvular disease, endarteritis, aneurism, or emphysema. The following table represents numerically the etiological relationship of secondary Bright's disease to other diseases, and the proportion of acute, chronic, and atrophic (granular contracted) cases associated with each. The percentages refer to the total number of the cases investigated, both primary and secondary, viz., 2430:—

Primary disease.	Bright's disease. Acute form.	Chronic form.	Atrophic form.	Total.	Percentages.
Tuberculosis, phthisis, scrofula	47	257	76	380	15.7
Valvular disease of heart	19	117	86	222	9.1
Pregnancy and puerperal affections	80	56	16	152	6.3
Diseases of urinary organs	11	72	51	134	5.5
Suppurative process	42	77	10	129	5.2
Alcoholism, cirrhosis of liver	16	68	33	117	4.8
Cancer	13	55	35	103	4.2
Emphysema of lungs	6	51	28	85	3.5
Typhoid fever	42	14	2	58	2.4
Syphilis	4	29	16	49	2.0
Scarlet fever	18	0	0	18	0.7
Intermittent fever	1	9	3	13	0.5

A few cases not included in this table were the results of cholera, pneumonia, diphtheria, smallpox, scurvy, dysentery, etc.

What strikes us most in this table is the remarkable frequency with which Bright's disease and phthisical and scrofulous processes are associated. Bamberger believes that this point has never before been brought out with sufficient clearness by other observers. As far as English writers on phthisis are concerned, we have long been surprised at the way in which the subject of the connection between phthisis and albuminuria has been passed over by them. We should probably be within the mark if we said that our authorities on renal disease, with one or two exceptions, have also been contented to consider amyloid degeneration as the only common form of renal disease which complicates phthisis. As a fact, Bamberger finds that while amyloid disease in the kidneys and in other organs is a tolerably frequent attendant on chronic phthisis, the parenchymatous or tubular form of nephritis is far the most common condition. True tuberculosis of the kidneys, and caseous inflammation of the mucous membrane of their pelves are, on the whole, very seldom met with. Professor Bamberger considers that clinical experience can leave scarcely a doubt that the phthisis is really the antecedent of the nephritis, and not *vice versa;* and he points out how rarely phthisis actually occurs in persons who are already the subjects of Bright's disease. Valvular diseases of the heart, which come next in the list, include all forms of these affections, one of the commonest in association with renal disease being simultaneous disease of the mitral and aortic valves. Bamberger regards venous stasis as at least one factor in the production of tubular and interstitial changes. The number of cases of chronic and atrophic Bright's disease, especially the latter, associated with the pregnant and puerperal state is interesting; and Bamberger is of opinion that in some of them the nephritis must have existed before pregnancy, for else the time would have been too short for the process to have reached the atrophic stage. We shall see in another article that *primary* Bright's disease is more common in women than is generally supposed; but we should also remember how rapidly interstitial alterations may follow tubular nephritis, as Aufrecht found in rabbits in which the ureter of one side was tied.[1] We need scarcely discuss here the relationship of Bright's disease to diseases of the pelvis of the kidneys, of the ureters, and of the bladder, for it has long attracted the attention of surgeons. Bamberger specially notices hydronephrosis and pyelitis and purulent nephritis as frequent complications in this section. The frequency of amyloid disease in connection with chronic suppuration is also well known. The effect of chronic alcoholism in inducing Bright's disease seems clear from Bamberger's table, though some authorities have tried to deny it. It is chiefly the ulcerative and multiple forms of cancer which are associated with renal diseases. With regard to emphysema, Bamberger thinks that it is sometimes not the cause, but the result, of the Bright's disease, and arises in consequence of capillary bronchitis secondary to the latter. Sometimes the two affections may be merely collateral, and both dependent on the patient's age. The condition of the heart he considers the best guide to the determination of their causal relationship to each other. "If the emphysema is the primary disease, the right side of the heart is hypertrophied, the left normal. If the left side is also hypertrophied, the emphysema cannot be the primary disease, but either a sequela or a chance complication of the nephritis, and the nephritis is probably primary, seeing that secondary Bright's disease very rarely leads to cardiac hypertrophy." The other sections of the table need not detain us; we need only observe that Bright's disease as a sequela of scarlet fever is so sparingly represented in it because at Vienna, as a rule, children under twelve years—who, of course, are its chief victims—enter the St. Anne's Children's Hospital, instead of the General Hospital.

Turning now to the common factors which must exist in all the diseases that are found to give rise to Bright's disease, Professor Bamberger points out that they can be arranged in three groups, each of which is based on a distinct pathological element. In the first group, which is also the most important of the three, this element is of a poisonous nature. The kidneys are damaged by some chemical substance which passes through them as the great excretory organs of waste products, and which may either be introduced into the system from without, or be manufactured in the system itself. Of the former class alcohol is the chief representative; other bodies which irritate the kidneys, such as cantharides and squills, are known, but their effects are temporary, and it is uncertain whether their prolonged use in small doses would excite actual nephritis. Bamberger is sceptical as to the toxic action of lead, whereas it is admitted by Weigert in his essay. Would Bamberger deny that there is some causal relationship between lead-poisoning, gout, and granular contracted kidney? The poisons manufactured in the system itself are probably more important factors in the production of chronic Bright's disease than those external to it. They are the products "of self-infection, caused by the absorption of organic material destroyed by suppuration or gangrene, and of the lowly organized, rapidly proliferating bodies which cling closely to it." In this category we have scrofula, tuberculosis, and phthisis, caries and necrosis of the bones, suppurative inflammation of the joints, skin, and subcutaneous connective tissue, ulcerating cancer, typhoid ulcers of the bowel, etc. "More than a third of all the secondary forms of Bright's disease," says Bamberger, "may probably be referred to it."

---

[1] Centralblatt Med. Wiss., Nos. 19, 35, 1878.

The element in the second group is venous congestion due to heart or lung disease. It needs no detailed discussion. In the third, and the numerically smallest group, the exciting cause of nephritis is retention of secretion owing to mechanical obstruction, such as urethral stricture, pressure on the ureters, and the like. It is difficult to decide whether the stagnating secretion exerts a chemical as well as a mechanical action on the kidney. Bamberger inclines to the belief that it does both; and he also considers that in some cases of chronic Bright's disease a combination of two, or even of all three of the groups, may have been at work. Thus, in pregnancy, venous stasis and pressure on the ureters may both co-operate, and in puerperal inflammations the toxic element of the first group may be superadded.

In another article we shall offer our readers the results of Bamberger's investigation of the primary form of Bright's disease, which are no less instructive than those we have just been discussing.—*Med. Times and Gazette*, Jan. 3, 1880.

On the Combination of Lupus and Carcinoma.

Kaposi (*Viertelj. f. Dermat.*) has thrice remarked the combination of lupus and cancer. Two of these have been already described. The third affected a day labourer, forty-three years of age, who had suffered from lupus on various parts of the body for thirty years. In the centre of a large patch of lupus on the upper arm there was a prominent tumour, warty in character, of the size of the fist, which secreted a rank-smelling discharge and was gangrenous in parts. This was separated by a furrow 4 mm. broad from the surrounding lupus surface, and had developed in the course of a few months. The tumour was an epithelial cancer, whose cancer elements pushed their way between the lupus nests. Kaposi insists that a structural transformation between lupus and cancer in ordinary cases of lupus can scarcely be accepted in endeavouring to find some histogenetic reason for the development of cancer out of lupus. But in lupus epithelial hyperplasia occurs in an abnormal form, in which the rete pushes down long projections into the inflamed and lupus-infiltrated corium. These form a mesh-work of epithelial cells in the latter, and convey the impression of an epithelioma. Kaposi sees in such a non-typical cell growth, when associated with lupus, the basis and opportunity for the development of cancer, the further rapid progress of which in the lupus areas is easily explained by its pathological nature. The operative removal in this case was conducted by means of an elastic ligature, by the galvanic cautery, and later on by destruction by caustic potash. The result was favourable. Kaposi suggests, as useful in such cases, the painless cauterization by an ointment of pyrogallic acid, which he has recently had under trial.—*Edinburgh Med. Journal*, Dec. 1879.

Surgery.

Treatment of an Erectile Tumour by the Injection of Chloral.

In a case of rapidly extending erectile tumour, situated in the naso-palpebral region, Dr. Antonio Pupi (*La France Médicale*, No. 83), after failing to arrest the disease by other methods, succeeded in curing it by injecting chloral into the base of the tumour. He was led to try this method from the fact that chloral is not only a hæmostatic and cicatrisant, but that it also has the power of coagulating recently drawn blood, the coagulum so formed being insoluble. Three injections were made, at intervals of fifteen days, the strength of the solution being 1 to 10 of distilled water. Each injection was followed by tumefaction, which, however, was painless, and lasted only four or five days. The cure was so complete, that the traces of the tumour could be detected only by one who was acquainted with the case.—*Lond. Med. Record*, Jan. 15, 1880.

—

Treatment of Dacryocystitis and Lachrymal Fistula.

Every surgeon knows how tedious and unsatisfactory the treatment of such cases often is, and how much patience and perseverance is necessary to obtain even a very small modicum of success. Dr. Fonseca (*Correio de Medico de Lisboa*, No. 22, November 15) proposes to remove this reproach from surgery, and has published a series of cases in which he has successfully treated epiphora dacryocystitis, and lachrymal fistulæ, by means of very small probe-pointed sounds, uniform in size. These are passed into the sac, either through the upper or the lower punctum, without previous incision. This treatment can often be advantageously supplemented by injections of cold water. The same sized probe should always be used, and that at intervals of three or four days. The author is opposed to the use of a series of probes of increasing size, and considers Bowman's treatment unnecessarily severe. One case of epiphora, complicated with dacryocystitis and fistula of five years' standing, was cured completely in sixteen days. The author concedes that the method may not be applicable to all cases; but where it is applicable, it will give better results, with more rapidity and with less risk of danger to the mechanism of the parts, than any he is acquainted with. [The above treatment has already been extensively practised by Becker of Heidelberg, and Dr. de Wecker of Paris. The author is, no doubt, right in his views regarding the value of injections, and the unnecessarily large probes that are often passed. In most cases, however, a partial slitting up of the canaliculus will be found necessary. Injections can only be of use in cases where, along with an unhealthy condition of the mucous membrane of the sac, the puncta are not displaced or the canaliculi or ducts organically altered.]—*Lond. Med. Record*, Jan. 15, 1880.

Atrophy of the Optic Nerve in Erysipelas of the Face.

Parinaud (*Centralb. für d. Med. Wiss.* 1879, p. 614; from *Archives Gén.*) says that only six cases of this nature can be found in literature. He describes two additional instances. The first is that of a woman, aged 26, who ad suffered from erysipelas running its usual course, and in whom a sudden increase of temperature took place, with severe headache on the left side. During the next few days, the patient observed a marked diminution in the sight of the left eye, while the right became almost totally blind. Ophthalmoscopic examination showed neuritis anterior. At the end of a month, distinctness of vision had somewhat improved, but it never entirely returned. The second case, in a person aged 59, was very similar, both eyes, however, being affected to about the same degree. In five of the cases referred to, one eye only was affected. In the sixth case, as in Parinaud's, both were diseased. Parinaud thinks that the unilateral eye-trouble depends upon an affection of the optic nerve alone, which does not extend to the chiasma. In the double cases, the origin of the trouble is to be sought for in the central organ.—*Lond. Med. Record*, Jan. 15, 1880.

Apparatus for Washing Out the Middle Ear.

In the *Deutsche Med. Wochenschrift* of November 1, Dr. A. **HARTMANN** of Berlin describes an instrument which he has devised for washing out the cavity of the tympanum. This consists of a straight silver tube two millimetres thick and eight centimetres long, the middle portion of which is perfectly straight, the end for insertion into the tympanic cavity being bent at nearly a right angle; this bent part measures only about one millimetre. The opposite end of the tube is curved at an open angle, and swells out so as to afford attachment to an India-rubber tube connected with a syringe. The tubing should be as thin and light as possible. The instrument is generally introduced into the tympanum through the speculum, and with the light reflected from the usual mirror. In using the apparatus, only a very gentle stream should at first be injected, and if this be well borne, it can be gradually rendered stronger. The conditions in which washing out the cavity of the tympanum is indicated are, in the author's opinion, the following. (1) In all cases of chronic purulent inflammation of the middle ear, in which it is suspected that, besides the secretions removed by the usual injection, there remain others accumulated in crevices in the tympanum or in the mastoid cells. (2) In patients suffering, or who have recently suffered, from inflammation of the middle ear, if symptoms of inflammatory irritation, or indications of pressure, stupor, headache, or giddiness arise, which suggest the presence of accumulated secretions in the tympanum or its communicating cavities. (3) In caries of the external auditory canal. The author has used his apparatus in such cases, introducing the point of the tube into the fistulous opening, and cleansing the part with a stream of water.—*Lond. Med. Record*, Jan. 15, 1880.

On the Operative Surgery of the Digestive Tract.

One of the cases related by **KRONLEIN** (*Berlin. Klin. Wochenschrift*, 1879, No. 34–35), is a successful case of gastrostomy. The stricture was due to annular cancer at about the middle of the œsophagus, in a labourer, aged 71. It was impassable even to fluid food. The incision was made parallel to the arches of the left ribs. The wound in the stomach was attached to the abdominal wound under antiseptic precautions, and the stomach was opened five days afterwards. From that time forward, nutrition was entirely carried on by the wound. The result was favourable, except that the patient suffered from very severe thirst which, however, could be fully satisfied by continuous chewing of tobacco. Two months later, the patient died from his cancer. The second case is a very interesting one. A child, six days old, had had no evacuation of the bowels since its birth. The anus was extremely narrow and terminated in a *cul-de-sac* at 2·5 centimetres high. After division of this in the antero-posterior median line, Kronlein endeavoured to reach the upper *cul-de-sac*. He only succeeded in opening the cavity of the abdomen, from which peritoneal exudation was freely evacuated. The upper *cul-de-sac*, however, was not reached. Laparotomy was then performed in the left groin, and a coil of the small intestine was drawn into the abdominal wound, fixed there, and opened. Contrary to expectation, the child lived and thrived under regular nourishment. Further search and attempts to sound the intestine below from the artificial anus failed. When, however, the child had grown to be seven months old, the upper end of the intestine ending in the *cul-de-sac* could be felt. The previous operation was again undertaken, and the upper *cul-de-sac* successfully united with the lower. At the close of the report a stricture existed at the place of union, but the larger part of the contents of the bowel were already evacuated by the natural anus.—*London Med. Record*, Jan. 15, 1880.

—

Gastrostomy for Strictures of the Œsophagus.

SKLEFFASSOWSKI (*Medizinski Westnik*, 1879, Nos. 21 and 24) relates in detail the case of a man, aged 38, who was suffering from complete cancerous obstruction of the œsophagus, and had for fifteen days been nourished by enemata, as at last not even water could pass the stricture. The operation was very successfully performed according to the accepted method, with strict antiseptic precautions, and the stomach opened by an incision passing from the ziphoid process, opposite the border of the eighth rib, to the left outwards for 2·4 inches. The opening in the stomach was stitched to the wounds in the walls of the abdomen by catgut ligatures: for a time the patient showed signs of favourable reaction. He was nourished by a little milk and sherry every three hours. But he fell off again in twenty hours, and died with symptoms of pneumonia. The left lung showed universal adhesions to the pleura, and bronchiectatic caverns. The aperture in the stomach was an inch below the cardiac entrance, and was adherent to the abdominal wall.—*London Med. Record*, Jan. 15, 1880.

—

Use of Cold Baths in Strangulated Hernia.

The use of cold in the treatment of strangulated hernia (*Wiener Medizinische Wochenschrift*, No. 26–27) has been often and much recommended for a long series of years, sometimes in the form of bladders of ice, sometimes in the form of cold compresses. These methods have, however, the disadvantage that they must be employed for a long time before any result follows; and if none follow, the favourable moment for operation may have been wasted in the unsuccessful attempt. Dr. HEIN observes that in four cases he had perseveringly employed cold applications to the tumour, without bringing about its reduction. On the other hand, he had in two cases favourable results with cold baths, by which he obtained an effect of cold upon the whole intestinal tract. In the first case the patient has had a warm bath ineffectually, and he then put him, sitting up, in a cold bath. The tumour returned of itself while the preparations were being made for the administration of chloroform. In the second case, one of scrotal hernia of the left side, eight hours incarcerated, he gave a bath for fifteen minutes at a temperature of 15 deg. Cent. (59 deg. Fahr.); the reparation was easily effected. Half an hour after the bath, the temperature was 36.4 deg. Cent. (97.5 deg. Fahr.) in the axilla. By this method a lowering of the whole temperature of the body is caused, and thereby contraction of the intestine in its whole length.—*London Med. Record*, Jan. 15, 1880.

—

Hydrocele with Cholesterin.

Prof. GOSSELIN reports (*Gaz. des Hôp.*, Jan. 22) the case of a man, aged forty-five years, the subject of a hydrocele, which had become painful in consequence of a slight injury received a few days ago. At first he was inclined to believe it a hæmatocele, owing to the difficulty he had in observing its transparency. This was at last accomplished by causing the patient to stand in front of a window through which the sun was shining. This difficulty might be due in part to a thickening of the coverings which was present, and to some swelling of the testis—a condition which Prof. Gosselin has found, without knowing why, to prevent seeing the transparency of effusion contained in the tunica vaginalis. About one hundred grammes of liquid were drawn off, and an injection of tincture of iodine (which Prof. Gosselin always dilutes with equal parts of water in subjects of forty or fifty years of age) thrown in. The colour of the liquid was much darker than usual, which explains the difficulty of the diagnosis; and even to the naked eye it was plain that the colour of the liquid was due to scales of cholesterin, with which it was loaded.—*Med. Times and Gaz.*, Jan. 31, 1880.

Analysis of Forty-five Cases of Excision of the Hip-joint.

At a late meeting of the Clinical Society of London Mr. CROFT, in continuation of the discussion which had originated at the preceding meeting (see *Medical News and Abstract* for February, p. 109), presented an analysis of forty-five cases of hip-joint excision, and remarked that his aim was to show that the operation may be made a successful one, and that greater success attends it when performed before abscesses have opened than later. In every case, before operation other means had been tried to arrest the progress of the disease. Ten cases had urgently needed speedy relief; thirty-five had been treated in the hospital for more extended periods, varying from one month to a year, and no case was operated upon until threatening abscess had manifested itself. Forty-five operations had been performed on fifty-four patients, one child having both joints excised; eighteen cases were cured; eleven were under treatment or observation; six patients had died from causes referable directly or indirectly to the operation; one child died of diphtheria; nine patients had been relieved by operation, but had died, some at long periods, some at shorter periods of time, from causes not attributable to the operation.

Tables giving full details were shown of the eighteen cases cured; twelve cases were exhibited. In fourteen there were movable joints affording flexion and extension, and nine enjoyed a considerable range of flexion, and could perform adduction and abduction to some extent. Four could stand alone firmly and steadily on the limb which had been operated upon. In each patient the limb was straight, without any permanent flexion on the pelvis. Each child stood erect, without any lordosis of the spine. In many the apparent shortening amounted to 3½ inches; but the femur on the diseased side was longer than was apparent, probably from the preservation of the trochanteric epiphysis and the subperiosteal operation (Sayre's) having been done. Of the eighteen cured cases, twelve were instances of chronic panarthritis, commencing, as he thought, in the synovial membrane; and six were instances of disease commencing in ostitis and ending in necrosis. In six, abscess had been incised and sinus had persisted; but in only two of the eighteen cases were the sinuses chronic in duration. In three, perforation of the acetabulum had taken place; whilst in the cases recorded in the list of deaths, chronic sinuses had been open in eleven, and perforation of the acetabulum had been found in five. Thirteen patients had been under treatment in the hospital for periods varying from two days to three months, four from three to six months, and one for eleven months, before operation was resorted to. The total number of the dead was sixteen, including four cases in which, with his present experience, he should not think excision to be the best treatment. The deaths were spread over fourteen years. Five deaths occurred from preventable disease—viz., one from diphtheria, three from pyæmia, and one from septicæmia. Six were attributable, directly or indirectly, to the operation—viz., one from septicæmia, three from pyæmia, one after suppuration in the bone following erysipelas (from shock of amputation at the hip ten months after excision), and one from thrombosis and asthenia sixteen days after excision. The causes of death in the nine other cases (not attributable to operation) were—one from tubercular meningitis, seven from tubercular disease with amyloid viscera, and one from tubercular phthisis and disease of other bones than the pelvis. He had followed up these cases in the interest of science, and though it seemed a large proportion of failures to cures, he ventured to think that, with improved diagnosis, by operating in good time, and by improved methods of operation and after-treatment, the proportion of failures will be considerably diminished.

After some further remarks, Mr. Croft said that several points might be taken up—*e. g.:* 1st. The advantages which he claimed for early, or relatively early, operation. 2d. Formulæ with respect to indications for operative interference. 3d. The mode of operating with reference to the periosteum, the leaving behind the epiphysis of the great trochanter, the line of section through the femur, free removal of parts, the line of incision through the soft parts, and the employment of antiseptics. 4th. The mode of after-treatment. 5th. The causes of failure in excision of the hip-joint. 6th. The comparison of limbs after excision with limbs of those who get well without operation. 7th. The time taken to get well by those not operated on compared with that taken by those successfully excised. As to the indications (No. 2) for operation, he said that when there was fluid in and about the joint and starting pains, an antiseptic incision should be made, to be followed by excision if pus associated with panarthritis (strumous disease) be present or if necrosis existed. The causes of failure (No. 5) were attributable to too late postponement of operation, not removing enough of the diseased parts, not allowing free exit for discharge, and not operating antiseptically. Excision of the hip was less successful than that of the knee, because the disease (*e. g.*, of acetabulum) could not be so thoroughly eradicated. Lastly, he advocated early operation (No. 1) because—(1) in cases of tubercular disease early complete excision affords the best prospect of cure; (2) immediate relief from pain of tension and spasmodic starting pains; (3) that it is made before muscles are much atrophied or altered by inflammatory products; (4) it shortens the duration of suffering and illness; (5) it enables the child to go about earlier than it could if left without interventive treatment; (6) it enables the surgeon to procure a painless, movable joint at the hips; (7) the shortening is only a trifle more than it is in the most favourable cases of anchylosis after destructive strumous disease of the joint.—*Lancet*, Dec. 27, 1879.

—

A New Method of Excising the Hip-joint.

At the same meeting Mr. R. W. PARKER subsequently read a paper on a New Method of Excising the Hip-joint, and made some general remarks on the pathology and treatment of the disease.

Mary Y——, aged eight years, admitted into the East London Children's Hospital, March, 1879. For two or three weeks previously she complained of acute pain in the knee and right leg generally, and was kept in bed; she had been feverish and lost appetite. On admission the upper part of the thigh and region of the hip were found much swollen and very painful. There was no appreciable fluctuation; the soft parts in the groin were slightly œdematous. No enlargement of glands. Passive movements caused considerable pain. An extension with weight was ordered. About a fortnight after her admission the following note of her condition was made, after being examined under chloroform: "Hip moves freely; no deep fluctuation detected; there is no grating in the joint. Knee-joint is much swollen. Temperature is high and variable." A low typhoid condition supervened, and for a time she was very ill. At the end of another month she had materially improved in her health, but her local trouble, on the other hand, continued to progress. An abscess now formed in the upper part of the thigh, which had to be opened. Eleven weeks after her admission she was again chloroformed, in order the better to examine the joint. Grating was found, and there was a free discharge of pus from the wound. An incision was made from the anterior superior spine of the ilium downwards, along the anterior border of the great trochanter, cutting between the sartorius and rectus muscles on the inner side, and the tensor and glutei on the outer side. The diseased bone was sawn off *in situ*, and then extracted with sequestrum forceps. While examining the acetabulum a portion of the epiphysis of the femur was found loose and necrosed. The child made a slow recovery. She can now get about, but there are still some open sinuses. Notes of some other cases of epiphysial necrosis were summarized.

The clinical features common to all, or the majority, were—progressive disease in spite of perfect rest in the recumbent position, with extension applied for an average period of three months; comparatively short duration of antecedent symptoms; the early formation of abscesses; young age of the patients. The pathological features were in all cases extensive caries of the neck of femur, epiphysial necrosis, destruction of capsule, free suppuration. The above case was selected because it illustrated three points on which the author would like to offer some observations—(1) As to the modes of operating generally in use; (2) as to the frequency and significance of epiphysial necrosis; and (3) as to the results of the disease with and without operation.

This new method of operation was proposed because it avoided the necessity of cutting across the large muscles attached to the great trochanter, which must necessarily be divided in order to expose the joints from behind. He advocated also the use of a keyhole saw in order to avoid injury to the periosteum and other structures, which forcibly wrenching out the head of the bone would probably occasion. And, without laying too much stress on the mode of incision, it was desirable that this question should be introduced, as the final results of the operation were yet far from satisfactory. He had found epiphysial necrosis in five out of eight cases. It was not until Mr. Hulke referred to it at a former meeting of the Society that he was aware that the condition was considered unusual. He believed, however, that it would be more frequently found if the operation were done in an earlier stage, for if caries of the neck of the femur were the common pathological condition of "hip disease," then this separation ough frequently to occur in consequence of the altered nutrition of the epiphysis. I was all very well to say that hip disease could be cured by rest and sea air. Th disease unfortunately occurred among those who could not have these advantages, and hence it assumed very unfavourable conditions. Neither did hospita treatment always avail, as his own cases showed. Hence the importance o deciding on the best operative treatment. He believed that the unsatisfactor results of incision were largely due to delay in carrying them out, for secondar diseases were induced, which quite precluded a satisfactory result. He though that an exploratory incision should be made into joints, when the disease continued to progress in spite of treatment during three months, and if signs o destruction of the joint occurred before this. The question of excision coul then be decided upon.

Mr. HOLMES said that he was much interested in this operation, and formerl had often performed it. He had not recently collected his cases, but a few years ago he had published his results in the work referred to by Mr. Croft. It was self-evident that the results of excision depend entirely upon the indications selected for the operation, and these indications must vary with the circumstances of each case. Excisions were less common in private practice, where more care was taken in the treatment of these cases from their commencement, and for this our hospital system was inadequate. Cases go from hospital to hospital, continuous rest is not obtained, and eventually they come to excision. He could not agree that the best treatment for abscesses in the neighbourhood of joints was to lay them open antiseptically. The indications were the other way, excision being deferred until actual evidence of destruction of cartilage was obtained. The result of the operation is in itself inferior to the result of natural cure. It is true that in the latter case there is much shortening, but the limb is stronger and more serviceable. He had never seen a patient who could *stand* on the leg after excision of the hip; for, as a general rule, there was undue mobility, and therefore instability—due, as could be seen on dissection, to lengthening and laxity of the ligaments. But patients with anchylosis after natural cure had strong and serviceable limbs, although they might be ungainly in their movements. But there were cases in which excision was called for to preserve life and health, and the efforts of surgeons should be to seek indications to discriminate these cases. It was necessary in such cases as one he had seen Mr. Pick deal with the other day, where there was acetabular disease; and in those which Mr. Parker had cited, where the epiphysis formed a sequestrum; or where a limited amount of disease existed in the neck of the femur which could not be got rid of without excision. There were those cases too, to which Mr. Parker had alluded, which went from bad to worse, in spite of treatment. He allowed that he used to think excision justified in cases where abscesses had formed and the joint was carious, but he now thought that some of these had a chance of cure if free drainage were encouraged. The rate of mortality should not influence the question; for obviously if the cases were only operated on in a very advanced stage the mortality would be high, and every recovery in such circumstances a clear gain. If the operation were done early, the deaths would be fewer, but the gain less. He congratulated Mr. Croft on his success, but took a little exception to the freedom of his measures. Excision of the hip would never be so successful as that of the knee, owing to the difficulty of removing all the disease—*e. g.*, of the acetabulum. He had no experience of antiseptics in this operation, but his results had been much the same as those of Mr. Croft—namely, that one-third died, one-third were cured, and one-third remained in a doubtful condition.

Mr. Hulke said they were indebted to Mr. Croft for his comprehensive analysis, viewing, as he had, the cases from so many sides. At the close of the last meeting they had been under the impression that the rate of mortality in Mr. Croft's cases, in consequence of the operation, had been as high as one-third of all the cases; and his own (Mr. Hulke's) experience, although much more limited, was so different that he ventured to express surprise at the figures. Mr. Croft had, however, now clearly shown that in many of these cases the deaths were not due to the operation itself. In his own hospital practice (for, like Mr. Holmes, he had never had occasion to perform excision in private practice) he found that out of 313 cases of diseased joints in the last ten years, there were 86 examples of hip-joint disease, about 6 of which perhaps were not strictly "morbus coxæ." In these 80 cases he had performed excision 16 times—*i. e.*, 1 in 5; and in only one case could death be fairly attributed to the operation, a proportion probably similar to most others. As to the indications for operating, he agreed with Mr. Holmes. For even in some of the cases shown by Mr. Croft he doubted whether incision had always been called for. For instance, there was one case which had been operated on after a month's illness, and no evidence of a previously open abscess existed. A more valuable indication than the local evidence was the manner in which the disease was telling on the general constitution. If, in an advanced stage of local disease, the patient be yet in fair health, excision was called for; but if he were losing ground in the earlier stages he would leave him alone. As to the methods, he preferred the external incision, as affording a dependent opening for free drainage; and he always washed out the cavity with chloride of zinc, according to the plan introduced by the late Campbell de Morgan. He claimed to be antiseptic in his practice, always endeavouring to prevent putrefaction; but if by "antiseptics" Mr. Croft meant Listerism, he had never adopted that. Mr. Hulke concluded by drawing attention to a form of splint which he used in these cases. It was applied to the other side, and allowed the joint operated on to be freely exposed.

Professor LISTER was much pleased to hear Mr. Hulke's remarks upon the use of chloride of zinc. Ever since Mr. de Morgan had drawn attention to it he had himself employed it, for it has the remarkable property of preventing putrefaction for two or more days in spite of the presence of septic elements. Whenever, then, putrefaction is already present this salt was of great benefit, and he was sure that he had seen cases which would have died had it not been used. He could understand Mr. Hulke's results since he used that combined with free drainage. He had never seen a case in which amputation of the hip was called for in preference to excision. Since seeing Professor Sayre illustrate his method at the Philadelphia Congress he had followed that plan, which involved only a limited incision, did not require the ligature of any vessel, and gave free access to the joint, whilst the subperiosteal section was of great advantage. The importance of a freely dependent opening was in favour of the posterior incision rather than the ingenious plan introduced by Mr. Parker. The last case he had operated on was in a young lady twenty-five years of age, the subject of hip-disease from early childhood. The limb was flexed, and riddled with profusely discharging sinuses. He excised after Sayre's method, broke through the anchylosis, and found the acetabulum to be perforated. All the diseased bone being cleared away, chloride of zinc was applied, and now three weeks after, there was far less discharge than at any time before the operation. That was an instance of excision in private practice, and it would have been wrong to have refused the patient the benefit of it. He could not concur in the view taken by Mr. Holmes as to treatment of abscesses in the hip, where the skin is unbroken. When assured that the abscess communicates with the joint we are bound to open that abscess using such measures as we can to prevent putrefaction. At this point of surgical history it was not enough to treat such abscesses by "free incisions and washing out." To his mind it would be monstrous and horrible to open such abscesses without antiseptic precautions. He could never forget the feeling he experienced in the first case he so dealt with from a knowledge that the results would be different from those with which hitherto all had been so familiar. He would mention three cases he had had at King's College Hospital of abscesses connected with the hip in adults. If treated by simple incision, frequent washing out, and free drainage, the result might have been different from what it was. One was a young woman in whom the inflammation was attributable to sleeping in a damp bed; the second was a man in whom it had followed acute rheumatism; and the third was in an old woman, also rheumatic in origin. In each case the abscess was opened and treated antiseptically; no fever followed, and no shortening of the limb. No one could imagine the satisfaction at such issues; for had these cases been treated in the ordinary way, probably all three patients would have died.

In strumous cases—where shortening exists, with or without perceptible grat- ing—he should open the abscesses antiseptically, and often more useful limbs are thus preserved than by excision; and even in advanced cases, for it was surprising what may be done by repair. In one case he had at Edinburgh, treated on this plan, he removed much carious substance, and the case went on so well that e thought it would not come to excision. No pus was formed, and the patient as almost well, only a small sinus oozing serum remaining when the antiseptic essings were given up. Suppuration followed, and excision had to be resorted . He therefore urged strongly that if they wished to do full justice to their ients they ought to use antiseptic measures when the skin was unbroken. ere should be no difference in their practice of hospital patients and private cases. hospital cases were to be deprived of all the benefits they could bring to them, hospital accommodation was shamefully and disgracefully inadequate.

Mr. **Morrant Baker** had performed excision of the hip in twenty-four cases at Bartholomew's and the Evelina Hospitals, two of which only had died from any e attributable to the operation. There was no reason why this operation ald be followed by exceptional mortality, when done with sufficient care. It unnecessary to push the head of the bone out of the wound before sawing it ; there was comparatively no shock, and he did not think the risks greater those in the removal of a sequestrum from the tibia. His practice was ys to cut through the neck of the femur and leave the trochanter. It was necessary to remove all the diseased bone; were this done, the whole shaft ht sometimes require removal. Removal of the trochanter left a weaker b. A perfect result was not always obtainable. Many of the subjects of bus coxæ were tuberculous or the victims of amyloid disease, and all the ope- on could do was to improve the condition and prolong life. He concurred Messrs. Holmes and Hulke that very much depended on the selection of fit es; and no definite signs or general rules could be laid down for this. They t depend on their individual judgment and experience, and, unless this was e, cases might be operated on early which would have got well if left alone. is experience it was not rare to find the head of the bone, detached as a seques- n, loose in the acetabular cavity; in eleven out of twenty-four instances this been the case, and that was a strong reason for performing excision in such s; for were it not done the dead bone would become locked up in the cavity be a constant source of irritation. He had brought one of his cases—a boy whom the head of the bone was thus detached, and in this case he also re- d a part of the acetabular margin, which was also quite loose. Amyloid e was not, in every case, a bar to operation. A lad of fourteen, in St. olomew's Hospital last year, gradually developed amyloid disease; his liver ged and albuminuria appeared. Excision was performed, and from that e the signs of amyloid disease had steadily diminished. Had not excision practised he doubted if the boy would now be alive. Of course if it were ed that cases did as well without interference he would cease to excise. But ing as he did how many of these cases, if not interfered with, went on from to worse, how amyloid disease developed, and it was obvious that death would the only termination—he could not hesitate performing an operation which was ently merely a matter of the removal of dead bone. They were much in- ed to Mr. Croft for raising the question, and he believed that the result would an earlier resort to excision than now prevailed.

Mr. J. **Wood** had performed excision of the hip in all classes of cases, some here there were no open abscesses, some where amyloid disease was present;

and he had come to the conclusion that the operation was one which had bee abused. For there were cases which could be treated by extension, etc., and such should not be operated on. The tendency of modern surgery seemed to b rather meddlesome. He believed that if cases were seen early enough an treated scientifically there would be less need for excision. It was significa how rarely excision was necessary in the upper and middle classes, showing th neglect of treatment by rest among the poorer classes was a prime reason for th cases becoming so severe as to demand excision. Excision of the hip was not formidable operation, and he had frequently witnessed the remarkable fall i temperature and improvement that followed its performance. His method w similar to that mentioned by Mr. Baker; and in children he dissected off the ca of cartilage from the trochanter. Attention to drainage was of prime impor ance. In one case, where a large unopened abscess extended half way dow the thigh, and in a very emaciated subject, he had opened the abscess (not an septically), injected chloride of zinc, and practised free drainage. When t abscess cavity had contracted, he performed an exploratory operation (the ca was one where the acetabular cavity had travelled upwards), and, finding t head of the bone to be bare, he excised this, as well as a portion of necrosed ac tabulum. He had removed considerable portions of pelvic bones with securit As to the time for operative interference, he agreed with Mr. Baker that no o symptom alone should be relied on. But when, on exploration, dead bone felt, this should be removed. This could generally be done by opening up t sinus in the interior of the thigh, and reaching the joint beneath the tensor vagi muscles, and detaching the muscles attached to the trochanter. He agreed a the impropriety of forcibly pushing the head of the bone through the woun By the use of a special saw the neck could be divided above the small trochant and removal effected after having previously dissected off the periosteum fr the great trochanter of an adult, or detaching the cartilage of a child. He wo operate in these cases, but not in those where nature was sufficient to effect cure. He perfectly agreed with Mr. Lister as to giving poor and rich alike all t advantages derived from improved skill, and, although his practice had been s cessful, yet if an iota of advantage were to be gained by using Listerian prec tions, he would always adopt them.

Mr. MacCarmac pointed out that the subject involved the two questions—(as a saving of life, (2) as preserving a useful limb. The mortality in Mr. Cro cases was not large, seeing the condition and stage at which some of the patie were operated on. He had himself had eighteen cases, with two deaths; a doubtless had he traced their subsequent history as diligently as Mr. Croft h done, he would have found that many had died at later periods. The fact t many of these cases began in inflammation, leading to necrosis, was a strong rea for early operation. Further, there was good reason to believe that a large p portion were of tubercular nature. Koenig, of Göttingen, found tubercular d ease of the bone to exist in sixty-seven out of seventy-one cases, and that wa strong point in favour of the early removal of the primary focus. The mortal after excision of the knee used to be very high, but now, since the operation performed in less advanced cases, the results were far more satisfactory. Wi out wishing to lay too little stress upon reasons for delay, he yet held that in m cases excision should be done early if good success was to be had.

Mr. Howse congratulated Mr. Baker on his profession of faith in the va of excision of the hip. It was of the more consequence, because it came fro surgeon who had, not very long ago, entertained different opinions, and who not easily convinced. As his colleague at the Evelina Hospital for Sick Child he had seen nearly all the cases operated on, and he could assure the meet there was not one in which the operation had been performed in an early stage of the disease, or for other than the most grave forms of the affection. If then such results were obtainable by operating upon the worst cases, what might be expected when the affection was operated upon in an earlier stage? For his own part, he believed excision of the hip one of the best abused operations of surgery. It was so because it was looked upon as a *dernier ressort* in hip disease, and hence was made use of at a stage of the affection, often when lardaceous or miliary berculosis was impending, when it could be of very little use in saving the paent. In his own experience (and he had performed a very large number of ese operations) excision of the hip-joint was an operation involving very little nger to the patient. The bleeding was small, and when performed antiseptilly the shock was slight, and the general constitutional disturbance very little. e believed, therefore, the operation might with advantage be used at a very ch earlier stage than at present. Whatever might be thought of the advisaty of excisions when the joint cavity was simply distended with pus, before e stage of cartilage destruction, he himself entertained no doubt of the benefit be obtained from this operation when grating was perceptible in the articulan. And he did so on account of the difficulties in such cases of diagnosis of e exact pathological state of the bone. It was true, as Mr. Holmes said, that e of the cases where grating was perceptible did well with simple incisions, t, and extension, but it was only a small percentage of such cases. If the ne was healthy the case might do well by such treatment, but the comparaely small proportion of cases in which the bone remained healthy was shown Mr. Baker's patients by the number of times in which he removed sequestra m the joint. Granted, then, a case of grating hip-joint, it was next to imsible by physical signs to determine, short of excision, whether the bone was a healthy state or not. And as the removal of the head of the bone added y little, if any, to the risks of the operation, he preferred to complete it in s way. Indeed, he would be prepared to go much further than this, and say t excision was justifiable before the stage of grating was reached, when, in t, the joint was distended with pus, and showed progressive signs of getting e after treatment by rest and medicinal means. With a patient lying in d and emaciating from pain and hectic, excision was often the only successful ans of arresting the disease.

As regards the method of operation, he preferred to remove the trochanter jor. He regarded free drainage after the operation as of primary importance, the presence of the trochanter impeded this. If the trochanter were not away the muscular attachments to it were also generally not severed, and e muscles, contracting after the operation, drew up the limb and caused the hanter to act as a kind of shield over the cavity of the acetabulum. If, subeatly, there were any sequestra to come away from the bone, they tended be retained longer in this way than they would be if the trochanter were reved. As far as the treatment of carious acetabulum was concerned, he did t believe in the value of gouging it away. The bone was often so softened in h cases, and it was so difficult to determine at the time of the operation what e was recoverable and what not, that gouging might be carried much too far, d then the pelvic fascia opened up, with considerable risk subsequently of pelic abscess. His own rule of late had been, that if a sequestrum had existed se to remove it, but otherwise to leave the acetabulum alone. He believed t better results would be obtained in this way than by too much meddling ith it.

Mr. Croft, in reply, said that Mr. Holmes's statement that a limb after natural re was superior to a limb after excision, appeared a formidable fact; but that should not weigh in deciding as to intervention. Mr. Holmes confessed his in ability to give any indications of the cases where there was no necrosis and thos in which there was necrosis, the crucial point in the matter. Where there wa tubercular disease, as Mr. MacCormac pointed out, it was most important to ex tirpate the focus of possible inoculation. The specimens on the table would sho that in not one of his cases was the operation uncalled for, and until any indica tions better than those he had followed could be furnished he would not yield hi point. He had given his facts, and was prepared to stand by them. No suc indications had been given by those who had spoken. The case of the chil criticized by Mr. Hulke was one of acute necrosis, and no surgeon would refra from interference in such a case when the head of the bone was already dislocat and the child was intensely suffering. He had adopted Sayre's method, using longitudinal incision in the majority; a small number he had done by a Y-shape incision, and he preserved the great trochanter or its periosteum, in order th firmer union might result, avoiding division of muscles from the trochanter. H doubted, after all, whether much difference of opinion really existed on the ques tion; but he adhered to his opinion that the presence of pus in the joint points to advancing disorganization, and that in all such cases the surgeon should inci antiseptically, and if, on exploring, necrosis be found, he should then excise th head without delay.—*Lancet*, Dec. 27, 1879.

Midwifery and Gynæcology.

Double Uterus with Double Conception.

Dr. M. A. Cachot reports (*Pacific Med. and Surg. Journ.*, Jan. 1880) a case of a lady, now aged 35 years, who was under his care formerly for eig years. He first treated her for typhoid fever, in St. Mary's Hospital, and afte wards for irregular and painful menstruation. After the use of a great varie of therapeutic means, her health was much improved. But the menstrual fl never could be regulated. It invariably appeared twice a month, a few da intervening between the two periods. The former of the two periods was ve painful, the succeeding one perfectly painless. This was prior to her marriag After her marriage she left the city, and when he next saw her, it was on accou of her returning to the city to be confined.

In due time labour set in with great violence, and was very tedious, lasti twenty-three hours. The os uteri continued for a long time very hard and rigi and the uterus appeared abnormal in form, as if containing an intra-mural tumo of the size of a large egg. Labour terminated favourably with the birth of living child, which weighed seven and three-quarter pounds. Spontaneous e pulsion of the placenta followed, it being of the normal size. Two hours aft delivery, hemorrhage came on, but was controlled by ergot and ice. The patie now improved rapidly, but three days afterward there was some return of hemo rhage, with pains simulating labour. On vaginal examination, Dr. Cachot fou the uterus perfectly contracted, and no blood flowing from it. On searching f the source of the blood, he found on the left side of the uterus, immediately und the supposed tumour, another os dilated to the size of a half-dollar, and a fœt presenting, which was extracted without difficulty. According to its appearanc it was about three months old, and very much decomposed, its death having tak place during the former labour, or some time before. After the removal of th fœtus, hemorrhage ceased immediately, and recovery was very rapid, the patient being up in twelve days.

In the sixth month following, menstruation returned, and she has since given birth to another child, without difficulty, and without the aid of a physician.

A Case of Spontaneous Version.

M. **Tédenat** records (*Lyon Médical*, Dec. 7, 1879) the case of a primapara n whom pains began in the evening; next morning at 2 A. M. membranes ptured; at 8 P. M. she was admitted into the maternity, examined, and the oulder found to be presenting, the back anterior and the head in the right iliac ssa; the os being as big as a florin. She was examined also by the chief suron of the maternity, and preparations made for turning. While things were ing got ready, a sustained powerful uterine contraction affected the left half of e uterus, the right remaining flaccid; the head therefore could be easily made t through the abdominal parietes, and felt to be slightly raised. Then followed other similar contraction, but passing more to the right; with this the upward vement of the head was more pronounced, and the vaginal finger, instead of ching the shoulder, came upon the axilla. After six or seven more contracns, the transverse presentation was changed into one of the breech, in the left lique diameter, dorso-anterior. An hour after, the labour spontaneously ternated in the birth of a living child. It was noticed that most of the uterine ntractions began at the left and passed to the right side of the uterus. The centa was retained, and on examination found to be encysted in the right horn f the uterus, which was incompletely bicorned, a median spur forming a projecon from the fundus of five centimetres in height, and prolonged as a distinct phé along the posterior wall. Commenting on the case, M. Tédenat points t that spontaneous changes of the presentation during the last few weeks of station are not infrequent. Schröder found such changes in six out of 214 es, and the author in five out of sixty. The size of the child, the length of e cord, the dimensions of the pelvis, and the quantity of liquor amnii he thinks bably the factors which determine the occurrence of such mutations. He ds that most authors attribute to partial contraction of the uterus a large *rôle* the production of these alterations. In his own case, the right and left parts the uterus acted as would have done the hands of an accoucheur performing rnal version. He agrees with Pollaillon in thinking that a bicorned condin of the uterus predisposes to transverse presentations, the septum preventing long axis of the fœtus from corresponding to that of the uterus.—*Obstetrical nal of Great Britain*, Jan. 15, 1880.

Hot Water for the Induction of Premature Labour.

Dr. **Benicker** related at the Berlin Obstetrical Society (*Berlin Klin. Woch.*, r. 29) a case of dropsy of the amnion, showing the advantage of inducing preture labour by irrigating the vagina with water at a temperature of 40° R. 22° Fahr.), to which some carbolic acid had been added. Two injections in the ning brought on pains which increased during the night, and after two other intions in the morning the cervix became well dilated. Dr. Benicker recommends s procedure as an energetic means of exciting labour without injury to mother child. Its effects will vary according to the degree of excitability of the uterine res in different women. Mr. Möricke related a case in which he had in vain empted to induce premature labour by injecting first pilocarpin, and afterwards t water, which was employed five times. He eventually succeeded by means f a bougie. Dr. Runge, who had already published a successful case, cited another in which the injection failed. All trials that have been made show the harmlessness of the procedure for the child. Dr. Veit referred to a case in which excessive rigidity of the soft parts was overcome by the injections. Dr. Wegscheider stated that many years since hot-water injections were employed in Berlin, but were given up on account of the bad effects they were supposed to have on the child.—*Med. Times and Gazette*, Jan. 31, 1880.

A Case of Sudden Death of the Mother at the End of Pregnancy, with Post-mortem Section and a Living Child.

Dr. STORCH of Copenhagen records in the *Centralblat für Gynäkologie*, No. 25, 1879, the case of a patient who suffered for some time from albuminuria and œdema of the lower extremities, was 30 years old, a primipara, and had several years ago suffered from rheumatic fever. Her circumstances were comfortable. Towards the end of her pregnancy the patient complained of breathlessness and general disturbance, with much restlessness. The only indication of cardiac disease was a weak systolic murmur audible over the aortic valves; there was much hydramnios. The patient was suddenly seized with a fit of coughing and intense dyspnœa, during which she sprang out of bed, and seated herself in a chair in a condition of intense cyanosis. An attempt was made to give relief by venesection, but no blood would come. A few seconds afterwards she died. About 8–10 minutes after death Cæsarean section was performed, and a well-developed male child removed. The entire operation lasted about half a minute. The child was pale and relaxed. Dr. Storch, however, perceived a feeble and slow pulsation in the cord, about 70 beats in the minute. The cord was speedily tied, and persistent efforts at resuscitation continued for an hour and a half, the methods employed being the rhythmical blowing of air into the chest through a silver catheter, alternating with Schulze's method of artificial respiration. These were followed by complete success, although a full half-hour passed before the child made its first feeble spontaneous inspiration.—*Edinburgh Med. Journal*, Jan. 1880.

—

Ovarian Pain during Pregnancy.

Dr. CHAIGNOT arrives, after the study of many cases, at the following conclusions. Abdominal palpation practised at the end of pregnancy may, in a certain number of women, produce a sudden and sometimes very sharp pain near the sides of the uterus. This pain, in addition to its being provoked, is always of short duration, and clearly localized. If the conditions of the examinations remain the same, the physician can always reproduce them at will. It only appears when a small movable tumour of ovoid form is pressed against the uterus. He believes with Budin that the above-named small tumour is nothing else but the ovary, which is painful when compressed. It appears to be necessary for the production of this pain that there must be a resisting surface behind the ovarian tumour, such as the dorsal surface of the fœtus, or the contracted uterus. The ovarian pain appears most frequently on the left. This is due to the inclination and twisting of the uterus, which turns its left border forwards and produces the frequency of occipito-iliac left anterior positions. The most frequent spot for the pain is near a line drawn from the anterior superior spine of the ilium to the umbilicus, generally a few centimetres above it, during the last month of gestation. The average distances are from 8 to 10 centimetres from the anterior superior iliac spine; from 17 to 19 centimetres from the umbilicus, and 6 centimetres behind the projection formed by the round ligament. His observations do not enable him to affirm the existence of spontaneous ovarian pain during pregnancy. He believes it to be possible, but it is necessary that favourable conditions be present. After labour, it is possible in some cases to reproduce the ovarian pain. It is then beneath a line drawn from the anterior superior iliac spine to the umbilicus.—*London Med. Record*, Jan. 15, 1880.

Utero-Inguinal Hernia: Extirpation of Uterus and Left Ovary.

G. **Leopold** relates in the *Archiv für Gynäcologie*, vol. xiv., a case of which the following abstract is given in the *Centralblatt für die Med. Wissenschaften* for October 11th. The subject, a well-developed woman aged 28, had experienced menstrual molimina since the age of fourteen; there was no discharge of blood, but she had for several days severe pain in the left groin. In this situation, an irregular tumour of the size of a plum swelled up considerably at each catamenial period, and was again diminished in the intervals. As her general health was much impaired, and eight years of married life had remained unfruitful, Dr. Leopold was consulted. He found in the left external inguinal fossa a tumour as large as half a hen's egg; this he took to be an abnormally placed ovary, from the median pole of which a strong cord could be traced as far as the left labium majus. On the right side, behind the horizontal ramus of the os pubis, a small cylindrical body could be felt. The vagina was a small *cul-de-sac* 1½ inch deep; nothing could be felt in it but the bladder and rectum. At the next menstrual period, the face was noted to be bloated and of a dark brown-red colour; there were also epistaxis, convulsions, and rigors; and the tumour in the inguinal canal enlarged. Dr. Leopold now removed the tumour. It was found to be the upper section of a small uterus, traces of which disappeared in the form of a scarcely perceptible cord. The ovary, the Fallopian tube, and the small uterus were removed; the pedicle was securely ligatured and returned; and the wound closed. The patient made a good recovery, and had no return of the menstrual molimen. In the removed uterus was a cavity as large as a pea, filled with mucus, and having a smooth mucous membrane and a delicate vascular network. Blood had apparently not been effused into the cavity. Dr. Leopold regards the case as one of imperfect development of the Müllerian ducts, the left one of which was drawn into the inguinal canal. The ovary that was removed showed signs of active formation of follicles; the uterine horn always swelled considerably; and nevertheless there was no discharge into the uterine cavity.—*British Med. Journal*, Jan. 3, 1880.

The Pain in Pelvic Cancer, and its Relief by Morphia.

At a recent meeting of the Obstetrical Society of London, Mr. **Champneys** read a paper on this subject. The larger part of his communication consisted of a clinical study of fifty cases in the wards of St. Bartholomew's Hospital, and was illustrated by fourteen tables, dealing with the ages of the patients, the first symptoms noticed, the seat of pain, its locality, the date of its commencement, its quality, amount of intensity, and the relation of pain to hemorrhage. The analysis showed some points of departure from what have been considered established facts; for instance, as many of the patients were from thirty to forty years of age as were from forty to fifty; and, again, pain rather than hemorrhage was the first symptom noticed. On these the author remarks that his cases were only fifty, and can therefore not overthrow Dr. West's larger number of 166, but suggests that as this part of the question cannot be founded on objective facts, but must depend on the patient's memory, which memory might be supposed to retain hemorrhage rather than pain, it may be supposed that pain, as a first symptom, may occur oftener than is usually imagined.

It was shown that cancer may be painless at almost every stage, but it was remarked that of the author's cases none were painless in which hemorrhage was absent. The seat of pain was carefully ascertained by making the patient lay her hand or finger on the spot. The localities were most various, the region of prevalence of uterine pains being seen, however, to be mainly bounded by the line of the sacrum above and of the knee below. It is remarkable that the pains were six times as common on the left as on the right side, which cannot depend on the locality of the disease, but must depend on the difference with regard to sensation between the two halves of the body, a difference seen also in the common left-sided pain of females and the preponderance of left-sided hemianæsthesia; "Man is not an absolutely bilaterally symmetrical animal." Aching of the whole front of the thighs and pain transfixing the body are believed by the author to be at least uncommon except in cancer. Backache amounted to 24 per cent., pain in lower abdomen to 14 per cent., pain in the groins to 18 per cent., of all pains.

It was shown that no relation existed between intensity of pain and duration of disease. Thirty cases showed the pain to be worse post-meridian than ante-meridian. The author suggested a connection between pain worse at night and pain relieved by bleeding as possibly depending on the increase or diminution of vascular tension in the diseased tissues, which is illustrated by the nocturnal tightening of bandages, and he remarked that in all his painless cases there was bleeding. Three remarkable cases are given at length of nervous affection, in one of which there was paroxysmal nocturnal motor and vaso-motor disturbance of one, then of both legs, depending probably on irritation reflected at the spinal cord. Of the methods of administering morphia, the hypodermic injection was shown to be by far the most, and the suppository the least, effectual.—*Lancet*, Jan. 24, 1880.

Medical Jurisprudence and Toxicology.

Poisoning by Aniline.

M. Leloir recently made a communication to the Paris *Société de Biologie* on the phenomena of poisoning which had supervened in patients affected with psoriasis, to a limited portion of whose skin bandages saturated with a solution containing chlorhydrate of aniline had been applied. These patients had nausea, algidity, cyanosis, cramps, dyspnœa, and sleepiness; the urine contained fuchsine. M. Leloir had studied aniline poisoning experimentally. The phenomena observed in dogs, into the veins of which thirty grains of aniline were injected, were perfectly analogous to those found in man. The urine was scanty, and contained fuchsine; the saliva, on the contrary, was rather abundant, but did not contain either fuchsine or aniline; the blood was of a brownish tint, the corpuscles under microscopic examination appeared healthy. Nevertheless, blood-lesions seemed to be the cause of the symptoms noted. In several cases, there were epileptiform convulsions, which were not present in cases where the animal was killed by a series of weak injections; death then supervened by cold. M. Quinquaud has made experiments on the same subject, and has also noted, besides the appearances observed by M. Leloir, a diminution of hæmaglobin, and a remarkable incapacity of the undestroyed hæmaglobin to absorb oxygen. M. Laborde reminded the Society that the workmen in aniline works are subject to epileptiform convulsions.—*British Med. Journal*, Jan. 31, 1880.

MEDICAL NEWS.

A LEAVE-TAKING.

With this number my direct relations cease with the readers of the periodicals which have so long borne my imprint and that of my predecessors. It would be futile to assert that I can without regret look upon the sundering of a personal connection which has existed now for thirty-seven years; but that regret is lightened by the fact that I relinquish the business management of the "Journal" and the "News" at a time when they are enjoying to the utmost the favour of the profession, and that in introducing as my successors the firm of Henry C. Lea's Son & Co., I feel that the responsibilities which I am putting off devolve upon those fully equal to them.

In a country so young as this, it does not often come to pass that a business house passes through an unbroken line of descent to the fourth generation. Yet such is the case with the one, founded well-nigh a century ago by Mathew Carey, in which I have so long formed a part, and which I hand down, I trust, with its honourable traditions of usefulness and fair dealing unimpaired. For the new firm I can ask nothing more than a continuance of the very cordial relations which have during this long period been maintained between their predecessors and the profession.

Henry C. Lea.

March 1, 1880.

The Library of the New York Academy of Medicine.—We are happy to learn that the negotiations which have been for some time pending for the fusion of the libraries of the New York Academy of Medicine and the New York Journal Association have been at last successfully brought to a close by the Journal Association being merged into the Academy. The library of the Academy now numbers ten thousand volumes, and three thousand have been received from the Journal Association, and it is stated that another library of one thousand volumes will be soon added, and that the Library Committee expects that, before the close of this year, the total number of volumes will reach twenty thousand. It is the intention of the Academy to keep the library open in the evening and to establish a circulating department for medical journals on the plan heretofore practised by the Journal Association.

The existence of small medical libraries scattered here and there over a large city is a great misfortune to those who use them. The pride felt by the members of each society in its possessing a library is vastly more than counterbalanced by the great inconvenience which results to them from the uncertainty where to find any particular book which happens to be needed, or from having to consult several libraries widely distant, with the consequent loss of time, in the prosecution of a study upon any particular subject. A medical society's library exists for the benefit of the whole profession in its locality and should be so conducted; and it is much wiser for the individual members of the profession, rather than waste their money in the administration of, and in necessarily duplicating books for, several small libraries, to economize their resources and unite their means in building up one principal library to which they can resort with the knowledge that whatever wealth of literature exists among them is there to be found.

It is for these reasons that we think the Academy of Medicine and the profession of New York are to be congratulated on the absorption of the library of the Journal Association, and we are sure that the first to recognize the wisdom of this step will be the members of the Journal Association itself.

—

Wickersheimer's Preservative Fluid.—The *Berliner Klin. Wochenschrift*, No. 44, 1879, publishes an official memorandum by the German Minister of Education, etc., with reference to a new preparation for preserving dead bodies, animals, or plants, which has been invented by Herr Wickersheimer, of the University Museum at Berlin. The formula had been patented, but by arrangement with the Government the patent has been annulled within the limits of the German Empire. The composition of the fluid is as follows: Alum 100 grammes, common salt 25 gr., saltpetre 12 gr., potash 60 gr., and arsenious acid 10 gr., are to be dissolved in 3000 gr. boiling water. On cooling, the liquid is to be filtered. To every two and a half litres, supposing a large quantity to be prepared at once, a litre of glycerine and 250 ccm. of methylic alcohol are to be added. Herr Wickersheimer states that the bodies of animals or men preserved with this fluid retain their form, colour, and pliability completely. After several years the muscles look as fresh on section as if they belonged to a recent corpse. For embalming purposes the body is first injected with the fluid, in the proportion of one litre and a half for a child of two years, and of five litres for an adult. It then is immersed in a bath of the fluid for several days, after which it is rubbed dry, swathed in bandages wetted with the fluid, and preserved in an air-tight case. For bodies which are to be dissected, the injection alone suffices. Small vertebrates and invertebrates can be kept simply immersed in the fluid, or if wanted in the dry state may be in it six to twelve days, and then be taken out and dried in the open air. Hollow organs, such as the lungs and intestinal tract, are best injected with it before immersion. The process seems to have the recommendation of simplicity and cheapness, as well as that of its preserving the natural colour and the pliability of the objects treated by it. It is certain that its merits must have been well tested before receiving the *imprimatur* of the German Government.—*Med. Times and Gazette*, Dec. 6, 1879.

At a recent meeting of the Academy of Natural Sciences of Philadelphia, Dr. Leidy stated that this liquid was almost identically the same as that which had been used at the University of Pennsylvania for years, by the late Dr. Horner and himself, and it was simply a modification of the fluid used in the West for the preservation of hams, arsenious acid being substituted for the starch of that mixture.

—

Massachusetts State Board of Health.—Dr. Henry I. Bowditch has tendered to the Governor his resignation as a member of the amalgamated Board of Health, Lunacy, and Charity, owing to the trebling of his duties, and the impossibility of his attending to them without serious injury to his private business. Dr. Bowditch has been Chairman of the State Board of Health since its organization in 1869, and his resignation is a serious loss to the sanitary interests of the State, which will be felt far beyond its own confines.

—

Medical Society of the State of New York.—The seventy-fourth annual meeting of this Society was held at Albany on the 3d, 4th, and 5th of February, under the Presidency of Dr. Henry D. Didama, of Syracuse. The attendance of delegates was large, and many very interesting papers were read.

The following officers were elected to serve for the ensuing year: President, Wm. H. Bailey, M.D., of Albany; Vice-President, Dr. A. Jacobi, of New York; Secretary, Dr. Wm. Manlius Smith, of Manlius; Treasurer, Dr. C. H. Porter, of Albany. The next meeting will be held at Albany on the first Tuesday in February, 1881.

—

Iowa State Medical Society.—The twenty-eighth annual meeting of this Society was held at Des Moines, January 27th, 28th, and 29th. Dr. G. P. Hanawalt, of Des Moines, President, in the chair. The following officers were elected for the ensuing year: President, S. B. Chase, M.D., of Osage. Vice-Presidents, Drs. T. J. Caldwell, of Adel, and L. J. Alleman, of Boone. Secretary, Dr. J. T. Kennedy, of Des Moines. The next meeting will be held at Dubuque.

—

The Abuse of Indiscriminate Medical Relief.

A conference between the Medical Charities of this city and the Philadelphia Society for Organizing Charity was held last month with a view to the development of a plan by which the abuse of the existing indiscriminate medical relief may be abated. Dr. H. Lenox Hodge, on behalf of the Committee of the Philadelphia Society for Organizing Charity, presented the following recommendations:—

First. That all applications for relief shall be made in the first instance at the offices of the Medical Charities.

Second. That applicants with families in receipt of $9 a week or more, unmarried persons receiving $6 or more, persons living out at service, are able to employ a physician, and should be refused treatment; and that applicants should be so advised through the cards of the Medical Charities, as well as by notices placed on the doors of the service rooms.

Third. That applicants who may be admitted to treatment shall be required to pay for their medicine, or to deposit ten cents at each visit in a box provided for the purpose, unless exempted through procurement of a certificate of the ward superintendent of the Society for Organizing Charity, on which the words "unable to pay" shall be noted. This condition should also be placed on the cards and on the notices on the doors of the service rooms.

Dr. Frederick R. Sturgis, of New York, by special invitation, detailed the workings of the fee system in the dispensaries of that city. This system was adopted in the New York Dispensary in 1876, and the income to the Dispensary from this source in that year was $852.44. The next year the machinery began to work smoother; 95 per cent. of the men, and 75 per cent. of the women, against 50 per cent. of them the previous year, were found able to pay the small sums demanded, and $3462.29 was received that year.

The meeting adopted the following resolutions:—

Resolved, That efforts should be made to prevent the pauperizing and enervating influences of undue and indiscriminate medical relief.

Resolved, That measures be taken to arrange the dispensary system so as to cover the whole city, in order to afford relief to the poor in every part at an office near to their homes, and to prevent overlapping in the treatment of cases.

Resolved, That a committee be appointed to carry into effect the plan which has been proposed to-night, or such modification of it as they and the several hospitals and dispensaries may deem advisable.

Meetings of State Medical Societies.—The following State Medical Societies will hold their annual meetings next month:—

Tennessee State Medical Society, at Knoxville, April 6.
Mississippi State Medical Society, at Vicksburg, April 7.
Alabama State Medical Society, at Huntsville, April 13.
Medico-Chirurgical Faculty of Maryland, at Baltimore, April 13.
South Carolina State Medical Society, at Columbia, April 20.
Georgia State Medical Society, at Augusta, April 21.
California State Medical Society, at San Francisco, April 21.

National Convention for Revising the United States Pharmacopœia.—The attention of "incorporated Sate Medical Societies, incorporated Medical Colleges, incorporated Colleges of Physicians and Surgeons, and incorporated Colleges of Pharmacy throughout the United States," is again invited to the importance of sending delegates to the National Convention for Revising the Pharmacopœia, which will meet in Washington on the 5th of May next. Each body is entitled to three delegates. It is requested that the names of delegates shall be forwarded to Dr. James E. Morgan, 905 E Street, N. W., Washington, D. C.

Gift of a "Loving-Cup" to the New York Academy of Medicine.

Mrs. John Jacob Astor has presented to the New York Academy of Medicine a beautifully wrought "loving-cup," "as a messenger of a true sympathy in the purposes of the Society" and with the expressed hope that it "may procure a moment's pleasure to those whose days hold, necessarily, so large a measure o care and sacrifice." It is of solid silver lined with gold, about a foot high and si inches in diameter. Its surface is ornamented by the acacia, the symbol of friendship and love. On the front is the seal of the Academy, its motto, and the hea of Hippocrates. Above is the name of the President, Dr. Fordyce Barker, an the date of his election, with spaces left for the names of his successors, while o its upper part, beneath the rim, is engraved the sentiment, "Peace and love b multiplied unto us."

Mrs. Astor, a few months ago, also presented to the Academy a check for tw hundred dollars, to be expended in the purchase of books for its library. Thi liberality, so graciously bestowed, is but another evidence of this bountiful lady' intelligence, benevolence, and philanthropy.

Public Honours to a Medical Victim.—The Paris municipality recently resolved that the names of the medical officers, students, or attendants, who die in consequence of the execution of their duty, should be inscribed on a table erected at the hospital at which the calamity occurred. M. Herbelin, an intern at the Sainte Eugénie, who has just died in the twenty-eighth year of his age, i consequence of diphtheria contracted in that hospital, makes the fifth victim during the last twelvemonth, three of the number having been internes. At th request of Dr. Lannelongue, whose *chef de service* he was, the President of th

Republic conferred on him prior to his death the Cross of Officer of the Legion of Honour, which seems to have given great satisfaction to the profession in Paris. His obsequies, too, assumed a quasi-public character in order to testify the sense entertained by the government, the municipal authorities, and the profession, of the self-sacrificing nature of the services rendered by the deceased and so many of his predecessors.—*Med. Times and Gaz.*, Jan. 17, 1880.

Literary Notes.

It will, we doubt not, gratify our numerous friends and readers to learn that the consolidation of the *News and Abstract* has met with a most hearty response from all quarters. In view of the diagnosis which, since the demise of the British and Foreign Medico-Chirurgical Review, some of our weekly contemporaries have been in the habit of making, that the day of "quarterlies and monthlies" has passed, and that their own form of journalism will alone suit the future wants of this fast age, it may be not without interest to our subscribers to have the assurance that the AMERICAN JOURNAL OF THE MEDICAL SCIENCES finds its sphere of usefulness as wide as ever; that its subscription list was never in a more healthy condition than at present, and that, so far from its mission being ended, it has every prospect of a career in the future even more prosperous than in the past.

The last number of the *Revue Internationale des Sciences Biologiques* (Jan. 15), has for its leading article a translation of Dr. C. K. Mills's excellent review on "Cerebral Localization," which appeared in the AMERICAN JOURNAL OF THE MEDICAL SCIENCES for July, 1879. It may be justly held to be a high endorsement of the merit of Dr. Mills's treatment of the subject, that it should have been considered desirable to reproduce the review in the country where so much original work has been done to advance our knowledge in this special line of research.

Dr. George M. Beard has in press a work on "Nervous Exhaustion," to be published by William Wood & Co.

G. P. Putnam's Sons announce a "Student's Manual of Venereal Diseases," by Dr. Frederick R. Sturgis; a treatise on the "Throat and its Functions," by Dr. Louis Elsberg; and a work on the "Human Eye in its Normal and Pathological Conditions," by Dr. Adolph Alt.

Houghton, Osgood & Co. have in press a translation of a monograph on the "Utricular Glands of the Uterus," by Professor Ercolani, of Bologna.

Lindsay & Blakiston have just published the "Spectroscope in Medicine," by Dr. Chas. A. MacMunn, of Dublin, and a clinical lecture "On the Internal Use of Water for the Sick," by J. Forsyth Meigs, M.D.

Macmillan & Co. have also just published Mr. Brudenell Carter's new work on "Eyesight: Good and Bad," and H. K. Lewis a monograph on "Experimental Researches on the Regional Temperature of the Head," by Dr. J. S. Lombard, formerly of Harvard University.

Dr. Lionel Beale is engaged on a work on "Slight Ailments: their Nature and Treatment."

Personal.—Professor Paul Broca has just been elected a life-senator by the French Senate.

OBITUARY RECORD.—At his residence in Wiltshire, on the 1st of January, aged 70, HENRY HANCOCK, F.R.C.S., formerly President of the Royal College of Surgeons.

—— At Clevedon, on the 9th of January, aged 69, WILLIAM BUDD, M.D., F.R.C.S., formerly of Bristol. Dr. Budd contributed a number of valuable paper to medical literature, but he is best known by his able and exhaustive treatise o "Typhoid Fever, its Nature, Mode of Spreading, and Prevention," which wa published in 1873, and at once established his reputation as an acute observe and logical thinker. So far back as the year 1839, when he was assisting hi father during a severe epidemic of typhoid fever in North Tawton, Dr. Bud arrived at the conviction that the fever was communicated from person to person, and that the specific poison which is the cause of the fever breeds and multiplies in the living body of the infected person, as is the case in smallpox, scarle fever, and some other diseases; and nowhere else. Continued observation le him to the conclusions that this specific poison is cast off from the intestines and that the excreta from the intestines may communicate the fever to othe persons in two ways—either by contaminating the drinking-water, or by infecting the air. Dr. Budd insisted that the ravages of typhoid fever might be immensely diminished, or even entirely prevented, by proper sanitary measure rigidly carried out—viz., by the *immediate* disinfection of all discharges from th bodies of persons suffering from the disease, of all articles of bed and body linen and of closets and drains; and by the universal maintenance of good drainag and sewerage, and of a supply of water not exposed to contamination.

—— At Boston, on the 9th of January, of heart disease, J. WINTHROP TAYLOR, M.D., late Surgeon-General U. S. Navy.

Dr. Taylor was a native of New York, and entered the Navy as Assistant Surgeon in 1838. He was made a Surgeon in 1852, and Medical Director i 1871. Since 1873 he has been attached to the Naval Rendezvous at Boston.

—— At his residence in this city, on the 11th of February, in the sixty-first yea of his age, JOHN NEILL, M.D., late Professor of Clinical Surgery in the University of Pennsylvania.

Dr. Neill graduated at the University of Pennsylvania in the Arts, in 1837 and in Medicine in 1840. In 1845 he was appointed Demonstrator of Anatomy in the University; in 1847 he was elected Surgeon to Wills Hospital; in 1852 Surgeon to the Pennsylvania Hospital; and in 1855 Surgeon to the Philadelphi Hospital. In 1861 he was appointed Surgeon-in-Charge of the Military Hospita in this city, and organized the first eight general hospitals. In 1874 he was appointed Professor of Clinical Surgery in the University of Pennsylvania. H contributed a number of valuable articles to the *American Journal of the Medical Sciences*, and was also the author of "Short Descriptions of the Arteries Nerves, Veins, and Lymphatics," with coloured plates; was joint author o Neill and Smith's Compendium, and was the American editor of Pirrie's Surgery.

—— At Notting-hill, on the 21st of January, aged 65, EDWARD CATO SEATON, M.D., Medical Officer of the Local Government Board.

Dr. Seaton contributed the article on Vaccination to Reynolds's "System o Medicine," and in 1867 he wrote his well-known "Handbook of Vaccination," which is a complete and elaborate exposition of the subject of which it treats. H was an acknowledged authority on all matters relating to Vaccination.

—— At Balham, on the 25th of January, J. A. LOCKHART CLARKE, M.D. F.R.S., aged sixty-three years.

Dr. Clarke is everywhere known by his valuable investigations into the minut anatomy and pathology of the central nervous system. His researches on some o the affections of the spinal cord and medulla oblongata gained for him the grea distinction of the Royal Medal of the Royal Society. He also discovered a ne method of investigating nervous tissue which entirely revolutionized histologica research.

(LATE HENRY C. LEA)

LASSIFIED CATALOGUE

OF

MEDICAL AND SURGICAL PUBLICATIONS.

asking the attention of the profession to the works advertised in the following s, the publishers would state that no pains are spared to secure a continuance of onfidence earned for the publications of the house by their careful selection and racy and finish of execution.

e printed prices are those at which books can generally be supplied by booksellers ghout the United States, who can readily procure for their customers any works ept in stock. Where access to bookstores is not convenient, books will be sent il post-paid on receipt of the price, and as the limit of mailable weight has been ed, no difficulty will be experienced in obtaining through the post-office any in this catalogue. No risks, however, are assumed either on the money or ks, and no publications but our own are supplied, so that gentlemen will in ases find it more convenient to deal with the nearest bookseller.

ILLUSTRATED CATALOGUE, of 64 octavo pages, handsomely printed, will be for- by mail, post-paid, on receipt of ten cents.

HENRY C. LEA'S SON & CO.

706 and 708 SANSOM ST., PHILADELPHIA, March, 1880.

INCREASED INDUCEMENT FOR SUBSCRIBERS TO

AMERICAN JOURNAL OF THE MEDICAL SCIENCES.

TWO MEDICAL JOURNALS, containing nearly 2000 LARGE PAGES,

Free of Postage, for FIVE DOLLARS Per Annum.

TERMS FOR 1880.

AMERICAN JOURNAL OF THE MEDICAL SCIENCES, published quarterly (1150 pages per annum), with MEDICAL NEWS AND ABSTRACT, monthly (768 pp. per annum), } Five Dollars per annum, in advance.

SEPARATE SUBSCRIPTIONS TO

AMERICAN JOURNAL OF THE MEDICAL SCIENCES, when not paid for in advance, Five Dollars.

MEDICAL NEWS AND ABSTRACT, free of postage, in advance, Two Dollars and a half.

Advance-paying subscribers can obtain at the close of the year cloth covers, ed, for each volume of the Journal (two annually), and of the News and act (one annually), free by mail, by remitting ten cents for each cover.

---

ill thus be seen that for the moderate sum of FIVE DOLLARS in advance, scriber will receive, free of postage, the equivalent of three or four large volumes, stored with the choicest matter, original and selected, that can nished by the medical literature of both hemispheres. Thus taken to- r, the "JOURNAL," and the "NEWS AND ABSTRACT" combine the advantages of borate preparation that can be devoted to the Quarterly with the prompt yance of intelligence by the Monthly; while, the whole being under a single ial supervision, the subscriber is secured against the duplication of matter able when periodicals from different sources are taken together.

e periodicals thus offered at this unprecedented rate are universally known for

For "THE OBSTETRICAL JOURNAL," see p. 24.)

their high professional standing.

I.

THE AMERICAN JOURNAL OF THE MEDICAL SCIENC

EDITED BY I. MINIS HAYS, M.D.,

for more than half a century has maintained its position in the front rank
medical literature of the world. Cordially supported by the profession of Am
it circulates wherever the language is read, and is universally regarded as a na
exponent of American medicine—a position to which it is entitled by the
guished names from every section of the Union which are to be found amo
collaborators.* It is issued quarterly, in January, April, July, and Octobe
number containing about three hundred octavo pages, appropriately illu
wherever necessary. A large portion of this space is devoted to Original C
nications, embracing papers from the most eminent members of the pro
throughout the country.

Following this is the REVIEW DEPARTMENT, containing extended reviews b
petent writers of prominent new works and topics of the day, together with
ous elaborate Analytical and Bibliographical Notices, giving a fairly compl
vey of medical literature.

Then follows the QUARTERLY SUMMARY OF IMPROVEMENTS AND DISCOVE
THE MEDICAL SCIENCES, classified and arranged under different heads, and f
ing a digest of medical progress, abroad and at home.

Thus during the year 1878 the "JOURNAL" contained 77 Original Com
tions, mostly elaborate in character, 133 Reviews and Bibliographical Noti
255 articles in the Quarterly Summaries, illustrated with 48 maps and w
gravings.

That the efforts thus made to maintain the high reputation of the "JOUR
successful, is shown by the position accorded to it in both America and Eur
leading organ of medical progress:—

This is universally acknowledged as the leading American Journal, and has been conducted by Dr. Hays alone until 1869, when his son was associated with him. We quite agree with the critic, that this journal is second to none in the language, and cheerfully accord to it the first place, for nowhere shall we find more able and more impartial criticism, and nowhere such a repertory of able original articles. Indeed, now that the "British and Foreign Medico-Chirurgical Review" has terminated its career, the American Journal stands without a rival.—*London Med. Times and Gazette*, Nov. 24, 1877.

The best medical journal on the continent —*Boston Med and Surg. Journal*, April 17, 1879.

The present number of the American Journal is an exceedingly good one, and gives every promise of maintaining the well earned reputation of the review Our venerable contemporary has our best wishes, and we can only express the hope that it may continue its work with as much vigor and excellence for the next fifty years as it has exhibited in the past. —*London Lancet*, Nov. 24, 1877.

The Philadelphia Medical and Physic
issued its first number in 1820, and, after
career, was succeeded in 1827 by the
Journal of the Medical Sciences, a per
world-wide reputation; the ablest and
oldest periodicals in the world—a journal
an unsullied record.—*Gross's History of
Med. Literature*, 1876.

It is universally acknowledged to be th
American medical journal, and, in our o
second to none in the language.—*Boston
Surg. Journal*, Oct. 1877.

This is the medical journal of our countr
the American physician abroad will poin
greatest satisfaction, as reflecting the stat
culture in his country. For a great ma
has been the medium through which our
ers have made known their discoveries a
tions —*Address of L. P. Yandell, M.D.,
national Med. Congress*, Sept. 1876.

And that it was specifically included in the award of a medal of merit to the P
in the Vienna Exhibition in 1873.

The subscription price of the "AMERICAN JOURNAL OF THE MEDICAL SCIENC
never been raised during its long career. It is still FIVE DOLLARS per annu
when paid for in advance, the subscriber receives in addition the "MEDICAL N
ABSTRACT," making in all nearly 2000 large octavo pages per annum, free of p

* Communications are invited from gentlemen in all parts of the country. Elaborate articles by the Editor are paid for by the Publishers.

ent information which could not be accommodated in the Quarterly. It con-
d of sixteen pages of such matter, together with sixteen more known as the
ry Department and devoted to the publishing of books. With the increased
ess of science, however, this was found insufficient and some years since an-
r periodical. known as the "MONTHLY ABSTRACT," was started, and was fur-
d at a moderate price to subscribers to the "AMERICAN JOURNAL." These
onthlies will hereafter be consolidated, under the title of "THE MEDICAL
AND ABSTRACT," and will be furnished *free of charge* in connection with the
RICAN JOURNAL."

"NEWS AND ABSTRACT" will consist of 64 pages monthly, in a neat cover.
contain a CLINICAL DEPARTMENT in which will be continued the series of
AL AMERICAN CLINICAL LECTURES, by gentlemen of the highest reputation
out the United States, together with a choice selection of foreign Lectures
spital Notes and Gleanings. Then will follow the MONTHLY ABSTRACT, sys-
ally arranged and classified, and presenting five or six hundred articles yearly;
h number will conclude with a NEWS DEPARTMENT, giving current profes-
intelligence, domestic and foreign, the whole fully indexed at the close of
ume, rendering it of permanent value for reference.

ated above, the subscription price to the "NEWS AND ABSTRACT" will be
llars and a Half per annum, invariably in advance, at which rate it will rank
f the cheapest medical periodicals in the country. But it will also be fur-
free of all charge, in commutation with the "AMERICAN JOURNAL OF THE
SCIENCES," to all who remit FIVE DOLLARS in advance, thus giving to the
er, for that very moderate sum, a complete record of medical progress
out the world, in the compass of about two thousand large octavo pages.

is effort to furnish so large an amount of practical information at a price so
edentedly low, and thus place it within the reach of every member of the
on, the publishers confidently anticipate the friendly aid of all who feel an
in the dissemination of sound medical literature. They trust, especially, that
cribers to the "AMERICAN MEDICAL JOURNAL" will call the attention of their
tances to the advantages thus offered, and that they will be sustained in the
r to permanently establish medical periodical literature on a footing of
s never heretofore attempted.

IUM FOR OBTAINING NEW SUBSCRIBERS TO THE "JOURNAL."

entleman who will remit the amount for two subscriptions for 1880, one of
least must be for a *new subscriber*, will receive as a PREMIUM, free by mail, a
ay one of the following recent works:

ES'S MANUAL OF MIDWIFERY" (see p. 24),
URY FOX'S EPITOME OF DISEASES OF THE SKIN," new edition, just ready,
(see p. 18).
ERGILL'S ANTAGONISM OF MEDICINES" (see p. 16),
LDEN'S LANDMARKS, MEDICAL AND SURGICAL" (see p. 6),
BROWNE ON THE USE OF THE OPHTHALMOSCOPE" (see p. 29),
LINT'S ESSAYS ON CONSERVATIVE MEDICINE" (see p. 15),
URGES'S CLINICAL MEDICINE" (see p. 14),
WAYNE'S OBSTETRIC APHORISMS," new edition (see p. 21),
ANNER'S CLINICAL MANUAL" (see p. 5),
EST ON NERVOUS DISORDERS OF CHILDREN" (see p. 20).

Gentlemen desiring to avail themselves of the advantages thus offered will do
forward their subscriptions at an early day, in order to insure the receipt of
te sets for the year 1880.

The safest mode of remittance is by bank check or postal money order, drawn
order of the undersigned. Where these are not accessible, remittances for the

Address,

HENRY C. LEA'S SON & CO., Nos. 706 and 708 Sansom St., Phila., Pa.

DUNGLISON (ROBLEY), M.D.,

Late Professor of Institutes of Medicine in Jefferson Medical College, Philadelphia.

MEDICAL LEXICON; A DICTIONARY OF MEDICAL SCIENCE: (taining a concise explanation of the various Subjects and Terms of Anatomy, Phy Pathology, Hygiene, Therapeutics, Pharmacology, Pharmacy, Surgery, Obstetrics, M Jurisprudence, and Dentistry. Notices of Climate and of Mineral Waters; Form Officinal, Empirical, and Dietetic Preparations; with the Accentuation and Etymo the Terms, and the French and other Synonymes; so as to constitute a French a English Medical Lexicon. A New Edition. Thoroughly Revised, and very greatly ified and Augmented. By RICHARD J. DUNGLISON, M.D. In one very large and some royal octavo volume of over 1100 pages. Cloth, $6 50; leather, raised bands, ((*Just Issued.*)

The object of the author from the outset has not been to make the work a mere le dictionary of terms, but to afford, under each, a condensed view of its various medical re and thus to render the work an epitome of the existing condition of medical science. S with this view, the immense demand which has existed for the work has enabled him, in r revisions, to augment its completeness and usefulness, until at length it has attained the of a recognized and standard authority wherever the language is spoken.

Special pains have been taken in the preparation of the present edition to maintain t viable reputation. During the ten years which have elapsed since the last revision, the ad to the nomenclature of the medical sciences have been greater than perhaps in any similar of the past, and up to the time of his death the author labored assiduously to incorporate thing requiring the attention of the student or practitioner. Since then, the editor h equally industrious, so that the additions to the vocabulary are more numerous than in vious revision. Especial attention has been bestowed on the accentuation, which will b marked on every word. The typographical arrangement has been much improved, re reference much more easy, and every care has been taken with the mechanical executi work has been printed on new type, small but exceedingly clear, with an enlarged page, the additions have been incorporated with an increase of but little over a hundred p the volume now contains the matter of at least four ordinary octavos.

A book well known to our readers, and of which every American ought to be proud. When the learned author of the work passed away, probably all of us feared lest the book should not maintain its place in the advancing science whose terms it defines. Fortunately, Dr. Richard J. Dunglison, having assisted his father in the revision of several editions of the work, and having been, therefore, trained in the methods and imbued with the spirit of the book, has been able to edit it, not in the patchwork manner so dear to the heart of book editors, so repulsive to the taste of intelligent book readers, but to edit it as a work of the kind should be edited—to carry it on steadily, without jar or interruption, along the grooves of thought it has travelled during its lifetime. To show the magnitude of the task which Dr Dunglison has assumed and carried through, it is only necessary to state that more than six thousand new subjects have been added in the present edition.—*Phila. Med. Times*, Jan. 3, 1874.

About the first book purchased by the medical student is the Medical Dictionary. The lexicon explanatory of technical terms is simply a *sine qua non*. In a science so extensive, and with such collaterals as medicine, it is as much a necessity also to the practising physician. To meet the wants of students and most physicians, the dictionary must be condensed while comprehensive, and practical while perspicacious. It was because Dunglison's met these indications that it became at once the dictionary of general use wherever medicine was studied in the English language. In no former revision have the alterations and additions been so great. More than six thousand new subjects and terms have been added. The chief terms have been set in black letter, while the derivatives follow in small caps; an arrangement which greatly facilitates reference. We may safely confirm the hope ventured by t "that the work, which possesses for him a fi as an individual interest, will be found wort tinuance of the position so long accorded standard authority."—*Cincinnati Clinic*, Ja

It has the rare merit that it certainly has in the English language for accuracy and references.—*London Medical Gazette*

As a standard work of reference, as one of if not the very best, medical dictionary in lish language, Dunglison's work has been w for about forty years, and needs no words on our part to recommend it to the memb medical, and, likewise, of the pharmace fession. The latter especially are in need work, which gives ready and reliable in on thousands of subjects and terms which liable to encounter in pursuing their dai tions, but with which they cannot be expe familiar. The work before us fully sup want.—*Am. Journ. of Pharm.*, Feb. 1874.

A valuable dictionary of the terms em medicine and the allied sciences, and of tions of the subjects treated under each he flects great credit on its able American au well deserves the authority and popularit obtained.—*British Med. Journ.*, Oct. 31, 18

Few works of this class exhibit a grand ment of patient research and of scientific l extent of the sale of this lexicon is suffici tify to its usefulness, and to the great ser ferred by Dr. Robley Dunglison on the pr and indeed on others, by its issue.—*Londo* May 13 1875.

HOBLYN (RICHARD D.), M.D

A DICTIONARY OF THE TERMS USED IN MEDICINE A THE COLLATERAL SCIENCES. Revised, with numerous additions, by ISAAC M.D., Editor of the "American Journal of the Medical Sciences." In one larg 12mo. volume of over 500 double-columned pages; cloth, $1 50; leather, $2 00

It is the best book of definitions we have, and ought always to be upon the student's table.—*So Med. and Surg. Journal.*

RODWELL (G. F.), F.R.A.S., &c.

A DICTIONARY OF SCIENCE: Comprising Astronomy, istry, Dynamics, Electricity, Heat, Hydrodynamics, Hydrostatics, Light, Ma Mechanics, Meteorology, Pneumatics, Sound, and Statics. Preceded by an Essay History of the Physical Sciences. In one handsome octavo volume of 694 pag many illustrations: cloth, $5.

A CENTURY OF AMERICAN MEDICINE, 1776–1876.

By Doctors E. H. Clarke, H. J. Bigelow, S. D. Gross, T. G. Thomas, and J. S. Billings. In one very handsome 12mo. volume of about 350 pages: cloth, $2 25. (*Just Ready.*)

This work appeared in the pages of the American Journal of the Medical Sciences during the year 1876. As a detailed account of the development of medical science in America, by gentlemen of the highest authority in their respective departments, the profession will no doubt welcome it in a form adapted for preservation and reference.

NEILL (JOHN), M.D., and SMITH (FRANCIS G.), M.D.,

Prof. of the Institutes of Medicine in the Univ. of Penna.

AN ANALYTICAL COMPENDIUM OF THE VARIOUS BRANCHES OF MEDICAL SCIENCE; for the Use and Examination of Students. A new edition, revised and improved. In one very large and handsomely printed royal 12mo. volume, of about one thousand pages, with 374 wood-cuts, cloth, $4; strongly bound in leather, with raised bands, $4 75.

HARTSHORNE (HENRY), M.D.,

Professor of Hygiene in the University of Pennsylvania.

A CONSPECTUS OF THE MEDICAL SCIENCES; containing Handbooks on Anatomy, Physiology, Chemistry, Materia Medica, Practical Medicine, Surgery, and Obstetrics. Second Edition, thoroughly revised and improved. In one large royal 12mo. volume of more than 1000 closely printed pages, with 477 illustrations on wood. Cloth, $4 25; leather, $5 00. (*Lately Issued.*)

We can say with the strictest truth that it is the best work of the kind with which we are acquainted. It embodies in a condensed form all recent contributions to practical medicine, and is therefore useful to every busy practitioner throughout our country, besides being admirably adapted to the use of students of medicine. The book is faithfully and ably executed.—*Charleston Med. Journ.*, April, 1875.

The work is intended as an aid to the medical student, and as such appears to admirably fulfil its object by its excellent arrangement, the full compilation of facts, the perspicuity and terseness of language, and the clear and instructive illustrations in some parts of the work.—*American Journ. of Pharmacy*, Philadelphia, July, 1874.

The volume will be found useful, not only to students, but to many others who may desire to refresh their memories with the smallest possible expenditure of time.—*N. Y. Med. Journal*, Sept. 1874.

The student will find this the most convenient and useful book of the kind on which he can lay his hand.—*Pacific Med. and Surg. Journ.*, Aug. 1874.

This is the best book of its kind that we have ever examined. It is an honest, accurate, and concise compend of medical sciences, as fairly as possible representing their present condition. The changes and the additions have been so judicious and thorough as to render it, so far as it goes, entirely trustworthy. If students must have a conspectus, they will be wise to procure that of Dr. Hartshorne.—*Detroit Rev. of Med. and Pharm.*, Aug. 1874.

The work before us, however, has many redeeming features not possessed by others, and is the best we have seen. Dr. Hartshorne exhibits much skill in condensation. It is well adapted to the physician in active practice, who can give but limited time to the familiarizing of himself with the important changes which have been made since he attended lectures. The manual of physiology has also been improved and gives the most comprehensive view of the latest advances in the science possible in the space devoted to the subject. The mechanical execution of the book leaves nothing to be wished for.—*Peninsular Journal of Medicine*, Sept. 1874.

After carefully looking through this conspectus, we are constrained to say that it is the most complete work, especially in its illustrations, of its kind that we have seen.—*Cincinnati Lancet*, Sept. 1874.

The favor with which the first edition of this Compendium was received, was an evidence of its various excellences. The present edition bears evidence of a careful and thorough revision. Dr. Hartshorne possesses a happy faculty of seizing upon the salient points of each subject, and of presenting them in a concise and yet perspicuous manner.—*Leavenworth Med. Herald*, Oct. 1874

LUDLOW (J. L.), M.D.

A MANUAL OF EXAMINATIONS upon Anatomy, Physiology, Surgery, Practice of Medicine, Obstetrics, Materia Medica, Chemistry, Pharmacy, and Therapeutics. To which is added a Medical Formulary. Third edition, thoroughly revised and greatly extended and enlarged. With 370 illustrations. In one handsome royal 12mo. volume of 816 large pages, cloth, $3 25; leather, $3 75.

The arrangement of this volume in the form of question and answer renders it especially suitable for the office examination of students, and for those preparing for graduation.

TANNER (THOMAS HAWKES), M.D., &c.

A MANUAL OF CLINICAL MEDICINE AND PHYSICAL DIAGNOSIS. Third American from the Second London Edition. Revised and Enlarged by TILBURY FOX, M. D., Physician to the Skin Department in University College Hospital, &c. In one neat volume small 12mo., of about 375 pages, cloth, $1 50.

⁂ On page 3, it will be seen that this work is offered as a premium for procuring new subscribers to the "AMERICAN JOURNAL OF THE MEDICAL SCIENCES."

GRAY (HENRY), F.R.S.,

Lecturer on Anatomy at St. George's Hospital, London.

ANATOMY, DESCRIPTIVE AND SURGICAL. The Drawings by H. V. CARTER, M.D., and Dr. WESTMACOTT. The Dissections jointly by the AUTHOR and Dr. CARTER. With an Introduction on General Anatomy and Development by T. HOLMES, M.A., Surgeon to St. George's Hospital. A new American, from the eighth enlarged and improved London edition. To which is added "LANDMARKS, MEDICAL AND SURGICAL," by LUTHER HOLDEN, F.R.C.S., author of "Human Osteology," "A Manual of Dissections," etc. In one magnificent imperial octavo volume of 983 pages, with 622 large and elaborate engravings on wood. Cloth, $6; leather, raised bands, $7. (*Just Ready.*)

The author has endeavored in this work to cover a more extended range of subjects than is customary in the ordinary text-books, by giving not only the details necessary for the student, but also the application of those details in the practice of medicine and surgery, thus rendering it both a guide for the learner, and an admirable work of reference for the active practitioner. The engravings form a special feature in the work, many of them being the size of nature, nearly all original, and having the names of the various parts printed on the body of the cut, in place of figures of reference, with descriptions at the foot. They thus form a complete and splendid series, which will greatly assist the student in obtaining a clear idea of Anatomy, and will also serve to refresh the memory of those who may find in the exigencies of practice the necessity of recalling the details of the dissecting room; while combining, as it does, a complete Atlas of Anatomy, with a thorough treatise on systematic, descriptive, and applied Anatomy, the work will be found of essential use to all physicians who receive students in their offices, relieving both preceptor and pupil of much labor in laying the groundwork of a thorough medical education.

Since the appearance of the last American Edition, the work has received three revisions at the hands of its accomplished editor, Mr. Holmes, who has sedulously introduced whatever has seemed requisite to maintain its reputation as a complete and authoritative standard text-book and work of reference. Still further to increase its usefulness, there has been appended to it the recent work by the distinguished anatomist, Mr. Luther Holden—"Landmarks, Medical and Surgical"—which gives in a clear, condensed, and systematic way, all the information by which the practitioner can determine from the external surface of the body the position of internal parts. Thus complete, the work, it is believed, will furnish all the assistance that can be rendered by type and illustration in anatomical study. No pains have been spared in the typographical execution of the volume, which will be found in all respects superior to former issues. Notwithstanding the increase of size, amounting to over 100 pages and 57 illustrations, it will be kept, as heretofore, at a price rendering it one of the cheapest works ever offered to the American profession.

The recent work of Mr. Holden, which was noticed by us on p. 53 of this volume, has been added as an appendix, so that, altogether, this is the most practical and complete anatomical treatise available to American students and physicians. The former finds in it the necessary guide in making dissections; a very comprehensive chapter on minute anatomy; and about all that can be taught him on general and special anatomy; while the latter, in its treatment of each region from a surgical point of view, and in the valuable edition of Mr Holden, will find all that will be essential to him in his practice —*New Remedies*, Aug. 1878.

This work is as near perfection as one could possibly or reasonably expect any book intended as a text-book or a general reference book on anatomy to be. The American publisher deserves the thanks of the profession for appending the recent work of Mr. Holden, "*Landmarks, Medical and Surgical*," which has already been commended as a separate book. The latter work—treating of topographical anatomy—has become an essential to the library of every intelligent practitioner. We know of no book that can take its place, written as it is by a most distinguished anatomist. It would be simply a waste of words to say anything further in praise of Gray's Anatomy, the text-book in almost every medical college in this country, and the daily reference book of every practitioner who has occasion to consult his books on anatomy. The work is simply indispensable, especially this present American edition.—*Va. Med. Monthly*, Sept. 1878.

The addition of the recent work of Mr. Holden, as an appendix, renders this the most practical and complete treatise available to American students, who find in it a comprehensive chapter on minute anatomy, about all that can be taught on general and special anatomy, while its treatment of each region, from a surgical point of view, in the valuable section by Mr. Holden, is all that will be essential to them in practice.—*Ohio Medical Recorder*, Aug 1878.

It is difficult to speak in moderate terms of this new edition of "Gray." It seems to be as nearly perfect as it is possible to make a book devoted to any branch of medical science. The labors of the eminent men who have successively revised the eight editions through which it has passed, would seem to leave nothing for future editors to do. The addition of Holden's "Landmarks" will make it as indispensable to the practitioner of medicine and surgery as it has been heretofore to the student. As regards completeness, ease of reference, utility, beauty, and cheapness, it has no rival. No student should enter a medical school without it; no physician can afford to have it absent from his library.—*St. Louis Clin. Record*, Sept. 1878.

ALSO FOR SALE SEPARATE—

HOLDEN (LUTHER), F.R.C.S.,

Surgeon to St. Bartholomew's and the Foundling Hospitals.

LANDMARKS, MEDICAL AND SURGICAL. From the 2d London Ed. In one handsome volume, royal 12mo., of 128 pages: cloth, 88 cents. (*Now Ready.*)

HEATH (CHRISTOPHER), F.R.C.S.,

Teacher of Operative Surgery in University College, London.

PRACTICAL ANATOMY: A Manual of Dissections. From the Second revised and improved London edition. Edited, with additions, by W. W. KEEN, M. D., Lecturer on Pathological Anatomy in the Jefferson Medical College, Philadelphia. In one handsome royal 12mo. volume of 578 pages, with 247 illustrations. Cloth, $3 50; leather, $4 00.

LLEN (HARRISON), M.D.
Professor of Physiology in the Univ. of Pa.

SYSTEM OF HUMAN ANATOMY: INCLUDING ITS MEDICAL and Surgical Relations. For the Use of Practitioners and Students of Medicine. With an Introductory Chapter on Histology. By E. O. SHAKESPEARE, M D, Ophthalmologist to the Phila. Hosp. In one large and handsome quarto volume, with several hundred original illustrations on lithographic plates, and numerous wood-cuts in the text. (*Preparing.*)

this elaborate work, which has been in active preparation for several years, the author has to give, not only the details of descriptive anatomy in a clear and condensed form, but also ctical applications of the science to medicine and surgery. The work thus has claims upon ttention of the general practitioner, as well as of the student, enabling him not only to re- his recollections of the dissecting room, but also to recognize the significance of all varia- from normal conditions. The marked utility of the object thus sought by the author is ident, and his long experience and assiduous devotion to its thorough development are a at guarantee of the manner in which his aims have been carried out. No pains have been with the illustrations. Those of normal anatomy are from original dissections, drawn on by Mr. Hermann Faber, with the name of every part clearly engraved upon the figure, e manner of "Holden" and "Gray," and in every typographical detail it will be the f the publisher to render the volume worthy of the very distinguished position which is ated for it.

IS (GEORGE VINER).
Emeritus Professor of Anatomy in University College, London.

MONSTRATIONS OF ANATOMY; Being a Guide to the Know- dge of the Human Body by Dissection. By GEORGE VINER ELLIS, Emeritus Professor f Anatomy in University College, London. From the Eighth and Revised London dition. In one very handsome octavo volume of over 700 pages, with 256 illustrations. loth, $4.25; leather, $5.25. (*Just Ready.*)

ork has long been known in England as the leading authority on practical anatomy, favorite guide in the dissecting-room, as is attested by the numerous editions through has passed. In the last revision, which has just appeared in London, the accomplished as sought to bring it on a level with the most recent advances of science by making the y changes in his account of the microscopic structure of the different organs, as devel- the latest researches in textural anatomy.

Demonstrations is the favorite text-book nglish student of anatomy. In passing ight editions it has been so revised and to the needs of the student hat it would it had almost reached perfection in this line. The descriptions are clear, and the f pursuing anatomical investigations are th such detail that the book is honestly to its name.—*St. Louis Clinical Record*,

ccess of this old manual seems to be as well in the present as in the past volumes. seems destined to maintain yet for years its leadership over the English manuals upon dissecting.—*Phila. Med. Times*, May 24, 1879.

As a dissector, or a work to have in hand and studied while one is engaged in dissecting, we regard it as the very best work extant, which is certainly saying a very great deal. As a text-book to be studied in the dissecting-room, it is superior to any of the works upon anatomy.—*Cincinnati Med. News*, May 24, 1879.

We most unreservedly recommend it to every practitioner of medicine who can possibly get it.—*Va. Med. Monthly*, June, 1879.

LSON (ERASMUS), F.R.S.

SYSTEM OF HUMAN ANATOMY, General and Special. Edited W. H. GOBRECHT, M.D, Professor of General and Surgical Anatomy in the Medical Col- e of Ohio. Illustrated with three hundred and ninety-seven engravings on wood. In large and handsome octavo volume, of over 600 large pages; cloth, $4; leather, $5.

H (HENRY H.), M.D., and *HORNER (WILLIAM E.), M.D.,*
f Surgery in the Univ. of Penna., &c. *Late Prof. of Anatomy in the Univ. of Penna.*

ANATOMICAL ATLAS; illustrative of the Structure of the uman Body. In one volume, large imperial octavo, cloth, with about six hundred and fty beautiful figures. $4 50.

AFER (EDWARD ALBERT), M.D.,
Assistant Professor of Physiology in University College, London.

COURSE OF PRACTICAL HISTOLOGY: Being an Introduction to the Use of the Microscope. In one handsome royal 12mo. volume of 304 pages, with numerous illustrations: cloth, $2 00. (*Just Issued.*)

ER'S SPECIAL ANATOMY AND HISTOL- . Eighth edition, extensively revised and ed. In 2 vols. 8vo., of over 1000 pages, wood-cuts: cloth, $6 00

Y AND QUAIN'S HUMAN ANATOMY. ed, by JOSEPH LEIDY, M.D., Prof of Anat. iv. of Penn. In two octavo vols. of about pages, with 511 illustrations. Cloth, $6 00.

BELLAMY'S STUDENT'S GUIDE TO SURGICAL ANATOMY: A Text book for Students preparing for their Pass Examination. With engravings on wood In one handsome royal 12mo. volume Cloth, $2 25.

CLELAND'S DIRECTORY FOR THE DISSECTION OF THE HUMAN BODY. In one small volume royal 12mo. of 182 pages: cloth $1 25.

CARPENTER (WILLIAM B.), M.D., F.R.S., F.G.S., F.L.S.,
Registrar to University of London, etc.

PRINCIPLES OF HUMAN PHYSIOLOGY; Edited by HENRY POWER, M.B. Lond., F.R.C.S., Examiner in Natural Sciences, University of Oxford. A new American from the Eighth Revised and Enlarged English Edition, with Notes and Additions, by FRANCIS G. SMITH, M.D., Professor of the Institutes of Medicine in the University of Pennsylvania, etc. In one very large and handsome octavo volume, of 1083 pages, with two plates and 373 engravings on wood; cloth, $5 50; leather, $6 50. (*Just Issued.*)

The great work, the crowning labor of the distinguished author, and through which so many generations of students have acquired their knowledge of Physiology, has been almost metamorphosed in the effort to adapt it thoroughly to the requirements of modern science. Since the appearance of the last American edition, it has had several revisions at the experienced hand of Mr. Power, who has modified and enlarged it so as to introduce all that is important in the investigations and discoveries of England, France, and Germany, resulting in an enlargement of about one-fourth in the text. The series of illustrations has undergone a like revision, a large proportion of the former ones having been rejected, and the total number increased to nearly four hundred. The thorough revision which the work has so recently received in England, has rendered unnecessary any elaborate additions in this country, but the American Editor, Professor Smith, has introduced such matters as his long experience has shown him to be requisite for the student. Every care has been taken with the typographical execution, and the work is presented, with its thousand closely, but clearly printed pages, as emphatically the text-book for the student and practitioner of medicine—the one in which, as heretofore, especial care is directed to show the applications of physiology in the various practical branches of medical science. Notwithstanding its very great enlargement, the price has not been increased, rendering this one of the cheapest works now before the profession.

We have been agreeably surprised to find the volume so complete in regard to the structure and functions of the nervous system in all its relations, a subject that, in many respects, is one of the most difficult of all, in the whole range of physiology, upon which to produce a full and satisfactory treatise of the class to which the one before us belongs. The additions by the American editor give to the work as it is a considerable value beyond that of the last English edition. In conclusion, we can give our cordial recommendation to the work as it now appears. The editors have, with their additions to the only work on physiology in our language that, in the fullest sense of the word, is the production of a philosopher as well as a physiologist, brought it up as fully as could be expected, if not desired, to the standard of our knowledge of its subject at the present day. It will deservedly maintain the place it has always had in the favor of the medical profession.—*Journ. of Nervous and Mental Disease*, April, 1877.

Such enormous advances have recently been made in our physiological knowledge, that what was perfectly new a year or two ago, looks now as if it had been a received and established fact for years. In this encyclopædic way it is unrivalled. Here, as it seems to us, is the great value of the book; one is safe in sending a student to it for information on almost any given subject, perfectly certain of the fulness of information it will convey, and well satisfied of the accuracy with which it will there be found stated.—*London Med. Times and Gazette*, Feb. 17, 1877.

The merits of "Carpenter's Physiology" are so widely known and appreciated that we need only allude briefly to the fact that in the latest edition will be found a comprehensive embodiment of the results of recent physiological investigation. Care has been taken to preserve the practical character of the original work. In fact the entire work has been brought up to date, and bears evidence of the amount of labor that has been bestowed upon it by its distinguished editor, Mr. Henry Power. The American editor has made the latest additions, in order fully to cover the time that has elapsed since the last English edition.—*N. Y. Med. Journal*, Jan. 1877.

FOSTER (MICHAEL), M.D., F.R.S.,
Prof. of Physiology in Cambridge Univ., England.

TEXT-BOOK OF PHYSIOLOGY. A new American, from the third English edition. Edited with notes and additions by EDWARD T. REICHERT, M.D., Demonstrator of Experimental Therapeutics in Univ. of Penna. In one handsome royal 12mo. volume, with over 250 illustrations. (*Nearly Ready.*)

The excellence of Mr. Foster's work as an exposition of functional physiology has long been recognized, while for the purposes of the student it has been somewhat deficient as respects the details of structure so necessary to render intelligible the views and theories of the science. These it has been the effort of the editor to add in as concise a manner as possible, and in aid of this he has freely introduced illustrations from recognized authorities. In this improved form it is therefore hoped that the work may prove more than ever acceptable to the student as a clear and comprehensive text-book, presenting the science in its latest development.

On the whole the book can be called the standard work in the English language, while it has none superior in any other tongue. It is, perhaps, the only work in our language which represents physiology fully as an experimental science. Its completeness is admirable. The anxious student can find not only the actual facts of the science, but also the mode in which they were obtained. The author proves to the student not only a compiler but a judicious critic.—*Journ. of Nervous and Mental Diseases*, Jan. 1880.

The work, since its first appearance, has continued to be one of the most satisfactory text-books on the subject that we have met with, and is in many respects peculiarly adapted to the use of practitioners. Those whose knowledge of the functions of organs was chiefly acquired a decade ago, and who have not since been diligent students of the subject, can little appreciate what advances have been made, and can do nothing better than to give Dr. Foster's work some careful reading.—*New Remedies*, Jan. 1880.

The author of this book is too well known to physiologists to require an introduction. His contributions to this branch of science have secured for him lasting fame. As an advanced thinker and writer his views and teaching are regarded as the highest authority, and may be accepted as the latest outcome of physiological research and study.—*Maryland Med. Journal*, Feb. 1880.

An elaborate review at present is not required; it is only necessary to say that it is the best book of its immediate scope in any of the three languages, so far, at least, as our knowledge goes.—*Philada. Med. Times*, Jan. 3, 1880.

HARTSHORNE'S HANDBOOK OF ANATOMY AND PHYSIOLOGY. Second edition, revised. In one royal 12mo. vol., with 220 wood-cuts; cloth, $1 75.

LEHMANN'S MANUAL OF CHEMICAL PHYSIOLOGY. Translated from the German, with Notes and Additions, by J. CHESTON MORRIS, M.D. With illustrations on wood. In one octavo volume of 336 pages. Cloth, $2 25.

ness and perspicuity, Dalton's Physiology
itself to the student years ago, and was a
ef from the verbose productions which it
Physiology has, however, made many ad-
then—and while the style has been pre-
, the work in the present edition has been
lly abreast of the times. The new chemical
nomenclature have also been introduced
ent edition. Notwithstanding the multi-
t-books on physiology, this will lose none
popularity. The mechanical execution
is all that could be desired.—*Peninsular*
Medicine, Dec. 1875.

This popular text-book on physiology comes to us in its sixth edition with the addition of about fifty per cent. of new matter, chiefly in the departments of pathological chemistry and the nervous system, where the principal advances have been realized. With so thorough revision and additions, that keep the work well up to the times, its continued popularity may be confidently predicted, notwithstanding the competition it may encounter. The publisher's work is admirably done.—*St. Louis Med. and Surg. Journ.*, Dec. 1875.

We heartily welcome this, the sixth edition of this admirable text-book, than which there are none of equal brevity more valuable. It is cordially recommended by the Professor of Physiology in the University of Louisiana, as by all competent teachers in the United States, and wherever the English language is read, this book has been appreciated. The present edition, with its 316 admirably executed illustrations, has been carefully revised and very much enlarged, although its bulk does not seem perceptibly increased.—*New Orleans Medical and Surgical Journal*, March, 1876.

The present edition is very much superior to every other, not only in that it brings the subject up to the times, but that it does so more fully and satisfactorily than any previous edition. Take it altogether it remains in our humble opinion, the best text-book on physiology in any land or language.—*The Clinic*, Nov. 6, 1875.

As a whole, we cordially recommend the work as a text-book for the student, and as one of the best.—*The Journal of Nervous and Mental Disease*, Jan. 1876.

Still holds its position as a masterpiece of lucid writing, and is, we believe, on the whole, the best book to place in the hands of the student.—*London Students' Journal.*

FOWNES (GEORGE), Ph.D.

A MANUAL OF ELEMENTARY CHEMISTRY; Theoretical

Practical. Revised and corrected by HENRY WATTS, B.A., F.R.S., author of "A Di
ary of Chemistry," etc. With a colored plate, and one hundred and seventy-seve
trations. A new American, from the twelfth and enlarged London edition. Edit
ROBERT BRIDGES, M.D. In one large royal 12mo. volume, of over 1000 p
cloth, $2 75; leather, $3 25. (*Just Ready.*)

Two careful revisions by Mr. Watts, since the appearance of the last American editi
"Fownes," have so enlarged the work that in England it has been divided into two volum
reprinting it, by the use of a small and exceedingly clear type, cast for the purpose, it has
found possible to comprise the whole, without omission, in one volume, not unhandy for stu
reference. The enlargement of the work has induced the American Editor to confine his ad
to the narrowest compass, and he has accordingly inserted only such discoveries as have be
nounced since the very recent appearance of the work in England, and has added the sta
in popular use to the Decimal and Centigrade systems employed in the original.

Among the additions to this edition will be found a very handsome colored plate, repr
a number of spectra in the spectroscope. Every care has been taken in the typographical
tion to render the volume worthy in every respect of its high reputation and extended u
though it has been enlarged by more than one hundred and fifty pages, its very moderat
will still maintain it as one of the cheapest volumes accessible to the chemical student.

This work, inorganic and organic, is complete in one convenient volume. In its earliest editions it was fully up to the latest advancements and theories of that time. In its present form, it presents, in a remarkably convenient and satisfactory manner, the principles and leading facts of the chemistry of *to-day*. Concerning the manner in which the various subjects are treated, much deserves to be said, and mostly, too, in praise of the book. A review of such a work as *Fownes's Chemistry* within the limits of a book-notice for a medical weekly is simply out of the question.—*Cincinnati Lancet and Clinic*, Dec. 14, 1878.

When we state that, in our opinion, the present edition sustains in every respect the high reputation which its predecessors have acquired and enjoyed, we express therewith our full belief in its intrinsic value as a text-book and work of reference.—*Am. Journ. of Pharm.*, Aug. 1878.

The conscientious care which has been bestowed upon it by the American and English editors renders it still, perhaps, the best book for the student and the practitioner who would keep alive the acquisitions of his student days. It has, indeed, reached a somewhat formidable magnitude with its more
thousand pages, but with less than this no fai
sentation of chemistry as it now is can be giv
type is small but very clear, and the sections
lucidly arranged to facilitate study and refe
Med and Surg. Reporter, Aug 3, 1878.

The work is too well known to America
to need any extended notice; suffice it to
the revision by the English editor has been
done, and that Professor Bridges has add
fresh and valuable matter, especially in t
ganic chemistry. The book has always b
vorite in this country, and in its new s
fair to retain all its former *prestige.—Bo
of Chemistry*, Aug. 1878.

It will be entirely unnecessary for us to
remarks relating to the general character of
Manual. For over twenty years it has held

ATTFIELD (JOHN), Ph.D.,

Professor of Practical Chemistry to the Pharmaceutical Society of Great Britain, &c.

CHEMISTRY, GENERAL, MEDICAL, AND PHARMACEUTI

including the Chemistry of the U. S. Pharmacopœia. A Manual of the General P
of the Science, and their Application to Medicine and Pharmacy. Eighth edition
by the author. In one handsome royal 12mo. volume of 700 pages, with illust
Cloth, $2 50; leather, $3 00. (*Just Ready.*)

We have repeatedly expressed our favorable opinion of this work, and on the appearance of a new edition of it, little remains for us to say, except that we expect this eighth edition to be as indispensable to us as the seventh and previous editions have been. While the general plan and arrangement have been adhered to, new matter has been added covering the observations made since the former edition The present differs from the preceding one chiefly in these alterations and in about ten pages of useful tables added in the appendix.—*Am. Jour. of Pharmacy*, May, 1879.

A standard work like Attfield's Chemistry need only be mentioned by its name, without further comments The present edition contains such alterations and additions as seemed necessary for the demonstration of the latest developments of chemical principles, and the latest applications of chemistry to pharmacy. The author has bestowed arduous labor on the revision, and the extent of the information thus introduced may be estimated from the fact that the index contains three hundred new references relating to additional material.—*Druggists' Circular and Chemical Gazette*. May, 1879.

This very popular and meritorious work has now reached its eighth edition, which fact speaks in the highest terms in commendation of its excellence. It has now become the principal text-book of chemistry in all the medical colleg
United States. The present edition conta
alterations and additions as seemed nece
the demonstration of the latest develop
chemical principles, and the latest applic
chemistry to pharmacy. It is scarcely n
for us to say that it exhibits chemistry in
sent advanced state.—*Cincinnati Medic*
April, 1879.

The popularity which this work has e
owing to the original and clear dispositio
facts of the science, the accuracy of the det
the omission of much which freights many
heavily without bringing corresponding in
to the reader. Dr. Attfield writes for stude
primarily for medical students; he alway
eye to the pharmacopœia and its officinal
tions; and he is continually putting the m
the text so that it responds to the questio
which each section is provided. Thus the
learns easily, and can always refresh and
knowledge.—*Med and Surg. Reporter*, Apri

We noticed only about two years and a h
the publication of the preceding edition,
marked upon the exceptionally valuable c
of the work. The work now includes the
the chemistry of the pharmacopœia of the
States, Great Britain, and India.—*New R*

LOXAM (C. L.),

Professor of Chemistry in King's College, London.

HEMISTRY, INORGANIC AND ORGANIC. From the Second London Edition. In one very handsome octavo volume, of 700 pages, with about 300 illustrations. Cloth, $4 00; leather, $5 00. (*Lately Issued.*)

e have in this work a complete and most excel- xt-book for the use of schools, and can heart- mmend it as such.—*Boston Med. and Surg.* r., May 28, 1874.

above is the title of a work which we can most ationsly recommend to students of chemis- It is as easy as a work on chemistry could be , at the same time that it presents a full account science as it now stands. We have spoken work as admirably adapted to the wants of nts; it is quite as well suited to the require- of practitioners who wish to review their try, or have occasion to refresh their memo- any point relating to it. In a word, it is a be read by all who wish to know what is mistry of the present day.—*American Prac r*, Nov. 1873.

It would be difficult for a practical chemist and teacher to find any material fault with this most admirable treatise. The author has given us almost a cyclopædia within the limits of a convenient volume, and has done so without penning the *useless* paragraphs too commonly making up a great part of the bulk of many cumbrous works. The progressive scientist is not disappointed when he looks for the record of new and valuable processes and discoveries, while the cautious conservative does not find its pages monopolized by uncertain theories and speculations. A peculiar point of excellence is the crystallized form of expression in which great truths are expressed in very short paragraphs. One is surprised at the brief space allotted to an important topic, and yet, after reading it, he feels that little, if any more should have been said. Altogether, it is seldom you see a text-book so nearly faultless. — *Cincinnati Lancet* Nov. 1873.

WES (FRANK), D.Sc., London.

Senior Science-Master at the High School, Newcastle-under-Lyme, etc.

ELEMENTARY TREATISE ON PRACTICAL CHEMISTRY AND QUALITATIVE INORGANIC ANALYSIS. Specially adapted for Use in the Laboratories of Schools and Colleges and by Beginners. From the Second and Revised English Edition, with about fifty illustrations on wood. In one very handsome royal 12mo. volume of 372 pages: cloth. $2 50. (*Now Ready.*)

hort, concise, and eminently practical. We heartily commend it to students, and espe- those who are obliged to dispense with a . Of course, a teacher is in every way desi- t a good degree of technical skill and prac- owledge can be attained with no other r than the very valuable handbook now consideration.—*St Louis Clin. Record*, Oct.

rk is so written and arranged that it can be eeded by the student without a teacher, and riptions and directions for the various work are so simple, and yet concise, as to be interesting and intelligible. The work is unincumbered with theoretical deductions, dealing wholly with the practical matter, which it is the aim of this comprehensive text-book to impart. The accuracy of the analytical methods are vouched for from the fact that they have all been worked through by the author and the members of his class, from the printed text. We can heartily recommend the work to the student of chemistry as being a reliable and comprehensive one.—*Druggists' Advertiser*, Oct. 15, 1877.

'S TECHNOLOGY; or Chemistry Applied to Arts, and to Manufactures. With American ions by Prof. WALTER R. JOHNSON. In two very handsome octavo volumes, with 500 wood engravings, cloth, $6 00.

RRISH (EDWARD),

Late Professor of Materia Medica in the Philadelphia College of Pharmacy.

TREATISE ON PHARMACY. Designed as a Text-Book for the Student, and as a Guide for the Physician and Pharmaceutist. With many Formulæ and escriptions. Fourth Edition, thoroughly revised, by THOMAS S. WIEGAND. In one ndsome octavo volume of 977 pages, with 280 illustrations; cloth, $5 50; leather, $6 50. (*ately Issued.*)

Parrish's great work on pharmacy it only o be said that the editor has accomplished so well as to maintain, in this fourth edi- high standard of excellence which it had in previous editions, under the editorship of plished author. This has not been accom without much labor, and many additions and ments, involving changes in the arrange- the several parts of the work, and the addi- much new-matter. With the modifications ted it constitutes, as now presented, a com- of the science and art indispensable to the cist, and of the utmost value to every ner of medicine desirous of familiarizing with the pharmaceutical preparation of the which he prescribes for his patients.—*Chi- Med. Journ.*, July, 1874.

work is eminently practical, and has the rare f being readable and interesting, while it pre- strictly scientific character. The whole work the greatest credit on author, editor and pub It will convey some idea of the liberality which bestowed upon its production when we men- t there are no less than 280 carefully executed ations. In conclusion, we heartily recommend the work, not only to pharmacists, but also to the multitude of medical practitioners who are obliged to compound their own medicines. It will ever hold an honored place on our own bookshelves.—*Dublin Med. Press and Circular*, Aug. 12, 1874.

We expressed our opinion of a former edition in terms of unqualified praise, and we are in no mood to detract from that opinion in reference to the present edition, the preparation of which has fallen into competent hands. It is a book with which no pharmacist can dispense, and from which no physician can fail to derive much information of value to him in practice.—*Pacific Med. and Surg. Journ.*, June, '74.

Perhaps one, if not the most important book upon pharmacy which has appeared in the English language has emanated from the transatlantic press. "Parrish's Pharmacy" is a well-known work on this side of the water, and the fact shows us that a really useful work never becomes merely local in its fame. Thanks to the judicious editing of Mr. Wiegand, the posthumous edition of "Parrish" has been saved to the public with all the mature experience of its author, and perhaps none the worse for a dash of new blood.—*Lond. Pharm. Journal*, Oct. 17, 1874.

FARQUHARSON (ROBERT), M.D.,

Lecturer on Materia Medica at St. Mary's Hospital Medical School.

A GUIDE TO THERAPEUTICS AND MATERIA MEDICA.

**cond American edition, revised by the Author. Enlarged and adapted to the
Pharmacopœia. By FRANK WOODBURY, M.D. In one neat royal 12mo. volume
pages: cloth, $2.25. (*Just Ready.*)**

The appearance of a new edition of this convenient and handy book in less than two years may certainly be taken as an indication of its usefulness. Its convenient arrangement, and its terseness, and, at the same time, completeness of the information given, make it a handy book of reference.—*Am. Journ. of Pharmacy*, June, 1879.

The early appearance of a second edition of Dr. Farquharson's work bears sufficient testimony to the appreciation of it by American readers. The plan is such as to bring the character and action of drugs to the eye and mind with clearness. The care with which both author and editor have done their work is conspicuous on every page.—*Med. and Surg. Reporter*, May 31, 1879.

This work contains in moderate compass such well-digested facts concerning the physiological and therapeutical action of remedies as are reasonably established up to the present time. By a convenient arrangement the corresponding effects of each article in health and disease are prese
parallel columns, not only rendering re
easier, but also impressing the facts more st
upon the mind of the reader. The book h
adapted to the wants of the American stud
copious notes have been introduced, embody
latest revision of the Pharmacopœia, togeth
the antidotes to the more prominent pois
such of the newer remedial agents as seem
sary to the completeness of the work. T
weights and measures, and a good alphabe
dex end the volume.—*Druggists' Circul
Chemical Gazette*, June, 1879.

It is a pleasure to think that the rapid
which a second edition is demanded may
as an indication that the sense of apprecia
value of reliable information regarding th
remedies is not entirely overwhelmed in the
tion of pathological studies, characteristic o
sent day. This work certainly merits the
has so quickly achieved.—*New Remedies*,

STILLÉ (ALFRED), M.D.,

Professor of Theory and Practice of Medicine in the University of Penna.

THERAPEUTICS AND MATERIA MEDICA; a Systematic T

**on the Action and Uses of Medicinal Agents, including their Description and
Fourth edition, revised and enlarged. In two large and handsome 8vo. vols. of a
pages. Cloth, $10; leather, $12. (*Lately Issued.*)**

It is unnecessary to do much more than to announce the appearance of the fourth edition of this well known and excellent work.—*Brit. and For. Med.-Chir. Review*, Oct. 1875.

For all who desire a complete work on therapeutics and materia medica for reference, in cases involving medico-legal questions, as well as for information concerning remedial agents, Dr. Stillé's is "*par excellence*" the work. The work being out of print, by the exhaustion of former editions, the author has laid the profession under renewed obligations, by the careful revision, important additions, and timely reissuing a work not exactly supplemented by any other in the English language, if in any language. The mechanical execution handsomely sustains the well-known skill and good taste of the publisher.—*St. Louis Med. and Surg. Journal*, Dec. 1874.

From the publication of the first edition "Stillé's Therapeutics" has been one of the classics; its absence from our libraries would create a vacuum which could be filled by no other work in the language, and its presence supplies, in the two volumes of the present edition, a whole cyclopædia
peutics.—*Chicago Medical Journal*, Feb.

The rapid exhaustion of three editions a
versal favor with which the work has bee
by the medical profession, are sufficient p
excellence as a repertory of practical and
formation for the physician. The edition
fully sustains this verdict, as the work has
fully revised and in some portions rewritt
ing it up to the present time by the ad
chloral and croton-chloral, nitrite of amy
ride of methylene, methylic ether, lith
pounds, gelseminum, and other remed
Journ. of Pharmacy, Feb. 1875.

We can hardly admit that it has a riv
multitude of its citations and the fulness
search into clinical histories, and we must
a place in the physician's library; not, i
fully representing the present state of kno
pharmacodynamics, but as by far the mos
treatise upon the clinical and practical s
question.—*Boston Med. and Surg. Journ
1874.*

GRIFFITH (ROBERT E.), M.D.

A UNIVERSAL FORMULARY, Containing the Methods of

**ing and Administering Officinal and other Medicines. The whole adapted to Physi
Pharmaceutists. Third edition, thoroughly revised, with numerous additions, by
MAISCH, Professor of Materia Medica in the Philadelphia College of Pharmacy. In
and handsome octavo volume of about 800 pp., cl., $4 50; leather, $5 50. (*Latel***

To the druggist a good formulary is simply indispensable, and perhaps no formulary has been more extensively used than the well-known work before us. Many physicians have to officiate, also, as druggists. This is true especially of the country physician, and a work which shall teach him the means by which to administer or combine his remedies in the most efficacious and pleasant manner, will always hold its place upon his shelf. A formulary of this kind is of benefit also to the city physician in largest practice.—*Cincinnati Clinic*, Feb. 21, 1874.

A more complete formulary than it is i
ent form the pharmacist or physician cou
desire. To the first some such work is i
ble, and it is hardly less essential to the p
who compounds his own medicines. Mu
is contained in the introduction ought t
mitted to memory by every student of

MAISCH (JOHN M.), Ph.D.,
Prof. of Mat. Med. and Bot. in Phila.
Coll. Pharmacy, Secy. to the American
Pharmaceutical Association.

HE NATIONAL DISPENSATORY: Containing the Natural History,

Chemistry, Pharmacy, Actions and Uses of Medicines, including those recognized in the Pharmacopœias of the United States, Great Britain, and Germany, with numerous references to the French Codex. Second edition, thoroughly revised, with numerous additions. In one very handsome octavo volume of 1692 pages, with 239 illustrations. Extra cloth, $6 75; leather, raised bands, $7 50. (*Now Ready*)

PREFACE TO THE SECOND EDITION.

e demand which has exhausted in a few months an unusually large edition of the National
ensatory is doubly gratifying to the authors, as showing that they were correct in thinking
the want of such a work was felt by the medical and pharmaceutical professions, and that
efforts to supply that want have been acceptable. This appreciation of their labors has
ulated them in the revision to render the volume more worthy of the very marked favor
which it has been received. The first edition of a work of such magnitude must necessarily
re or less imperfect; and though but little that is new and important has been brought
t in the short interval since its publication, yet the length of time during which it was
g through the press rendered the earlier portions more in arrears than the latter. The
unity for a revision has enabled the authors to scrutinize the work as a whole, and to
ce alterations and additions wherever there has seemed to be occasion for improve-
r greater completeness. The principal changes to be noted are the introduction of seve-
gs under separate headings, and of a large number of drugs, chemicals, and pharma-
l preparations classified as allied drugs and preparations under the heading of more
tant or better known articles: these additions comprise in part nearly the entire German
acopœia and numerous articles from the French Codex. All new investigations which
to the authors' notice up to the time of publication have received due consideration.
series of illustrations has undergone a corresponding thorough revision. A number have
dded, and still more have been substituted for such as were deemed less satisfactory.
new matter embraced in the text is equal to nearly one hundred pages of the first edition.
rable as are these changes as a whole, they have been accommodated by an enlargement
page without increasing unduly the size of the volume.
le numerous additions have been made to the sections which relate to the physiological
of medicines and their use in the treatment of disease, great care has been taken to
them as concise as was possible without rendering them incomplete or obscure. The
have been expressed in the terms both of troy weight and of the metrical system, for the
of making those who employ the Dispensatory familiar with the latter, and paving the
r its introduction into general use.
Therapeutical Index has been extended by about 2250 new references, making the total
r in the present edition about 6000.
articles there enumerated as remedies for particular diseases are not only those which,
authors' opinion, are curative, or even beneficial, but those also which have at any time
employed on the ground of popular belief or professional authority. It is often of as
consequence to be acquainted with the worthlessness of certain medicines or with the
limits of their power, as to know the well attested virtues of others and the conditions
which they are displayed. An additional value possessed by such an Index is, that it
s the elements of a natural classification of medicines, founded upon an analysis of the
of experience, which is the only safe guide in the treatment of disease.

evidence of success, seldom paralleled,
early how well the authors have met the
needs of the pharmaceutical and medical
s. Gratifying as it must be to them, they
raced the opportunity offered for a thor-
sion of the whole work, striving to em-
thin it all that might have been omitted in
r edition, and all that has newly appeared
ent importance during the time of its col-
n, and the short interval elapsed since the
publication. After having gone carefully
the volume we must admit that the authors
bored faithfully, and with success, in main-
the high character of their work as a com-
meeting the requirements of the day, to
one can safely turn in quest of the latest in-
ion concerning everything worthy of notice in
tion with Pharmacy, Materia Medica, and
peutics.—*Am. Jour. of Pharmacy*, Nov. 1879.

with great pleasure that we announce to our
s the appearance of a *second* edition of the
al Dispensatory. The total exhaustion of the
dition in the short space of six months, is a
nt testimony to the value placed upon the
by the profession. It appears that the rapid
f the first edition must have induced both the
s and the publisher to make preparations for
edition immediately after the first had been
, for we find a large amount of new matter
and a good deal of the previous text altered
improved, which proves that the authors do not intend to let the grass grow under their feet, but to keep the work up to the time.—*New Remedies*, Nov. 1879.

This is a great work by two of the ablest writers on materia medica in America. The authors have produced a work which, for accuracy and comprehensiveness, is unsurpassed by any work on the subject. There is no book in the English language which contains so much valuable information on the various articles of the materia medica. The work has cost the authors years of laborious study, but they have succeeded in producing a dispensatory which is not only *national*, but will be a lasting memorial of the learning and ability of the authors who produced it.—*Edinburgh Medical Journal*, Nov. 1879.

A new edition of this great work, only a few months after the first, takes us by surprise. It indicates the high appreciation of its value on the part of physicians and pharmacists, by which a large edition has been so soon exhausted. The present is not merely a reprint but a revision, with important additions and modifications, requiring 100 pages of new matter, and an index increased by 2250 references. The doses are stated in both the ordinary and metric terms. All the more important material of the German and French Pharmacopœias is embodied. It is by far more international or universal than any other book of the kind in our language, and more comprehensive in every sense.—*Pacific Med. and Surg. Journ.*, Oct. 1879.

CORNIL (V.), AND RANVIER (L.).

Prof. in the Faculty of Med., Paris. *Prof in the College of France.*

MANUAL OF PATHOLOGICAL HISTOLOGY. Translated,

Notes and Additions, by E. O. SHAKESPEARE, M.D., Pathologist and Ophthalmic S
to Philada. Hospital, Lecturer on Refraction and Operative Ophthalmic Surgery in
of Penna., and by HENRY C. SIMES. M D., Demonstrator of Pathological Histol
the Univ. of Pa. In one very handsome octavo volume of over 700 pages, wi
350 illustrations. Cloth, $5 50; leather, $6 50. (*Just Ready.*)

The work of Cornil and Ranvier is so well known as a lucid and accurate text-book
important subject, that no apology is needed in presenting a translation of it to the A
profession. It is only necessary to say that the labors of Drs. Shakespeare and Sime
been by no means confined to the task of rendering the work into English. As it appe
France, in successive portions, between 1868 and 1876, a part of it, at least, was some
arrears of the present state of science, while the diffuseness of other portions rendered
sation desirable. The translators have, therefore, sought to bring the work up to t
and, at the same time, to reduce it in size, as far as practicable, without impairing i
pleteness. These changes will be found throughout the volume, the most extensive b
the sections devoted to Sarcoma, Carcinoma, Tuberculosis, the Bloodvessels, the Mam
the classification of tumors. Corresponding modifications have been made in the very
sive and beautiful series of illustrations, and every care has been taken in the typog
execution to render it one of the most attractive volumes which have issued from the A
press.

WATSON (THOMAS), M.D., &c.

LECTURES ON THE PRINCIPLES AND PRACTIC

PHYSIC. Delivered at King's College, London. A new American, from the F
vised and enlarged English edition. Edited, with additions, and several hundred
tions, by HENRY HARTSHORNE, M.D., Professor of Hygiene in the University of
sylvania. In two large and handsome 8vo. vols. Cloth, $9 00; leather, $11 00. (

LINT (*AUSTIN*), *M.D.*,

Professor of the Principles and Practice of Medicine in Bellevue Med. College, N. Y.

A TREATISE ON THE PRINCIPLES AND PRACTICE OF

MEDICINE; designed for the use of Students and Practitioners of Medicine. Fourth edition, revised and enlarged. In one large and closely printed octavo volume of about 1100 pp.; cloth, $6 00; or strongly bound in leather, with raised bands, $7 00. (*Lately Issued.*)

y common consent of the English and American medical press, this work has been assigned highest position as a complete and compendious text-book on the most advanced condi- f medical science. At the very moderate price at which it is offered it will be found one cheapest volumes now before the profession.

excellent treatise on medicine has acquired f in the United States a reputation similar to joyed in England by the admirable lectures Thomas Watson. We have referred to many most important chapters, and find the revi- ken of in the preface is a genuine one, and author has very fairly brought up his matter vel of the knowledge of the present day. The this great recommendation, that it is in one , and therefore will not be so terrifying to the as the bulky volumes which several of our text-books of medicine have developed into. *and Foreign Med.-Chir. Rev.*, Jan. 1875

course unnecessary to introduce or eulogize standard treatise. The present edition enlarged and revised to bring it up to the present level of experience and reading. His own clinical studies and the latest contributions to medical literature both in this country and in Europe, have received careful attention, so that some portions have been entirely rewritten, and about seventy pages of new matter have been added.—*Chicago Med. Jour.*, June, 1873.

Has never been surpassed as a text-book for students and a book of ready reference for practitioners. The force of its logic, its simple and practical teachings, have left it without a rival in the field. *N. Y.—Med Record*, Sept. 15, 1874.

It is given to very few men to tread in the steps of Austin Flint, whose single volume on medicine, though here and there defective, is a masterpiece of lucid condensation and of general grasp of an enormously wide subject —*Lond. Practitioner*, Dec.'7.

SAME AUTHOR.

CLINICAL MEDICINE; a Systematic Treatise on the Diagnosis

nd Treatment of Diseases. Designed for Students and Practitioners of Medicine. In e large and handsome octavo volume of 795 pages; cloth, $4 50; leather, $5 50. (*Now Ready.*)

re that the skill and learning of the great are displayed He has given us a store- f medical knowledge, excellent for the stu- venient for the practitioner, the result of a of the most faithful clinical work, collect- energy as vigilant and systematic as un- and weighed by a judgment no less clear observation is close.—*Archives of Medi-* . 1879

uthor of the above work has anticipated a g felt by those for whom it was especially —the clinical student during his pupilage, busy practitioner. He has given to the profession a very necessary and useful mplete in detail, accurate in observation, statement.—*St. Louis Courier of Med.*,

is every reason to believe that this book well received. The active practitioner is ly in need of some work that will enable obtain information in the diagnosis and t of cases with comparatively little labor. has the faculty of expressing himself clearly, and at the same time so concisely as to enable the searcher to traverse the entire ground of his search, and at the same time obtain all that is essential, without plodding through an interminable space.—*N. Y. Med. Jour.*, Nov. 1879

The eminent teacher who has written the volume under consideration has recognized the needs of the American profession, and the result is all that we could wish. The style in which it is written is peculiarly the author's; it is clear and forcible, and marked by those characteristics which have rendered him one of the best writers and teachers this country has ever produced. We have not space for so full a consideration of this remarkable work as we would desire.—*S. Louis Clin. Record*, Oct. 1879.

It is venturing little to say that there are few men so well fitted as Dr Flint to impart information on these last mentioned subjects, and the present work is a timely one as relates both to the author's capacity to undertake it and the need for it as an accompaniment to the multitude now issued, in which the subject of treatment is but little considered.—*New Remedies*, Nov. 1879.

SAME AUTHOR.

ENTIALS OF THE PRINCIPLES AND PRACTICE OF MEDI-

CINE. A handy-book for Students and Practitioners. Fourth edition, revised and improved. With about one hundred illustrations. In one handsome royal 12mo volume, of about 550 pages, cloth, $2 63; half bound, $2 88. (*Lately Issued.*)

handbook, which clearly sets forth the ESSEN- of the PRINCIPLES AND PRACTICE OF MEDICINE, not know of its equal. — *Va. Med. Monthly.*

brief, condensed, but comprehensive handbook, it cannot be improved upon.—*Chicago Med. Examiner*, Nov. 15, 1874.

Without doubt the best book of the kind published in the English language.—*St. Louis Med. and Surg. Journ.*, Nov. 1874.

VIS (*NATHAN S.*),

Prof. of Principles and Practice of Medicine, etc., in Chicago Med. College.

CLINICAL LECTURES ON VARIOUS IMPORTANT DISEASES;

being a collection of the Clinical Lectures delivered in the Medical Wards of Mercy Hospital, Chicago. Edited by FRANK H. DAVIS, M.D. Second edition, enlarged. In one handsome royal 12mo. volume. Cloth, $1 75. (*Lately Issued.*)

BRISTOWE (JOHN SYER), M.D., F.R.C.P.,
Physician and Joint Lecturer on Medicine, St. Thomas's Hospital.

A TREATISE ON THE PRACTICE OF MEDICINE.

Second American edition, revised by the Author. Edited, with Additions, by JAMES H. HUTCHINSON, M.D., Physician to the Penna. Hospital. In one handsome octavo volume of nearly 1200 pages. With illustrations. Cloth, $5 50; leather, $6 50. (*Just Ready.*)

In reprinting this work from the recent thoroughly revised second English edition, the author has made such corrections as seemed advisable, and has added a chapter on Insanity. The Editor has likewise revised his additions in the light of the latest experience, and the work is presented as reflecting in every way the most modern aspect of medical science, and as fully entitled to maintain the distinguished position accorded to it on both sides of the Atlantic as an authoritative guide for the student, and a complete though concise book of reference for the practitioner. Notwithstanding the author's earnest effort at compression, the additions have amounted to about one-tenth of the previous edition; but by the use of an enlarged page these have been accommodated without increasing the size of the volume, while a reduction in the price renders it one of the cheapest works accessible to the profession.

A few notices of the first edition are subjoined.

A new edition of this well-known work, which has had the advantage of careful revision not only by its author but also by Dr Hutchinson, than whom there is no one in this country better fitted for the task.—*Phila. Med. Times*, Jan. 3, 1880.

The popularity of the work depends, no doubt, upon the clear and incisive way in which it is written, and the attention to details likely to occur in practice, rather than the discussion of questions of theory.—*New Remedies*, Jan. 1880.

What we said of the first edition, we can, with increased emphasis, repeat concerning this: "Every page is characterized by the utterances of a thoughtful man. What has been said, has been well said, and the book is a fair reflex of all that is *certainly known* on the subjects considered."—*Ohio Med. Recorder*, Jan. 7, 1880.

This is not only one of the latest and most comprehensive works out on the general subject of Theory and Practice of Medicine, but it is unquestionably one of the best.—*So. Med. Practitioner*, Jan. 1880.

WOODBURY (FRANK), M.D.,
Physician to the German Hospital, Philadelphia, late Chief Assist. to Med. Clinic, Jef. College Hospital, etc.

A HANDBOOK OF THE PRINCIPLES AND PRACTICE OF

Medicine; for the use of Students and Practitioners. Based upon Husband's Handbook of Practice. In one neat volume, royal 12mo. (*In Press.*)

HABERSHON (S. O.). M.D.
Senior Physician to and late Lecturer on the Principles and Practice of Medicine at Guy's Hospital, etc.

ON THE DISEASES OF THE ABDOMEN, COMPRISING THOSE

of the Stomach, and other parts of the Alimentary Canal, Œsophagus, Cæcum, Intestines, and Peritoneum. Second American, from the third enlarged and revised English edition. With illustrations. In one handsome octavo volume of over 500 pages. Cloth, $3 50. (*Now Ready.*)

We can do very little to add to the favorable reception which has already been given by the medical press of the world to this well known treatise We commend to all practitioners a careful perusal of Dr. Habershon's work More especially, we draw attention to the number of intestinal diseases recorded in its pages, cases of extreme interest clinically and pathologically. This careful record shows that the work is no compilation, but a careful exposition of the author's personal experience.—*Canadian Med. and Surg. Journ.*, May, 1879.

This valuable treatise on diseases of the stomach and abdomen has been out of print for several years, and is therefore not so well known to the profession as it deserves to be. It will be found a cyclopædia of information, systematically arranged, on all diseases of the alimentary tract, from the mouth to the rectum. A fair proportion of each chapter is devoted to symptoms, pathology, and therapeutics. The present edition is fuller than former ones in many particulars, and has been thoroughly revised and amended by the author. Several new chapters have been added, bringing the work fully up to the times, and making it a volume of interest to the practitioner in every field of medicine and surgery. Perverted nutrition is in some form associated with all diseases we have to combat, and we need all the light that can be obtained on a subject so broad and general. Dr Habershon's work is one that every practitioner should read and study for himself.—*N. Y. Med. Journ.*, April, 1879.

FOTHERGILL (J. MILNER), M.D. Edin., M.R.C.P. Lond.,
Asst. Phys. to the West Lond. Hosp.; Asst. Phys. to the City of Lond. Hosp., etc.

THE PRACTITIONER'S HANDBOOK OF TREATMENT; Or, the

Principles of Therapeutics. In one very neat octavo volume of about 550 pages: cloth, $4 00. (*Now Ready.*)

Our friends will find this a very readable book; and that it sheds light upon every theme it touches, causing the practitioner to feel more certain of his diagnosis in difficult cases. We confidently commend the work to our readers as one worthy of careful perusal. It lights the way over obscure and difficult passes in medical practice. The chapter on the circulation of the blood is the most exhaustive and instructive to be found. It is a book every practitioner needs, and would have, if he knew how suggestive and helpful it would be to him.—*St. Louis Med. and Surg. Journ.*, April, 1877.

We heartily commend his book to the medical student as an honest and intelligent guide through the mazes of therapeutics, and assure the practitioner who has grown gray in the harness that he will derive pleasure and instruction from its perusal. Valuable suggestions and material for thought abound throughout.—*Boston Med. and Surg. Journal*, Mar. 8, 1877.

BY THE SAME AUTHOR.

THE ANTAGONISM OF THERAPEUTIC AGENTS, AND WHAT

IT TEACHES. Being the Fothergillian Prize Essay for 1878. In one neat volume, royal 12mo. of 156 pages; cloth, $1 00. (*Just Ready.*)

EYNOLDS (J. RUSSELL), M.D.,

Prof. of the Principles and Practice of Medicine in Univ. College, London.

SYSTEM OF MEDICINE. With Notes and Additions by Henry Hartshorne, M.D., late Professor of Hygiene in the University of Penna. In three large and handsome octavo volumes, containing about 3000 closely printed double-columned pages, with numerous illustrations. Sold only by subscription. Price per vol., in cloth, $5.00; in leather, $6.00.

ME I. (*just ready*) contains General Diseases and Diseases of the Nervous System.
ME II. (*just ready*) contains Diseases of Respiratory and Circulatory Systems.
ME III. (*preparing for early publication*) will contain Diseases of the Digestive and
Blood Glandular Systems, of the Urinary Organs, of the Female Reproductive
System, and of the Cutaneous System.

ynolds's System of Medicine, recently completed, has acquired, since the first appearance
e first volume, the well-deserved reputation of being the work in which modern British
cine is presented in its fullest and most practical form. This could scarce be otherwise in
of the fact that it is the result of the collaboration of the leading minds of the profession,
subject being treated by some gentleman who is regarded as its highest authority—as for
nce, Diseases of the Bladder by Sir Henry Thompson, Malpositions of the Uterus by
y Hewitt, Insanity by Henry Maudsley, Consumption by J. Hughes Bennet, Dis-
of the Spine by Charles Bland Radcliffe, Pericarditis by Francis Sibson, Alcoholism
ncis E. Anstie, Renal Affections by William Roberts, Asthma by Hyde Salter,
al Affections by H. Charlton Bastian, Gout and Rheumatism by Alfred Baring Gar-
Constitutional Syphilis by Jonathan Hutchinson, Diseases of the Stomach by Wilson
Diseases of the Skin by Balmanno Squire, Affections of the Larynx by Morell Mac-
, Diseases of the Rectum by Blizard Curling, Diabetes by Lauder Brunton, Intes-
iseases by John Syer Bristowe, Catalepsy and Somnambulism by Thomas King Cham-
Apoplexy by J. Hughlings Jackson, Angina Pectoris by Professor Gairdner, Emphy-
f the Lungs by Sir William Jenner, etc. etc. All the leading schools in Great Britain
ntributed their best men in generous rivalry, to build up this monument of medical sci-
St. Bartholomew's, Guy's, St. Thomas's, University College, St. Mary's in London, while
burgh, Glasgow, and Manchester schools are equally well represented, the Army Medical
at Netley, the military and naval services, and the public health boards. That a work
d in such a spirit, and carried out under such auspices should prove an indispensable
of facts and experience, suited to the daily wants of the practitioner, was inevitable, and
ess which it has enjoyed in England, and the reputation which it has acquired on this
he Atlantic, have sealed it with the approbation of the two pre-eminently practical nations.
large size and high price having kept it beyond the reach of many practitioners in this
y who desire to possess it, a demand has arisen for an edition at a price which shall ren-
ccessible to all. To meet this demand the present edition has been undertaken. The
mes and five thousand pages of the original will, by the use of a smaller type and double
, be compressed into three volumes of about three thousand pages, clearly and hand-
printed, and offered at a price which will render it one of the cheapest works ever pre-
o the American profession.
not only will the American edition be more convenient and lower priced than the English;
also be better and more complete. Some years having elapsed since the appearance of a
of the work, additions will be required to bring up the subjects to the existing condition
e. Some diseases, also, which are comparatively unimportant in England, require more
e treatment to adapt the articles devoted to them to the wants of the American physi-
and there are points on which the received practice in this country differs from that
abroad. The supplying of these deficiencies has been undertaken by Henry Harts-
M.D., late Professor of Hygiene in the University of Pennsylvania, who will endeavor
the work fully up to the day, and as useful to the American physician as it has proved
his English brethren. The number of illustrations will also be largely increased, and
will be spared to render the typographical execution unexceptionable in every respect.
and second volumes are now ready, and the completion of the whole may be expected

o much praise can scarcely be given to
book. It is a cyclopædia of medicine
by some of the best men of Europe. It is
seful information such as one finds frequent
in one's daily work; for no one head can
carry all the knowledge one needs in gen-
tice, and one must refer sometimes to one's
. As a book of reference it is invaluable. It
th the times. It is clear and concentrated
, and its form is worthy of its famous pub-
—*Louisville Med. News*, Jan. 31, 1880.

olds' System of Medicine" is justly con-
the most popular work on the principles and
of medicine in the English language The
tors to this work are gentlemen of well-
reputation on both sides of the Atlantic.
tleman has striven to make his part of the
practical as possible, and the information
d is such as is needed by the busy practi-
.—*St. Louis Med. and Surg. Journ.*, Jan. 20,

Hartshorne has made ample additions and re-
so far, all of which give increased value to
ume, and render it more useful to the Ameri-
titioner. There is no volume in English
al literature more valuable, and every pur-
will, on becoming familiar with it, congrat-
himself on the possession of this vast storehouse of information, in regard to so many of the subjects with which he should be familiar.—*Gaillard's Med. Journ.*, Feb. 1880.

There is no medical work which we have in times past more frequently and fully consulted when perplexed by doubts as to treatment, or by having unusual or apparently inexplicable symptoms presented to us than "Reynolds' System of Medicine." Among its contributors are gentlemen who are as well known by reputation upon this side of the Atlantic as in Great Britain, and whose right to speak with authority upon the subjects about which they have written, is recognized the world over. They have evidently striven to make their essays as practical as possible, and while these are sufficiently full to entitle them to the name of monographs, they are not loaded down with such an amount of detail as to render them wearisome to the general reader. In a word, they contain just that kind of information which the busy practitioner frequently finds himself in need of. In order that any deficiencies may be supplied, the publishers have committed the preparation of the book for the press to Dr. Henry Hartshorne, whose judicious notes distributed throughout the volume afford abundant evidence of the thoroughness of the revision to which he has subjected it.—*Am. Jour. Med. Sciences*, Jan. 1880.

FINLAYSON (JAMES), M.D.,

Physician and Lecturer on Clinical Medicine in the Glasgow Western Infirmary, etc.

CLINICAL DIAGNOSIS; A Handbook for Students and Practitioners of Medicine. In one handsome 12mo. volume, of 546 pages, with 85 illustrations. Cloth, $2 63. (*Just Ready.*)

The book is an excellent one, clear, concise, convenient, practical. It is replete with the very knowledge the student needs when he quits the lecture-room and the laboratory for the ward and sick-room, and does not lack in information that will meet the wants of experienced and older men.—*Phila. Med. Times*, Jan. 4, 1879.

The aim of the author is to teach a student and practitioner how to examine a case so as to use "*all his knowledge*" in arriving at a diagnosis. All the various symptoms of the several systems are grouped together in such a manner as to make their relations to a final diagnosis clear and easy of apprehension. This work has been done by men of large experience and trained observation, who have been long recognized as authorities upon the subjects which they treat. There is a profusion of illustrations to illustrate subjects under discussion. The application of electricity, and instruments of precision in diagnosis, is fully discussed. This book is all good. We commend it to all students and practitioners of medicine as a work worthy of a place in their libraries.—*Ohio Med. Recorder*, Dec. 1878.

This is one of the really useful books. It is attractive from preface to the final page, and ought to be given a place on every office table, because it contains in a condensed form all that is valuable in semeiology and diagnostics to be found in bulkier volumes, and because in its arrangement and complete index, it is unusually convenient for quick reference in any emergency that may come upon the busy practitioner. —*N. C. Med. Journ.*, Jan. 1879.

HAMILTON (ALLAN McLANE), M.D.,

Attending Physician at the Hospital for Epileptics and Paralytics, Blackwell's Island, N.Y., and at the Out-Patients' Department of the New York Hospital.

NERVOUS DISEASES; THEIR DESCRIPTION AND TREATMENT. In one handsome octavo volume of 512 pages, with 53 illus.; cloth, $3 50. (*Now Ready.*)

This is unquestionably the best and most complete text-book of nervous diseases that has yet appeared, and were international jealousy in scientific affairs at all possible, we might be excused for a feeling of chagrin that it should be of American parentage. This work, however, has been performed in New York, and has been so well performed that no room is left for anything but commendation. With great skill, Dr. Hamilton has presented to his readers a succinct and lucid survey of all that is known of the pathology of the nervous system, viewed in the light of the most recent researches. From the preliminary description of the methods of examination and study, and of the instruments of precision employed in the investigation of nervous diseases, up till the final collection of formulæ, the book is eminently practical. — *Brain*, London, Oct. 1878.

The author tells us in his preface that it has been his object to produce a concise, practical book, and we think he has been successful, considering the extent of the subject which he has undertaken. In fact, it is more extensive than the title properly or accurately indicates, embracing—besides what are usually regarded as nervous diseases—inflammatory affections, both acute and chronic, hemorrhages and tumors of the cerebrum and cerebellum, medulla oblongata, spinal cord and nerves, with thrombosis and embolism of the arteries, sinuses, and veins. The reader may therefore expect information, more or less full and satisfactory, on almost every point connected with the nervous system. We have no hesitation in saying that reliance may be placed on Dr. Hamilton's conscientious performance of his self-assigned task, on his soundness of judgment, and freedom from empiricism.—*Edinburgh Med. Journ.*, Oct. 1878.

From a very careful examination of the whole work, we can justly say that the author has not only clearly and fully treated of diagnosis and treatment, but, unlike most works of this class, it is very comprehensive in regard to etiology, and exposes the pathology of nervous diseases in the light of the very latest experiments and discoveries. The drawings are excellent and well selected. After this careful revision, we can heartily recommend this work to students and general practitioners in particular as being a full exposition of diseases of the nervous system, their pathology and treatment, to date.—*N. Y. Med. Record*, Aug. 3, 1878.

CHARCOT (J. M.),

Professor to the Faculty of Med. Paris, Phys. to La Salpêtrière, etc.

LECTURES ON DISEASES OF THE NERVOUS SYSTEM. Translated from the Second Edition by GEORGE SIGERSON, M.D., M.Ch., Lecturer on Biology, etc., Cath. Univ. of Ireland. With illustrations. 1 vol. 8vo. of 288 pages. Cloth, $1 75. (*Just Ready.*)

CLINICAL OBSERVATIONS ON FUNCTIONAL NERVOUS DISORDERS By C. HANDFIELD JONES, M.D., Physician to St. Mary's Hospital, &c. Second American Edition. In one handsome octavo volume of 348 pages, cloth, $3 25.

FOX (TILBURY), M.D., F.R.C.P., and T. C. FOX, B.A., M.R.C.S.,

Physician to the Department for Skin Diseases, University College Hospital.

EPITOME OF SKIN DISEASES. WITH FORMULÆ. FOR STUDENTS AND PRACTITIONERS. Second edition, thoroughly revised and greatly enlarged. In one very handsome 12mo. volume of 216 pages. Cloth, $1 38. (*Just Ready.*)

The names of the authors are quite sufficient to commend this book, Dr. Tilbury Fox being well known as occupying a place in the front rank of dermatologists of the day.—*Canadian Journal of Med. Sci.*, May, 1878.

The present edition of the Epitome considerably exceeds in size, and surpasses in use, its predecessor. The work is certainly a valuable addition to the "handy volume" department of medical literature.—*The Med. Bulletin*, May, 1878.

BUMSTEAD (FREEMAN J.), M.D., LL.D.,

Professor of Venereal Diseases at the Col. of Phys. and Surg., New York, &c.

THE PATHOLOGY AND TREATMENT OF VENEREAL DISEASES.

Including the results of recent investigations upon the subject. Fourth edition, revised and largely rewritten with the co-operation of R. W. Taylor, M.D., of New York, Prof. of Dermatology in the Univ. of Vt. In one large and handsome octavo volume of 835 pages, with 138 illustrations. Cloth, $4 75; leather, $5 75 (*Just Ready.*)

This work, on its first appearance, immediately took the position of a standard authority on its subject wherever the language is spoken, and the success of an Italian translation shows that it is regarded with equal favor on the Continent of Europe. In repeated editions the author labored sedulously to render it more worthy of its reputation, and in the present revision no pains have been spared to perfect it as far as possible. Several years having elapsed since the publication of the third edition, much material has been accumulated during the interval by the industry of syphilologists, and new views have been enunciated. All this so far as confirmed by observation and experience, has been incorporated; many portions of the volume been rewritten, the series of illustrations has been enlarged and improved, and the whole may be regarded rather as a new work than as a new edition. It is confidently presented as fully on a level with the most advanced condition of syphilology, and as a work to which the practitioner may refer with the certainty of finding clearly and succinctly set forth whatever falls within the scope of such a treatise.

However valuable the previous editions have been, the present is, to our thinking, decidedly of more worth. An air of completeness—of having had garnered into its pages all the best fruit of the world's experience and research upon the subject of which it treats—has been given to the book, without in any way detracting from the peculiarly practical value of previous editions. None the less clinical, the treatise seems much more cosmopolitan. The possession of old editions will be no excuse to the progressive physician for not purchasing this edition, and we predict for it a very speedy sale. We congratulate Dr. Bumstead on the wisdom which led to the selection of Dr. Taylor as colleague, and we sincerely congratulate the two coworkers upon the results of their labor.—*Philadelphia Medical Times*, Dec. 6, 1879.

As it now stands, this is the only complete modern work devoted exclusively to the discussion of venereal diseases. It was needed, and will be cordially welcomed by all who desire to keep abreast with the times in their knowledge of these subjects It is one of the few really good books needed by every practitioner of medicine or surgery, whether he be a general practitioner or specialist.—*Detroit Lancet*, December, 1879.

Dr. Bumstead's successful labors entitle him now to rank pre-eminently as *the* authority in this country on venereal diseases. But not only does this fact make his present treatise of interest to practitioners; the book is fully abreast with present literature on the subject of which it treats, is extremely practical in descriptions of the several venereal diseases and modes of treatment, and hence should be in every doctor's library.—*Va. Med. Monthly*, December, 1879.

CULLERIER (A.), and *BUMSTEAD (FREEMAN J.).*

Surgeon to the Hôpital du Midi.

Professor of Venereal Diseases in the College of Physicians and Surgeons, N. Y.

AN ATLAS OF VENEREAL DISEASES.

Translated and Edited by FREEMAN J. BUMSTEAD. In one large imperial 4to. volume of 328 pages, double-columns, with 26 plates, containing about 150 figures, beautifully colored, many of them the size of life; strongly bound in cloth, $17 00; also, in five parts, stout wrappers, at $3 per part.

Anticipating a very large sale for this work, it is offered at the very low price of THREE DOLLARS a Part, thus placing it within the reach of all who are interested in this department of practice. Gentlemen desiring early impressions of the plates would do well to order it without delay. A specimen of the plates and text sent free by mail, on receipt of 25 cents.

LEE'S LECTURES ON SYPHILIS AND SOME FORMS OF LOCAL DISEASE AFFECTING PRINCIPALLY THE ORGANS OF GENERATION. In one handsome octavo volume; cloth, $2 25.

HILL ON SYPHILIS AND LOCAL CONTAGIOUS DISORDERS. In one handsome octavo volume; cloth, $3 25.

SMITH'S PRACTICAL TREATISE ON THE WASTING DISEASES OF INFANCY AND CHILDHOOD. Second American, from the second revised and enlarged English edition. In one handsome octavo volume, cloth, $2 50.

MITH (J. LEWIS), M.D.,

Clinical Professor of Diseases of Children in the Bellevue Hospital Med. College, N Y.

A COMPLETE PRACTICAL TREATISE ON THE DISEASES OF CHILDREN. Fourth Edition, revised and enlarged. In one handsome octavo volume of about 750 pages, with illustrations. Cloth, $4 50; leather, $5 50. (*Now Ready.*)

he very marked favor with which this work has been received wherever the English lan-
e is spoken, has stimulated the author, in the preparation of the Fourth Edition, to spare
ins in the endeavor to render it worthy in every respect of a continuance of professional
dence. Many portions of the volume have been rewritten, and much new matter intro-
d, but by an earnest effort at condensation, the size of the work has not been materially
eased.

the period which has elapsed since the third
ion of the work, so extensive have been the ad-
es that whole chapters required to be rewritten,
hardly a page could pass without some material
tion or addition. This labor has occupied the
r closely, and he has performed it conscien-
ly, so that the book may be considered a faith-
portraiture of an exceptionally wide clinical
ience in infantile diseases, corrected by a care-
tudy of the recent literature of the subject.—
and Surg. Reporter*, April 5, 1879.

s scarcely necessary for us to say the work be-
is a standard work upon diseases of children,
at no work has a higher standing than it upon
affections. In consequence of its thorough re-
, the work has been made of more value than
and may be regarded as fully abreast of the
. We cordially commend it to students and
ians. There is no better work in the language
ases of children.—*Cincinnati Med. News*,
, 1879.

author has evidently determined that it shall
e ground in the esteem of the profession for
of the latest knowledge on that important
ment of medicine. He has accordingly in-
ated in the present edition the useful and
al results of the latest study and experience,
American and foreign, especially those bearing
herapeutics. Altogether the book has been
ly improved, while it has not been greatly
sed in size.—*New York Medical Journal*,
, 1879.

This excellent work is so well known that an extended notice at this time would be superfluous. The author has taken advantage of the demand for another new edition to revise in a most careful manner the entire book; and the numerous corrections and additions evince a determination on his part to keep fully abreast with the rapid progress that is being made in the knowledge and treatment of children's diseases. By the adoption of a somewhat closer type, an increase in size of only thirty pages has been necessitated by the new subject matter introduced.—*Boston Med. and Surg. Jour.*, May 29, 1879.

Probably no other work ever published in this country upon a medical subject has reached such a heighth of popularity as has this well-known treatise. As a text and reference-book it is pre-eminently the authority upon diseases of children. It stands deservedly higher in the estimation of the profession than any other work upon the same subject.—*Nashville Journ. of Med. and Surg.*, May, 1879.

The author of this work has acquired an immense experience as physician to three of the large charities of New York in which children are treated. These asylums afford unsurpassed opportunities for observing the effects of different plans of treatment, and the results as embodied in this volume may be accepted with faith, and should be in the possession of all practitioners *now*, in view of the approaching season when the diseases of children always increase. —*Nat. Med. Review*, April, 1879.

A PRACTICAL TREATISE ON THE DISEASES OF WOMEN. F

edition, enlarged and thoroughly revised. In one large and handsome octavo vol
800 pages, with 191 illustrations. Cloth, $5 00; leather, $6 00. (*Just Issued.*)

The author has taken advantage of the opportunity afforded by the call for another e
this work to render it worthy a continuance of the very remarkable favor with which it h
received. Every portion has been subjected to a conscientious revision, and no labor h
spared to make it a complete treatise on the most advanced condition of its important s

A work which has reached a fourth edition, and that, too, in the short space of five years, has achieved a reputation which places it almost beyond the reach of criticism, and the favorable opinions which we have already expressed of the former editions seem to require that we should do little more than announce this new issue. We cannot refrain from saying that, as a practical work, this is second to none in the English, or, indeed, in any other language. The arrangement of the contents, the admirably clear manner in which the subject of the differential diagnosis of several of the diseases is handled, leave nothing to be desired by the practitioner who wants a thoroughly clinical work, one to which he can refer in difficult cases of doubtful diagnosis with the certainty of gaining light and instruction. Dr. Thomas is a man with a very clear head and decided views, and there seems to be nothing which he so much dislikes as hazy notions of diagnosis and blind routine and unreasonable therapeutics. The student who will thoroughly study this book and test its principles by clinical observation, will certainly not be guilty of these faults.—*London Lancet*, Feb. 13, 1875.

Reluctantly we are obliged to close this unsatisfactory notice of so excellent a work, and in conclusion would remark that, as a teacher of gynæcology, both didactic and clinical, Prof. Thomas has certainly taken the lead far ahead of his *confrères*, and as an author he certainly has met with unusual and merited success.—*Am. Journ. of Obstetrics*, Nov. 1874.

This volume of Prof. Thomas in its revised form is classical without being pedantic, full in th
of anatomy and pathology, without pe
translation of pages of German literature, d
distinctly the details and difficulties of eac
tion, without wearying and useless minuti
in all respects a work worthy of confidence,
ing the high regard in which its distingui
thor is held by the profession.—*Am. Sup*
Obstet. Journ., Oct. 1874.

Professor Thomas fairly took the Professi
United States by storm when his book first
appearance early in 1868. Its reception wa
enthusiastic, notwithstanding a few adve
cisms from our transatlantic brethren, the
edition was rapidly exhausted, and in six
second one was issued, and in two years th
was announced and published, and we are
mised the fourth. The popularity of this w
not ephemeral, and its success was unprece
the annals of American medical literature.
is a long period in medical scientific rese
Thomas's work on "Diseases of Women" is
leading native production of the United Sta
order, the matter, the absence of theoretical
tiveness, the fairness of statement, and the
of diction, preserved throughout the entire
the book, indicate that Professor Thoma
overestimate his powers when he conceived
and executed the work of producing a new
upon diseases of women.—PROF. PALLEN,
ville Med. Journal, Sept. 1874.

BARNES (*ROBERT*), *M.D.*, *F.R.C.P.*,

Obstetric Physician to St. Thomas's Hospital, &c.

A CLINICAL EXPOSITION OF THE MEDICAL AND SU

CAL DISEASES OF WOMEN. Second American, from the Second Enlarged and
English Edition. In one handsome octavo volume, of 784 pages, with 181 illust
Cloth, $4 50; leather, $5 50. (*Just Ready.*)

The call for a new edition of Dr. Barnes's work on the Diseases of Females has enc
the author to make it even more worthy of the favor of the profession than before. By a
rangement and careful pruning space has been found for a new chapter on the Gynæco
Relations of the Bladder and Bowel Disorders, without increasing the size of the book,
many new illustrations have been introduced where experience has shown them to be nee
is therefore hoped that the volume will be found to reflect thoroughly and accurately the
condition of gynæcological science.

Dr Barnes stands at the head of his profession in the old country, and it requires but scant scrutiny of his book to show that it has been sketched by a master. It is plain, practical common sense; shows very deep research without being pedantic; is eminently calculated to inspire enthusiasm without inculcating rashness; points out the dangers to be avoided as well as the success to be achieved in the various operations connected with this branch of medicine; and will do much to smooth the rugged path of the young gynæcologist and relieve the perplexity of the man of mature years.—*Canadian Journ. of Med. Science*, Nov. 1878.

We pity the doctor who, having any considerable practice in diseases of women, has no copy of "Barnes" for daily consultation and instruction. It is at once a book of great learning, research, and individual experience, and at the same time eminently practical. That it has been appreciated by the profession, both in Great Britain and in this country, is shown by the second edition following so soon upon the first.—*Am. Practitioner*, Nov. 1878.

Dr. Barnes's work is one of a practical character, largely illustrated from cases in his own experience, but by no means confined to such, as will be learned from the fact that he quotes from no less than 628 medical authors in numerous countries. Coming from such an author, it is not necessary to say that the work is a valuable one, and should be
consulted by the profession.—*Am. Supp. O*
Journ. Gt. Britain and Ireland, Oct. 1878.

No other gynæcological work holds a hig
tion, having become an authority every
diseases of women. The work has been
fully abreast of present knowledge. Every
tioner of medicine should have it upon the
of his library, and the student will find it a
text-book.—*Cincinnati Med. News*, Oct. 187

This second revised edition, of course, dese
the commendation given to its predecessor, w
additional one that it appears to include all o
all the additions to our knowledge of its subj
have been made since the appearance of the fi
tion. The American references are, for an
work, especially full and appreciative, and
cordially recommend the volume to America
ers.—*Journ. of Nervous and Mental Disea*
1878.

This second edition of Dr. Barnes's great
comes to us containing many additions and im
ments which bring it up to date in every f
The excellences of the work are too well kn

MMET (THOMAS ADDIS). M.D.

Surgeon to the Woman's Hospital, New York, etc.

HE PRINCIPLES AND PRACTICE OF GYNÆCOLOGY, for the use of Students and Practitioners of Medicine. In one large and very handsome octavo volume of 856 pages, with 130 illustrations. Cloth, $5; leather, $6. (*Now Ready.*)

ay be said that he has had opportunities for ation and experience, for unfettered and un- ned experimentation, and for testing the of the original and dazzling operations first d and performed by his illustrious predeces- here referred to, and for devising new opera- and discovering pathological causes never suspected or described, which no man in the ion has ever before secured. We also think he readers of this work will agree with us, s careful perusal, that he has a rare capacity criminating analysis, and generally for phi- ical deduction and the equally important y of patient, honest, continued work. For the as a whole, we have only praise. It deserves ill receive the careful study of all who desire on a level with the progress of Gynæcology. dies a larger amount of carefully analyzed l experience in a unique field for observa- n any volume on Diseases of Women which been published. Its great merit consists in ing as it does from a thoroughly honest, t and able specialist, who became a spe- ly after an excellent training and experi- a general hospital physician and surgeon. k is not one to be hastily glanced over, but re the critical study of Gynæcologists. Not only its style, which is individual and somewhat peculiar, but the new facts which it brings out, its original suggestions, its numerous and important statistical tables, and, in some instances, its unexpected deductions, will compel attention, and will form the basis for a great deal of Gynæcological study and literature in the future. All who make themselves familiar with the contents of this volume, will feel assured that Dr Emmet has well earned and well deserved the reputation which he has already won, as one of the great Gynæcologists of the present age.—*The Am. Journ. of Obstetrics*, April, 1879.

We have examined this book with something more than ordinary care, and now lay it aside captivated by our impressions of it. From first to last, each page grows in interest, and one is struck with the practical tone of all that is said. It is indeed the gynæcological work for the practitioner. Its equal is not yet published, or at least we have not seen it. We cannot send this notice forward without reiterating that, in our estimation, Emmet's Principles and Practice of Gynæcology is undoubtedly the best book for the student, as well as the general practitioner, which is at present published.—*Va. Med. Monthly*, May, 1879.

A TREATISE ON THE SCIENCE AND PRACTICE OF MIDWIFER

Third American edition, revised by the author. Edited, with additions, by ROBERT HARRIS, M.D. In one handsome octavo volume of about 700 pages, with nearly illustrations. Cloth, $4; leather, $5. (*Just Ready*.)

EXTRACT FROM THE AUTHOR'S PREFACE.

The second American edition of my work on Midwifery being exhausted before the sponding English edition, I cannot better show my appreciation of the kind reception my has received in the United States than by acceding to the publisher's request that I myself undertake the issue of a third edition. As little more than a year has elapsed the second edition was issued, there are naturally not many changes to make, but I nevertheless, subjected the entire work to careful revision, and introduced into it a noti most of the more important recent additions to obstetric science. To the operation of ga elytrotomy—formerly described along with the Cæsarean section—I have now devoted a rate chapter. The editor of the Second American edition, Dr. Harris, enriched it with valuable notes, of which, it will be observed, I have freely availed myself.

A few notices of the previous edition are subjoined.

The best work on the subject ever published in the English language. It is written in a clear, pleasant style, without that verbosity which characterizes some modern and highly pretentious works. The author is quite up with the times, both in practice and theory. It is the best text-book we have for students, and sufficiently full of detail to supply all the wants of the practitioner. We would gladly see it in the hands of all who practise midwifery.—*Canadian Journ. of Med. Sci.*, Nov. 1878.

There has been a general unanimity of opini the profession as to the high character of Dr. fair's work, both as a manual for the student a book of reference for the practitioner; an revision and additions made to the second will not lower this favorable estimate of it. additions made by Dr. Harris are of such a acter as to make us wish they were more in ber and greater in extent.—*Am. Journ. of Sciences*, Jan. 1879.

BARNES (FANCOURT), M.D.,

Physician to the General Lying-in Hospital, London.

A MANUAL OF MIDWIFERY FOR MIDWIVES AND MEDIC STUDENTS.

With 50 illustrations. In one neat royal 12mo. volume of 200 cloth, $1 25. (*Now Ready.*)

The book is written in plain, and as far as possible in untechnical language. Any intelligent midwife or medical student can easily comprehend the directions. It will undoubtedly fill a want, and will be popular with those for whom it has been prepared. The examining questions at the back will be found very useful.—*Cincinnati Med. News*, Aug. 1879.

The style is clear, and the book will, dou be useful to the persons for whom it is inten *London Med. Times and Gazette*, Aug. 30, 1

The book is written with as little technical guage as possible. Any intelligent midwife or ical student can easily understand the direc It will undoubtedly be found very useful.—*Med. Recorder*, Sept. 1879.

THE OBSTETRICAL JOURNAL. (*Free of postage for* 1880.)

THE OBSTETRICAL JOURNAL of Great Britain and Irela

Including MIDWIFERY, and the DISEASES OF WOMEN AND INFANTS. A monthl 64 octavo pages, very handsomely printed. Subscription, Three Dollars per Single Numbers, 25 cents each.

With the January number will terminate Vol. VII. of the Obstetrical Journal. The No. of Vol. VIII. will be issued about Feb. 1st; the "AMERICAN SUPPLEMENT" of 16 per No. will be discontinued, and the periodical will thenceforth consist of 64 pages per num at the exceedingly low price of THREE DOLLARS per annum, free of postage. For this tri sum the subscriber will thus obtain more than 750 pages per annum, containing an extent variety of information which may be estimated from the fact that Vol. VI. of the "OBSTE CAL JOURNAL" contains in

and that it numbers among its contributors the distinguished names of LOMBE ATTHILL, J. AVELING, ROBERT BARNES, J. HENRY BENNET, NATHAN BOZEMAN, THOMAS CHAMBERS, FLE WOOD CHURCHILL, CHARLES CLAY, JOHN CLAY, J. MATTHEWS DUNCAN, ARTHUR FARRE, ROB GREENHALGH, W. M. GRAILY HEWITT, J. BRAXTON HICKS, WILLIAM LEISHMAN, ANGUS M DONALD, ALFRED MEADOWS, ALEX. SIMPSON, J. G. SWAYNE, LAWSON TAIT, EDWARD J. T E. H. TRENHOLME, T. SPENCER WELLS, ARTHUR WIGGLESWORTH, and many other dis guished practitioners. Under such auspices it has amply fulfilled its object of presenting the physician all that is new and interesting in the rapid development of obstetrical and gy cological science.

As a very large increase in the subscription list is anticipated under this reduction in pri gentlemen who propose to subscribe, and subscribers intending to renew their subscripti are recommended to lose no time in making their remittances, as the limited number pri may at any time be exhausted.

This is certainly a very excellent journal. It gives us the best obstetrical literature from across the water.—*Ind. Journ. of Med.*, Nov. 1874.

We cannot withhold the expression of the ad ration this elegant journal excites.—*Western La* March, 1875.

LEISHMAN (*WILLIAM*), *M.D.*,

Regius Professor of Midwifery in the University of Glasgow, &c.

A SYSTEM OF MIDWIFERY, INCLUDING THE DISEASES OF

PREGNANCY AND THE PUERPERAL STATE. Third American edition, revised by the Author, with additions by JOHN S. PARRY, M.D., Obstetrician to the Philadelphia Hospital, &c. In one large and very handsome octavo volume, of 733 pages, with over two hundred illustrations. Cloth, $4 50; leather, $5 50. (*Just Ready.*)

Few works on this subject have met with as great mand as this one appears to have. To judge the frequency with which its author's views are ted, and its statements referred to in obstetrical ature, one would judge that there are few phy- ns devoting much attention to obstetrics who without it. The author is evidently a man of experience and conservative views, and in no ch of medicine are these more valuable than in —*New Remedies*, Jan. 1880.

are glad to call the attention of our readers to new edition of Dr. Leishman's well-known k, which has already established itself in gene- favor both in this country and in America. In ing this third edition, we need only direct at- n to the differences between it and its prede- s. Although carefully revised throughout, et a few additions in various places, the net ement amounts only to a few pages.—*Glasgow l Journal*, Jan. 1880.

We gladly welcome the new edition of this excellent text-book of midwifery. The former editions have been most favorably received by the profession on both sides of the Atlantic. In the preparation of the present edition the author has made such alterations as the progress of obstetrical science seems to require, and we cannot but admire the ability with which the task has been performed. We consider it an admirable text-book for students during their attendance upon lectures, and have great pleasure in recommending it. As an exponent of the midwifery of the present day it has no superior in the English language.—*Canada Lancet*, Jan. 1880.

The book is greatly improved, and as such will be welcomed by those who are trying to keep posted in the rapid advances which are being made in the study of obstetrics.—*Boston Med. and Surg. Journ.*, Nov. 27, 1879.

RRY (*JOHN S.*), *M.D.*,

Obstetrician to the Philadelphia Hospital, Vice-Prest. of the Obstet. Society of Philadelphia.

EXTRA-UTERINE PREGNANCY: ITS CLINICAL HISTORY,

DIAGNOSIS, PROGNOSIS, AND TREATMENT. In one handsome octavo volume. Cloth, $2 50. (*Lately Issued.*)

DGE (*HUGH L.*), *M.D.*,

Emeritus Professor of Midwifery, &c., in the University of Pennsylvania, &c.

HE PRINCIPLES AND PRACTICE OF OBSTETRICS.

Illustrated with large lithographic plates containing one hundred and fifty-nine figures from original photographs, and with numerous wood-cuts. In one large and beautifully printed quarto volume of 550 double-columned pages, strongly bound in cloth, $14.

work of Dr. Hodge is something more than ple presentation of his particular views in the ment of Obstetrics; it is something more an ordinary treatise on midwifery; it is, in fact, lopædia of midwifery. He has aimed to em- in a single volume the whole science and art of rics. An elaborate text is combined with ac- and varied pictorial illustrations, so that no fact or principle is left unstated or unexplained. —*Am. Med. Times*, Sept. 3, 1864.

It is very large, profusely and elegantly illustrated, and is fitted to take its place near the works of great obstetricians. Of the American works on the subject it is decidedly the best.—*Edinb. Med. Jour.*, Dec. 1864.

Specimens of the plates and letter-press will be forwarded to any address, free by mail, ceipt of six cents in postage stamps.

MSON (*LEWIS A.*), *A.M.*, *M.D.*,

Surgeon to the Presbyterian Hospital.

MANUAL OF OPERATIVE SURGERY.

In one very handsome yal 12mo. volume of about 500 pages, with 332 illustrations; cloth, $2 50. (*Now Ready.*)

rk before us is a well printed, profusely d manual of over four hundred and seventy The novice, by a perusal of the work, will good idea of the general domain of operative y, while the practical surgeon has presented within a very concise and intelligible form st and most approved selections of operative res. The precision and conciseness with which fferent operations are described enable the to compress an immense amount of practical ation in a very small compass.—*N. Y. Medical*, Aug. 3, 1878.

volume is devoted entirely to operative sur- and is intended to familiarize the student with ails of operations and the different modes of performing them. The work is handsomely illustrated, and the descriptions are clear and well drawn. It is a clever and useful volume; every student should possess one. The preparation of this work does away with the necessity of pondering over larger works on surgery for descriptions of operations, as it presents in a nut-shell just what is wanted by the surgeon without an elaborate search to find it.—*Md. Med Journal*, Aug. 1878.

The author's conciseness and the repleteness of the work with valuable illustrations entitle it to be classed with the text-books for students of operative surgery, and as one of reference to the practitioner. —*Cincinnati Lancet and Clinic*, July 27, 1878.

'S OPERATIVE SURGERY. In 1 vol. 8vo. of 650 pages; with about 100 wood-cuts. $3 25.

'S LECTURES ON THE PRINCIPLES AND TICE OF SURGERY. In 1 vol. 8vo. cl'h, 750 p. $2.

'S INSTITUTES AND PRACTICE OF SUR- Y. Eighth edit'n, improved and altered. With y-four plates. In two handsome octavo vol- , about 1000 pp., leather, raised bands. $6 50.

PRINCIPLES AND PRACTICE OF SURGERY. y WILLIAM PIRRIE, F.R.S.E., Profes'r of Surgery the University of Aberdeen. Edited by JOHN NEILL, M.D., Professor of Surgery in the Penna. Medical College, Surg'n to the Pennsylvania Hospital, &c. In one very handsome octavo vol. of 780 pages, with 316 illustrations, cloth, $3 75.

MILLER'S PRINCIPLES OF SURGERY. Fourth American, from the Third Edinburgh Edition. In one large 8vo. vol. of 700 pages, with 340 illustrations, cloth, $3 75.

MILLER'S PRACTICE OF SURGERY. Fourth American, from the last Edinburgh Edition. Revised by the American editor. In one large 8vo. vol. of nearly 700 pages, with 364 illustrations; cloth, $3 75.

GROSS (SAMUEL D.), M.D.,
Professor of Surgery in the Jefferson Medical College of Philadelphia.

SYSTEM OF SURGERY: Pathological, Diagnostic, Therap

and Operative. Illustrated by upwards of Fourteen Hundred Engravings. Fifth ed carefully revised, and improved. In two large and beautifully printed imperial octav umes of about 2300 pp., strongly bound in leather, with raised bands, $15. (*Just Is*

The continued favor, shown by the exhaustion of successive large editions of this great w proves that it has successfully supplied a want felt by American practitioners and students the present revision no pains have been spared by the author to bring it in every respect up to the day. To effect this a large part of the work has been rewritten, and the whol arged by nearly one-fourth, notwithstanding which the price has been kept at its former moderate rate. By the use of a close, though very legible type, an unusually large amo matter is condensed in its pages, the two volumes containing as much as four or five ord octavos. This, combined with the most careful mechanical execution, and its very durable ing renders, it one of the cheapest works accessible to the profession. Every subject pr belonging to the domain of surgery is treated in detail, so that the student who posses work may be said to have in it a surgical library.

We have now brought our task to a conclusion, and have seldom read a work with the practical value of which we have been more impressed. Every chapter is so concisely put together, that the busy practitioner, when in difficulty, can at once find the information he requires. His work, on the contrary, is cosmopolitan, the surgery of the world being fully represented in it. The work, in fact, is so historically unprejudiced, and so eminently practical, that it is almost a false compliment to say that we believe it to be destined to occupy a foremost place as a work of reference, while a system of surgery like the present system of surgery is the practice of surgeons. The printing and binding of the work is unexceptionable; indeed, it contrasts, in the latter respect, remarkably with English medical and surgical cloth-bound publications, which are generally so wretchedly stitched as to require re-binding before they are any time in use.—*Dub. Journ. of Med. Sci.*, March, 1874.

Dr. Gross's Surgery, a great work, has become still greater, both in size and merit, in its most recent form. The difference in actual number of pages is not more than 130, but the size of the page having been increased to what we believe is technically termed "elephant," there has been room for considerable additions, which, together with the alterations, are improvements.—*Lond. Lancet*, Nov. 16, 1872.

It combines, as perfectly as possible, the qualities of a text-book and work of reference. We think this last edition of Gross's "Surgery," will confirm his " *Primus inter Pares.*" It is learned, scholar-li thodical, precise, and exhaustive. We scarcely any living man could write so complete and fa treatise, or comprehend more solid, instructive in the given number of pages. The labor mu been immense, and the work gives evidence powers of mind, and the highest order of inte discipline and methodical disposition, and arra of acquired knowledge and personal experienc *Med. Journ.*, Feb. 1873.

As a whole, we regard the work as the repre "System of Surgery" in the English langu *Louis Medical and Surg. Journ.*, Oct. 1872.

The two magnificent volumes before us affor complete view of the surgical knowledge of Some years ago we had the pleasure of prese first edition of Gross's Surgery to the profe work of unrivalled excellence; and now we h result of years of experience, labor, and study, densed upon the great work before us. And to or practitioners desirous of enriching their lib a treasure of reference, we can simply comm purchase of these two volumes of immense re *Cincinnati Lancet and Observer*, Sept. 1872.

A complete system of surgery—not a mere of operations, but a scientific account of surgic and practice in all its departments.—*Brit. Med Chir. Rev.*, Jan. 1873.

BY THE SAME AUTHOR.

A PRACTICAL TREATISE ON THE DISEASES, INJUR

and Malformations of the Urinary Bladder, the Prostate Gland, and the Urethra. Edition, thoroughly Revised and Condensed, by SAMUEL W. GROSS, M.D., Surg the Philadelphia Hospital. In one handsome octavo volume of 574 pages, with 17 trations: cloth, $4 50. (*Just Issued.*)

For reference and general information, the physician or surgeon can find no work that meets their necessities more thoroughly than this, a revised edition of an excellent treatise, and no medical library should be without it. Replete with handsome illustrations and good ideas, it has the unusual advantage of being easily comprehended, by the reasonable and practical manner in which the various subjects are systematized and arranged. We heartily recommend it to the profession as a valuable addition to the important literature of diseases of the urinary organs.—*Atlanta Med. Jou* 1876.

It is with pleasure we now again take up t work in a decidedly new dress. Indeed, it mu garded as a new book in very many of its par chapters on "Diseases of the Bladder," " Body," and "Lithotomy," are splendid spec descriptive writing; while the chapter on "St is one of the most concise and clear that we ha read.—*New York Med. Journ.*, Nov. 1876.

BY THE SAME AUTHOR.

A PRACTICAL TREATISE ON FOREIGN BODIES IN T

AIR-PASSAGES. In 1 vol. 8vo., with illustrations, pp. 468, cloth, $2 75.

DRUITT (ROBERT), M.R.C.S., &c.

THE PRINCIPLES AND PRACTICE OF MODERN SURGE

A new and revised American, from the eighth enlarged and improved London edition. trated with four hundred and thirty-two wood engravings. In one very handsome o volume, of nearly 700 large and closely printed pages, cloth, $4 00; leather, $5 00.

All that the surgical student or practitioner could desire.—*Dublin Quarterly Journal.*

It is a most admirable book. We do not know when we have examined one with more pleasure.—*Boston Med. and Surg. Journal.*

In Mr. Druitt's book, though containing only some seven hundred pages, both the principles and the practice of surgery are treated, and so clearl perspicuously, as to elucidate every importa We have examined the book most thoroughl can say that this success is well merited. Hi moreover, possesses the inestimable advant having the subjects perfectly well arrange classified and of being written in a style at clear and succinct.—*Am. Journal of Med. Scie*

SHHURST (JOHN, Jr.), M.D.,

Prof. of Clinical Surgery, Univ. of Pa., Surgeon to the Episcopal Hospital, Philadelphia

HE PRINCIPLES AND PRACTICE OF SURGERY. Second

edition, enlarged and revised. In one very large and handsome octavo volume of over 1000 pages, with 542 illustrations. Cloth, $6; leather, $7. (*Just Ready.*)

estionsness and thoroughness are two very traits of character in the author of this Out of these traits largely has grown the f his mental fruit in the past, and the pre- r seems in no wise an exception to what has ore. The general arrangement of the vol- he same as in the first edition, but every part n carefully revi-ed, and much new matter —*Phila. Med. Times*, Feb. 1, 1879.

ave previously spoken of Dr. Ashhurst's terms of praise. We wish to reiterate those ere. and to add that no more satisfactory tation of modern surgery has yet fallen press. In point of judicial fairness, of condensation, of accuracy and conciseness ssion and thoroughly good English, Prof. has no superior among the surgical writers ea.—*Am. Practitioner*, Jan. 1879.

empt to embrace in a volume of 1000 pages e field of surgery, general and special, a hopeless task unless through the most ndustry in collating and arranging, and judgment in condensing and excluding. ilities have been abundantly employed by er, and he has given us a most excellent brought up by the revision for the second the latest date. Of course this book is not for specialists, but as a course of general knowledge and for general practitioners, ext-book for students it is not surpassed t has yet appeared, whether of home or thorship.—*N. Carolina Med. Journal*,

Ashhurst's Surgery is too well known in this country to require special commendation from us. This, its second edition, enlarged and thoroughly revised, brings it nearer our idea of a model text-book than any recently published treatise. Though numerous additions have been made, the size of the work is not materially increased. The main trouble of text books of modern times is that they are too cumbersome. The student needs a book which will furnish him the most information in the shortest time. In every respect this work of Ashhurst is the model text-book - full, comprehensive and compact.—*Nashville Jour. of Med. and Surg.*, Jan. '79.

The favorable reception of the first edition is a guarantee of the popularity of this edition, which is fresh from the editor's hands with many enlargements and improvements. The author of this work is deservedly popular as an editor and writer, and his contributions to the literature of surgery have gained for him wide reputation. The volume now offered the profession will add new laurels to those already won by previous contributions. We can only add that the work is well arranged, filled with practical matter, and contains in brief and clear language all that is necessary to be learned by the student of surgery whilst in attendance upon lectures, or the general practitioner in his daily routine practice.—*Md. Med Journal*, Jan 1879.

The fact that this work has reached a second edition so very soon after the publication of the first one, speaks more highly of its merits than anything we might say in the way of commendation. It seems to have immediately gained the favor of students and physicians.—*Cincin. Med. News*, Jan. '79.

ANT (THOMAS), F.R.C.S.,

Surgeon to Guy's Hospital.

E PRACTICE OF SURGERY. Second American, from the Sec-

d and Revised English Edition. With Six Hundred and Seventy-two Engravings on ood. In one large and very handsome imperial octavo volume of over 1000 large and sely printed pages. Cloth, $6; leather, $7. (*Just Ready.*)

ork has enjoyed the advantage of two thorough revisions at the hand of the author since rance of the first American edition, resulting in a very notable enlargement of size and ent of matter. In England this has led to the division of the work into two volumes, e here comprised in one, the size being increased to a large imperial octavo, printed on ed but clear type. The series of illustrations has undergone a like revision, and will correspondingly improved.

arked success of the work on both sides of the Atlantic shows that the author has suc- in the effort to give to student and practitioner a sound and trustworthy guide in the of Surgery; while the simultaneous appearance of the present edition in England and country affords to the American reader the benefit of the most recent advances made surgical science.

so many text-books of surgery, so many skilled and distinguished hands, that to ob r of a third edition in England is no light . Bryant merits this, by clearness of style, udgment in selecting the operations he re- , in his new editions he goes carefully over rounds, in light of later research. On these allied points, Mr. Bryant is a calm and un- observer, and his book throughout has the it of maintaining the true scientific, judicial mind.—*Med. and Surg. Reporter*, March 22,

rk before us is the American reprint of the on edition, and has the advantage over the being of more convenient size, and in being ed into one volume. The author has rewrit- reater part of the work, and has succeeded, ount of new matter added, in making it mark- nctive from previous editions. A few extra e been added, and also a few new illustrations d. The publishers have presented the work able style. As a concise and practical manual surgery it is perhaps without an equal, and less always be a favorite text-book with the and practitioner.—*N. Y. Med. Record*, March

Another edition of this manual having been called for, the author has availed himself of the opportunity to make no few alterations in the substance as well as in the arrangement of the work, and, with a view to its improvement, has recast the materials and revised the whole. We ourselves are of the opinion that there is no better work on surgery extant.—*Cincinnati Med. News*, March, 1879.

Bryant's Surgery has been favorably received from the first, and evidently grows in the esteem of the profession with each succeeding edition. In glancing over the volume before us we find proof in almost every chapter of the thorough revision which the work has undergone, many parts having been cut out and replaced by matter entirely fresh.—*N. Y. Med. Journ.*, April, 1879.

Welcome as the new edition is, and as much as it is entitled to commendation, yet its appearance at this time is, in a certain sense, a matter of regret, as it will be in competition with another work, lately issued from the same press. But, the difficult task of forming a judgment as to the relative merits of Bryant and Ashhurst we will not attempt, but predict that, considering the high excellence of both, many others will likewise be forced to hesitate long in making choice between them.—*Cincinnati Lancet and Clinic*, March 22, 1879.

ERICHSEN (JOHN E.),

Professor of Surgery in University College, London, etc.

THE SCIENCE AND ART OF SURGERY; being a Treatise on
gical Injuries, Diseases, and Operations. Carefully revised by the author from
Seventh and enlarged English Edition. Illustrated by eight hundred and sixty tw
gravings on wood. In two large and beautiful octavo volumes of nearly 2000
cloth, $8 50; leather, $10 50. (*Now Ready.*)

In revising this standard work the author has spared no pains to render it worthy of a co
ance of the very marked favor which it has so long enjoyed, by bringing it thoroughly
level with the advance in the science and art of surgery made since the appearance
last edition. To accomplish this has required the addition of about two hundred pages of
while the illustrations have undergone a marked improvement. A hundred and fifty addi
wood-cuts have been inserted, while about fifty other new ones have been substituted for
which were not deemed satisfactory. In its enlarged and improved form it is therefore
sented with the confident anticipation that it will maintain its position in the front
text-books for the student, and of works of reference for the practitioner, while its exce
moderate price places it within the reach of all.

The seventh edition is before the world as the last word of surgical science. There may be monographs which excel it upon certain points, but as a conspectus upon surgical principles and practice it is unrivalled. It will well reward practitioners to read it, for it has been a peculiar province of Mr. Erichsen to demonstrate the absolute interdependence of medical and surgical science We need scarcely add, in conclusion, that we heartily commend the work to students that they may be grounded in a sound faith, and to practitioners as an invaluable guide at the bedside.—*Am. Practitioner*, April, 1878.

It is no idle compliment to say that this is the best edition Mr. Erichsen has ever produced of his well-known book. Besides inheriting the virtues of its predecessors, it possesses excellences quite its own. Having stated that Mr. Erichsen has incorporated into this edition every recent improvement in the science and art of surgery, it would be a supererogation to give a detailed criticism. In short, we unhesitatingly aver that we know of no other single work where the student and practitioner can gain at once so clear an insight into the principles of surgery, and so complete a knowledge of the exigencies of surgical practice.—*London Lancet*, Feb. 14, 1878

For the past twenty years Erichsen's Surgery has maintained its place as the leading text-book, not only in this country, but in Great Britain. That it is able to hold its ground, is abundantly proven by the thoroughness with which the present edition has been revised, and by the large amount of valuable material that has been added. Aside from this, one hundred and fifty new illustrations have been inserted, including quite a number of microscopical appearances of pathological processes. So marked is this change for the better, that the work almost appears as an entirely new one.—*Med. Record*, Feb. 23, 1878.

Of the many treatises on Surgery which it
our task to study, or our pleasure to read, there
which in all points has satisfied us so well as the
treatise of Erichsen. His polished, clear style,
dom from prejudice and hobbies, his unsurpa
of his subject, and vast clinical experience. qual
admirably to write a model text-book. When
at the least cost of time, to learn the most of a
surgery, we turn, by preference, to his work.
pleasure, therefore, to see that the appreciatio
general, and has led to the appearance of ano
tion.—*Med. and Surg. Reporter*, Feb. 2, 1878.

Notwithstanding the increase in size, we ob
much old matter has been omitted. The en
has been thoroughly written up, and not merely
ed by a few extra chapters. A great improve
been made in the illustrations. One hundred
new ones have been added, and many of the
have been redrawn. The author highly appre
favor with which his work has been received by
can surgeons, and has endeavored to render
edition more than ever worthy of their appro
he has succeeded admirably, must, we think,
general opinion. We heartily recommend the
both student and practitioner.—*N. Y. Med.*
Feb. 1878.

Erichsen has stood so prominently for
years as a writer on Surgery, that his repu
world wide, and his name is as familiar to
ical student as to the accomplished and exp
surgeon. The work is not a reprint of for
tions, but has in many places been entirely
ten. Recent improvements in surgery have
caped his notice, various new operations ha
thoroughly analyzed, and their merits the
discussed. One hundred and fifty new w
add to the value of this work.—*N. O. Med. a*
Journal, March, 1878.

HOLMES (TIMOTHY), M.D.,

Surgeon to St. George's Hospital, London.

SURGERY, ITS PRINCIPLES AND PRACTICE. In one
some octavo volume of nearly 1000 pages, with 411 illustrations. Cloth, $6; leath
(*Just Issued.*)

This is a work which has been looked for on both sides of the Atlantic with much interest. Mr. Holmes is a surgeon of large and varied experience, and one of the best known, and perhaps the most brilliant writer upon surgical subjects in England. It is a book for students—and an admirable one—and for the busy general practitioner. It will give a student all the knowledge needed to pass a rigid examination. The book fairly justifies the high expectations that were formed of it. Its style is clear and forcible, even brilliant at times, and the conciseness needed to bring it within its proper limits has not impaired its force and distinctness.—*N. Y. Med. Record*,
14, 1876.

It will be found a most excellent epitome
gery by the general practitioner who has
time to give attention to more minute and e
works and to the medical student. In fact, w
of no one we can more cordially recommend.
author has succeeded well in giving a pla
practical account of each surgical injury a
ease, and of the treatment which is mo
monly advisable. It will no doubt become a
lar work in the profession, and especially as
book.—*Cincinnati Med. News*, April, 1876.

ASHTON ON THE DISEASES, INJURIES, AND MALFORMATIONS OF THE RECTUM AND ANUS; with remarks on Habitual Constipation. Second American, from the fourth and enlarged London Edition. With illustrations. In one 8vo. vol. of 281 pages, cloth, $3 25.

SARGENT ON BANDAGING AND OTHER O
TIONS OF MINOR SURGERY. New editio
an additional chapter on Military Surgery.
12mo. vol. of 383 pages with 181 wood-cuts.
$1 75.

AMILTON (FRANK H.), M.D.,

Professor of Fractures and Dislocations, &c., in Bellevue Hosp. Med. College, New York.

PRACTICAL TREATISE ON FRACTURES AND DISLOCATIONS. Fifth edition, revised and improved. In one large and handsome octavo volume of nearly 800 pages, with 344 illustrations. Cloth, $5 75; leather, $6 75. (*Lately Issued.*)

is work is well known, abroad as well as at home, as the highest authority on its important —an authority recognized in the courts as well as in the schools and in practice—and manifested, not only by the demand for a fifth edition, but by arrangements now in pro- for the speedy appearance of a translation in Germany. The repeated revisions which the r has thus had the opportunity of making have enabled him to give the most careful consid- to every portion of the volume, and he has sedulously endeavored in the present issue, fect the work by the aid of his own enlarged experience, and to incorporate in it whatever lue has been added in this department since the issue of the fourth edition. It will there- e found considerably improved in matter, while the most careful attention has been paid typographical execution, and the volume is presented to the profession in the confident hat it will more than maintain its very distinguished reputation.

is no better work on the subject in existence at of Dr. Hamilton. It should be in the posses- every general practitioner and surgeon.—*The rn. of Obstetrics*, Feb. 1876.

alue of a work like this to the practical physi- surgeon can hardly be over-estimated, and the y of having such a book revised to the latest t merely on account of the practical importance of its teachings, but also by reason of the medico-legal bearings of the cases of which it treats, and which have recently been the subject of useful papers by Dr. Hamilton and others, is sufficiently obvious to every one. The present volume seems to amply fill all the requisites. We can safely recommend it as the best of its kind in the English language, and not excelled in any other. *Journ. of Nervous and Mental Disease*, Jan. 1876.

OWNE (EDGAR A.),

Surgeon to the Liverpool Eye and Ear Infirmary, and to the Dispensary for Skin Diseases.

LAWSON'S INJURIES TO THE EYE, ORBIT, AND EYELIDS: their Immediate and Remote Effects. With about one hundred illustrations. In one very handsome octavo volume, cloth, $3 50.

BURNETT (CHARLES H.), M.A., M.D.,

Aural Surg. to the Presb. Hosp., Surgeon-in-charge of the Infir. for Dis. of the Ear, Phila.

THE EAR, ITS ANATOMY, PHYSIOLOGY, AND DISEASES

A Practical Treatise for the Use of Medical Students and Practitioners. In one handsome octavo volume of 615 pages, with eighty-seven illustrations: cloth, $4 50; leather $5 50. (*Now Ready.*)

Recent progress in the investigation of the structures of the ear, and advances made in th modes of treating its diseases, would seem to render desirable a new work in which all the resources of the most advanced science should be placed at the disposal of the practitioner. Thi it has been the aim of Dr. Burnett to accomplish, and the advantages which he has enjoyed i the special study of the subject are a guarantee that the result of his labors will prove of servic to the profession at large, as well as to the specialist in this department.

Foremost among the numerous recent contributions to aural literature will be ranked this work of Dr. Burnett. It is impossible to do justice to this volume of over 600 pages in a necessarily brief notice. It must suffice to add that the book is profusely and accurately illustrated, the references are conscientiously acknowledged, while the result has been to produce a treatise which will henceforth rank with the classic writings of Wilde and Von Tröltsch.—*The Lond. Practitioner*, May, 1879.

On account of the great advances which have been made of late years in otology, and of the increased interest manifested in it, the medical profession will welcome this new work, which presents clearly and concisely its present aspect, whilst clearly indicating the direction in which further researches can be most profitably carried on. Dr. Burnett from his own matured experience, and availing himself of the observations and discoveries of others, has produced a work, which as a text-book, stands *facile princeps* in our language. We had marked several passages as well worthy of quotation and the attention of the general practitioner, but their number and the space at our command forbid. Perhaps it is better, as the book ought to be in the hands of every medical student, and its study will well repay th busy practitioner in the pleasure he will derive fro the agreeable style in which many otherwise dr and mostly unknown subjects are treated. To th specialist the work is of the highest value, and h sense of gratitude to Dr. Burnett will we hope, b proportionate to the amount of benefit he can obtai from the careful study of the book, and a consta reference to its trustworthy pages.—*Edinbu g Med. Jour.*, Aug. 1878.

The book is designed especially for the use of students and general practitioners, and places at thei disposal much valuable material. Such a book a the present one, we think, has long been needed, an we may congratulate the author on his success i filling the gap. Both student and practitioner ca study the work with a great deal of benefit. It i profusely and beautifully illustrated.—*N. Y. Ho pital Gazette*, Oct 15, 1877.

Dr. Burnett is to be commended for having writte the best book on the subject in the English languag and especially for the care and attention he ba given to the scientific side of the subject.—*N. Med. Journ.*, Dec. 1877.

TAYLOR (ALFRED S.), M.D.,

Lecturer on Med. Jurisp. and Chemistry in Guy's Hospital.

POISONS IN RELATION TO MEDICAL JURISPRUDENCE AN MEDICINE.

Third American, from the Third and Revised English Edition. In on large octavo volume of 850 pages; cloth, $5 50; leather, $6 50. (*Just Issued.*)

The present is based upon the two previous editions; "but the complete revision rendered necessary by time has converted it into a new work." This statement from the preface contains all that it is desired to know in reference to the new edition. The works of this author are already in the library of every physician who is liable to be called upon for medico-legal testimony (and what one is not?), so that all that is required to be known about the present book is that the author has kept it abreast with the times. What makes it now, as always, especially valuable to the practitioner is its conciseness and practical character, only those poisonous substances being described which give rise to legal investigations.—*The Clinic*, Nov. 6, 1875.

Dr. Taylor has brought to bear on the compilatio of this volume, stores of learning, experience, an practical acquaintance with his subject, probably fa beyond what any other living authority on toxicology could have amassed or utilized. He has full sustained his reputation by the consummate ski and legal acumen he has displayed in the arrangement of the subject-matter, and the result is a wor on Poisons which will be indispensable to every st dent or practitioner in law and medicine.—*The Du lin Journ. of Med. Sci.*, Oct. 1875.

BY THE SAME AUTHOR.

MEDICAL JURISPRUDENCE.

Seventh American Edition. Edite by JOHN J. REESE, M.D., Prof. of Med. Jurisp. in the Univ. of Penn. In one larg octavo volume of nearly 900 pages. Cloth, $5 00; leather, $6 00. (*Lately Issued.*)

To the members of the legal and medical profession, it is unnecessary to say anything commendatory of Taylor's Medical Jurisprudence. We might as well undertake to speak of the merit of Chitty's Pleadings.—*Chicago Legal News*, Oct. 16, 1873.

It is beyond question the most attractive as well as most reliable manual of medical jurisprudence published in the English language.—*Am. Journal of Syphilography*, Oct. 1873.

It is altogether superfluous for us to offer anything in behalf of a work on medical jurisprudence by an author who is almost universally esteemed to be the best authority on this specialty in our language. O this point, however, we will say that we consider D Taylor to be the safest medico-legal authority to follow, in general, with which we are acquainted in an language.—*Va. Clin. Record*, Nov. 1873.

This last edition of the Manual is probably the be of all, as it contains more material and is worked u to the latest views of the author as expressed in th last edition of the Principles. Dr. Reese, the edit of the Manual, has done everything to make hi work acceptable to his medical countrymen.—*N. Med. Record*, Jan. 15, 1874.

BY THE SAME AUTHOR.

THE PRINCIPLES AND PRACTICE OF MEDICAL JURISPRUDENCE.

Second Edition, Revised, with numerous Illustrations. In two large octav volumes, cloth, $10 00; leather, $12 00

This great work is now recognised in England as the fullest and most authoritative treatise on every department of its important subject. In laying it, in its improved form, before the American profession, the publisher trusts that it will assume the same position in this country.

OBERTS (WILLIAM), M.D.,

Lecturer on Medicine in the Manchester School of Medicine, etc.

A PRACTICAL TREATISE ON URINARY AND RENAL DISEASES, including Urinary Deposits. Illustrated by numerous cases and engravings. Third American, from the Third Revised and Enlarged London Edition. In one large and handsome octavo volume of over 600 pages. Cloth, $4. (*Just Ready.*)

HOMPSON (SIR HENRY),

Surgeon and Professor of Clinical Surgery to University College Hospital.

LECTURES ON DISEASES OF THE URINARY ORGANS. With illustrations on wood. Second American from the Third English Edition. In one neat octavo volume. Cloth, $2 25. (*Just Issued.*)

THE SAME AUTHOR.

N THE PATHOLOGY AND TREATMENT OF STRICTURE OF THE URETHRA AND URINARY FISTULÆ. With plates and wood-cuts. From the third and revised English edition. In one very handsome octavo volume, cloth, $3 50. (*Lately Published.*)

KE (DANIEL HACK), M.D.,

Joint author of "The Manual of Psychological Medicine," &c.

LLUSTRATIONS OF THE INFLUENCE OF THE MIND UPON THE BODY IN HEALTH AND DISEASE. Designed to illustrate the Action of the Imagination. In one handsome octavo volume of 416 pages, cloth, $3 25. (*Lately Issued.*)

LANDFORD (G. FIELDING), M.D., F.R.C.P.,

Lecturer on Psychological Medicine at the School of St. George's Hospital, &c.

SANITY AND ITS TREATMENT: Lectures on the Treatment, Medical and Legal, of Insane Patients. With a Summary of the Laws in force in the United States on the Confinement of the Insane. By Isaac Ray, M. D. In one very handsome octavo volume of 471 pages; cloth, $3 25.

tisfies a want which must have been sorely the busy general practitioners of this country. s the form of a manual of clinical description various forms of insanity, with a description mode of examining persons suspected of in-. We call particular attention to this feature book, as giving it a unique value to the gene- ctitioner. If we pass from theoretical conside- to descriptions of the varieties of insanity as actually seen in practice and the appropriate treatment for them, we find in Dr. Blandford's work a considerable advance over previous writings on the subject. His pictures of the various forms of mental disease are so clear and good that no reader can fail to be struck with their superiority to those given in ordinary manuals in the English language or (so far as our own reading extends) in any other.—*London Practitioner*, Feb. 1871.

A (HENRY C.).

UPERSTITION AND FORCE: ESSAYS ON THE WAGER OF LAW, THE WAGER OF BATTLE, THE ORDEAL, AND TORTURE. Third Revised and Enlarged Edition. In one handsome royal 12mo. volume of 552 pages. Cloth, $2 50. (*Just Ready.*)

ppearance of a new edition of Mr. Henry C. "Superstition and Force" is a sign that our scholarship is not without honor in its na- ntry. Mr. Lea has met every fresh demand work with a careful revision of it, and the edition is not only fuller and, if possible, curate than either of the preceding, but, thorough elaboration, is more like a har- concert and less like a batch of studies.— n, Aug. 1, 1878.

will be tempted to say that this, like the and Fall," is one of the uncriticizable books are innumerable, its deductions simple and le, and its *chevaux-de-frise* of references and dense enough to make the keenest, , and best equipped assailant think twice advancing. Nor is there anything contro- lis it to provoke assault. The author is no polemic. Though he obviously feels and thinks strongly, he succeeds in attaining impartiality. Whether looked on as a picture or a mirror, a work such as this has a lasting value.—*Lippincott's Magazine*, Oct. 1878.

Mr. Lea's curious historical monographs, of which one of the most important is here reproduced in an enlarged form, have given him an unique position among English and American scholars. He is distinguished for his recondite and affluent learning, his power of exhaustive historical analysis, the breadth and accuracy of his researches among the rarer sources of knowledge, the gravity and temperance of his statements, combined with singular earnestness of conviction, and his warm attachment to the cause of human freedom and intellectual progress.—*N. Y. Tribune*, Aug. 9, 1878.

THE SAME AUTHOR. (*Lately Published.*)

STUDIES IN CHURCH HISTORY—THE RISE OF THE TEMPORAL POWER—BENEFIT OF CLERGY—EXCOMMUNICATION. In one large royal 12mo. volume of 516 pp.; cloth, $2 75.

story was never told more calmly or with learning or wiser thought. We doubt, indeed, other study of this field can be compared with r clearness, accuracy, and power.—*Chicago* ner, Dec. 1870.

Lea's latest work, "Studies in Church History," stains the promise of the first. It deals with subjects—the Temporal Power, Benefit of y, and Excommunication, the record of which has a peculiar importance for the English student, and is a chapter on Ancient Law likely to be regarded as final. We can hardly pass from our mention of such works as these—with which that on "Sacerdotal Celibacy" should be included—without noting the literary phenomenon that the head of one of the first American houses is also the writer of some of its most original books.—*London Athenæum*, Jan. 7 1871.

LEISHMAN'S MIDWIFERY—New Edition—Just Ready.

STEM OF MIDWIFERY: Including the Diseases of Pregnancy and the Puerperal tate. By WILLIAM LEISHMAN, M.D., Regius Professor of Midwifery in the University of Glasgow, etc. Third American edition, revised by the author, with additions by JOHN . PARRY, M.D., Obstetrician to the Philadelphia Hospital. In one large and very andsome 8vo. volume of 733 pages, with over 200 illustrations; cloth, $4 50; leather, $5 50.

new edition has evidently been carefully re- by its author and will be welcomed by those trying to keep posted in the rapid advances are being made in the study of obstetrics.— Med. and Surg. Journ., Nov. 27, 1879.

s been well and carefully written. The views author are broad and liberal, and indicate a lanced judgment and matured mind. We ob- spirit of dogmatism, but the earnest teach- the thoughtful observer and lover of true . Take the volume as a whole and it has few —*Maryland Med. Journal*, Feb. 1880.

work is a thoroughly good one, and is well to the requirements of the practical obstet- It is something more than a compend de- for the medical student: it is a book to be by the practitioner, and it will seldom disappoint him. It is of convenient size, clearly written, and eminently practical. As such, we heartily commend it to our readers.—*St. Louis Clin. Record*, Jan. 1880.

We gladly welcome the new edition of this excellent text-book of midwifery. The former editions have been most favorably received by the profession on both sides of the Atlantic. In the preparation of the present edition the author has made such alterations as the progress of obstetrical science seems to require, and we cannot but admire the ability with which the task has been performed. We consider it an admirable text-book for students during their attendance upon lectures, and have great pleasure in recommending it. As an exponent of the midwifery of the present day it has no superior in the English language.—*Canada Lancet*, Jan. 1880.

BUMSTEAD ON VENEREAL DISEASES—Fourth Edition—Now Ready.

ATHOLOGY AND TREATMENT OF VENEREAL DISEASES: Including the results recent investigations upon the subject. By FREEMAN J. BUMSTEAD, M.D., LL.D., fessor of Venereal Diseases in the Coll. of Phys. and Surg., New York, etc. Fourth edi- , revised and largely rewritten with the co-operation of R. W. TAYLOR, M.D., of New rk, Prof. of Dermatology in the Univ. of Vermont. In one large and handsome 8vo. ume of 835 pages, with 138 illustrations; cloth, $4 75; leather, $5 75.

that we have here practically a new book, the statement of the title-page as to the fact has been largely rewritten, is a sufficiently nouncement for the important changes in We take pleasure in repeating, that we this to be the best treatise on venereal dis- the English language, and we congratulate upon their brilliant additions to Amer- cal literature.—*Amer. Journ. Med. Sci.*, y, 1880.

Each of the three previous editions, practical handbooks as well as scientific monographs, has ranked *facile princeps* among literary productions in the English language upon these topics. The present edition is a marked advance upon the preceding ones. It has lost nothing by the addition of the advanced views, the active brain, and the industrious pen of the new co-editor.—*Boston Med. and Surg. Journ.*, January, 1880.

SMITH ON CHILDREN—New Edition—Just Issued.

PLETE PRACTICAL TREATISE ON THE DISEASES OF CHILDREN. By J. WIS SMITH, M.D., Clinical Professor of Diseases of Children in the Bellevue Hospital dical College, New York. Fourth edition, revised and enlarged. In one handsome tavo volume of over 750 pages, with illustrations; cloth, $4 50; leather, $5 50.

period which has elapsed since the third of the work, so extensive have been the ad- that whole chapters required to be rewritten, a page could pass without some material or addition. This labor has occupied the , and he has performed it conscientiously, so that the book may be considered a faithful portraiture of an exceptionally wide clinical experience in infantile diseases, corrected by a careful study of the recent literature of the subject.—*Med. and Surg. Reporter*, April 5, 1879.

BRISTOWE'S PRACTICE—Second Edition—Now Ready.

ATISE ON THE PRACTICE OF MEDICINE. By JOHN SYER BRISTOWE, M.D., R.C.P., Physician and Joint Lecturer on Medicine, St. Thomas's Hospital. Second edi- , revised by the author. Edited, with additions, by JAMES H. HUTCHINSON, M.D., ysician to the Pennsylvania Hospital. In one handsome octavo volume of nearly 1200 ges, with illustrations; cloth, $5; leather, $6.

we said of the first edition we can with in- emphasis repeat concerning this: "Every characterized by the utterances of a thought- . What has been said, has been well said, book is a fair reflex of all that is certainly on the subjects considered."—*Ohio Med. Re-* , Jan. 1880.

accuracy in the portraiture of disease, his care in stating subtle points of diagnosis, and the faithfully given pathology of abnormal processes have seldom been surpassed. He embraces many diseases not usually considered to belong to theory and practice, as skin diseases, syphilis, and insanity, but they will not be objected to by readers, as he has studied them conscientiously, and drawn from the life.—*Med. and Surg. Reporter*, Dec. 20, 1879.

PLAYFAIR'S MIDWIFERY—Third Edition—Now Ready.

ATISE ON THE SCIENCE AND PRACTICE OF MIDWIFERY. By W. S. PLAYFAIR, M.D., F.R.C.P., Professor of Obstetric Medicine in King's College, etc. etc. Third American edition, revised by the author. Edited, with additions, by ROBERT P. HARRIS, M.D. In one handsome octavo volume of 654 pages, with two plates, and 183 illustrations. Cloth, $4; leather, $5.

HENRY C. LEA'S SON & CO., Philadelphia.

NOTICE TO SUBSCRIBERS.

INCREASED INDUCEMENTS FOR 1880.

With a view of increasing the attractions of the "American Journal of the Medical Sciences," and of bringing within the reach of all members of the profession the immense amount of information now presented by it and its accessory periodicals, the "Medical News and Library" and the "Monthly Abstract," the two latter will hereafter be merged together, under the name of "The Medical News and Abstract," commencing January 1, 1880. The "News and Abstract" will consist of sixty-four pages per month, handsomely printed, in a neat cover, and will contain all the material heretofore presented in both periodicals, with the exception of the sixteen pages of the "Library Department." Its price will be Two Dollars and a Half per annum, invariably in advance, at which rate subscribers will receive nearly *eight hundred large octavo pages per annum*, free of postage.

Not only will this monthly thus be in itself one of the cheapest periodicals offered the profession, but it will be furnished in commutation, without charge, to advance-payi subscribers of the "American Journal of the Medical Sciences," the subscription which will remain, as heretofore, Five Dollars per annum. For this very moder sum, therefore, subscribers will receive two periodicals of the highest class, a Quarter and a Monthly, containing in all nearly two thousand pages per annum, stored with t choicest original and selected matter that can be furnished by the medical literature both hemispheres.

These terms may be recapitulated as follows:—

TERMS FOR 1880.

The American Journal of the Medical Sciences, published quarterly (1150 pages per annum), and
The Medical News and Abstract, published monthly (768 pages per annum),
} Five Doll per ann in advan

SEPARATE SUBSCRIPTIONS TO

The American Journal of the Medical Sciences, when not paid for in advance. } Five Doll
The Medical News and Abstract, invariably in advance, Two Dollars and a Half.

*** Advance-paying subscribers can obtain, at the close of the year, cloth covers, lettered, for binding the volumes of the Journal (two annually) and the News Abstract (one annually), free by mail, on remitting ten cents for each cover.

It is evident that only a very considerable increase to the existing subscription will justify the unexampled terms thus offered, by which the equivalent of three or large octavo volumes is furnished, handsomely printed in a form for preservation, for trifling sum of Five Dollars. Gentlemen, therefore, are respectfully requested to no time in remitting their subscriptions to avoid the risk of disappointment from exhaustion of the edition printed; and it is suggested that they may aid in renderi the enterprise permanent by kindly communicating to their friends the very great indu ments thus offered.

The safest mode of remittance is by bank check or draft, or postal money order to the order of the undersigned. Where these are not accessible, remittances for "Journal" and "News and Abstract" may be made at the risk of the publishers forwarding in registered letters. Address

New Medical Publications.

BRISTOWE'S PRACTICE—Second Edition—Now Ready.

A TREATISE ON THE PRACTICE OF MEDICINE. By **John Syer Bristowe**, M F.R C.P., Physician and Joint Lecturer on Medicine, St. Thomas's Hospital. Second tion, revised by the author. Edited, with additions, by **James H. Hutchinson**, M Physician to the Pennsylvania Hospital. In one handsome octavo volume of nearly pages, with illustrations; cloth, $5 50; leather, $6 50.

The second edition of this excellent work, like the first, has received the benefit of Dr. Hutchinson's annotations, by which the phases of disease which are peculiar to this country are indicated, and thus a treatise which was intended for British practitioners and students is made more practically useful on this side of the water. We see no reason to modify the high opinion previously expressed with regard to Dr. Bristowe's work, except by adding our appreciation of the careful labors of the author in following the latest growth of medical science. The chapter on diseases of the skin and of the nervous system, with a new one on insanity compiled from the best sources outside of the author's own long experience, and the valuable portion relating to general pathology, aid greatly in completing an exceptionally good book for purposes of reference and instruction.—*Boston Medical and Surgical Journal*, February, 1880.

The views of the author are expressed with precision and sufficient promptness to impress the dent with the weight of his authority; and the medical professor differ on any subject from doctrine, he will need to find strong argument carry his class to the opposite conclusion.— *Orleans Medical and Surgical Journal*, Febru 1880.

The reader will find every conceivable connected with the practice of medicine, ably sented in a style at once clear, interesting, and cise. The additions made by Dr. Hutchinson appropriate and practical, and greatly add to its fulness to American readers.—*Buffalo Medical Surgical Journal*, March, 1880.

We regard it as an excellent work for stu and for practitioners. It is clearly written author's style is attractive, and it is especial be commended for its excellent exposition of pathology and clinical phenomena of disease.- *Louis Clinical Record*, February, 1880.

DUNCAN ON WOMEN—Just Ready.

CLINICAL LECTURES ON THE DISEASES OF WOMEN. Delivered in St. Barthol Hospital. By **J. Matthews Duncan**, M.D., LL.D., F.R.S.E., etc. In one very neat o volume of 175 pages; cloth, $1 50.

They are in every way worthy of their author; indeed, we look upon them as among the most valuable of his contributions. They are all upon matters of great interest to the general practitioner. Some of them deal with subjects that are not, as a rule, adequately handled in the text-books; others of them, while bearing upon topics that are usually treated of at length in such works, yet bear such a stamp of individuality that, if widely read, as they certainly deserve to be, they cannot fail to exert a wholesome restraint upon the undue eagerness with which many young physicians seem bent upon following the wild teachings which so infest the gynæcology of the present day.—*N. Y. Med. Journ.*, March, 1880.

The author is a remarkably clear lecturer his discussion of symptoms and treatment and suggestive. It will be a work which wil fail to be read with benefit by practitioners as by students.—*Phila. Med. and Surg. Rep* Feb 7, 1880.

We have read this book with a great de pleasure. It is full of good things. The hi pathology and treatment scattered through the are sound, trustworthy, and of great valu healthy scepticism, a large experience, and judgment are everywhere manifest. Inst bristling with advice of doubtful value an sound character, the book is in every respect guide.—*The London Lancet*, Jan. 24, 1880.

FLINT'S CLINICAL MEDICINE—Just Ready.

CLINICAL MEDICINE: A Systematic Treatise on the Diagnosis and Treatment of Dis Designed for Students and Practitioners of Medicine. By **Austin Flint**, M.D., Profe of the Principles and Practice of Medicine and of Clinical Medicine in Bellevue Me College, N. Y. In one large and handsome octavo volume of 795 pages. Cloth, $4

We feel bound to say that the author has accomplished in a creditable manner the difficult task of producing not only a complete but a useful text-book of modern science. Its merits are many and great—its faults, for a work of such range and dimensions, few, and, with the exception of two or three points of questionable practice, criticized in our former and the present notice, comparatively trivial. We heartily congratulate the veteran author on the completion of his undertaking, and strongly recommend his text-book as not only the most recent but the most complete hitherto published on clinical medicine.—*Dublin Journ. of Med. Science*, Jan. 1880.

Nothing but the most unbounded praise is equal to the merits of the book. At once in the introductory chapter we recognize the master's hand. It is most admirably written.—*Phila. Med. Times*, Feb. 28, 1880.

There is every reason to believe that this book will be well received. The active practitioner is frequently in need of some work that will enable him to obtain information in the diagnosis and ment of cases with comparatively little labor. Flint has the faculty of expressing himself and at the same time so concisely as to enab searcher to traverse the entire ground of his and at the same time obtain all that is without plodding through an interminable *N. Y. Med. Jour.*, Nov. 1879.

The great object is to place before the read latest observations and experience in diagnosi treatment. Such a work is especially valu students. It is complete in its special desig yet so condensed, that he can by its aid ke with the lectures on practice without neg other branches. It will not escape the notice practitioner that such a work is most valua culling points in diagnosis and treatment in tervals between the daily rounds of visits, can in a few minutes refresh his memory, or the latest advance in the treatment of diseases demand his instant attention.—*Cincinnati and Clinic*, Oct. 25, 1879.

ROBERTS ON RENAL DISEASES—New Edition—Just Ready.

A PRACTICAL TREATISE ON URINARY AND RENAL DISEASES, INCLUDING NARY DEPOSITS. By **William Roberts**, M.D., Lecturer on Medicine in the Manc School of Medicine, etc. Illustrated by numerous cases and engravings. Third Ame from the third revised and enlarged English edition. In one handsome octavo v of over 600 pages. Cloth, $4.

CLINICAL LECTURE ON DISEASES OF WOMEN,

LIVERED AT THE COLLEGE OF PHYSICIANS AND SURGEONS, NEW YORK.

BY T. GAILLARD THOMAS, M.D.,

OF THE DISEASES OF WOMEN IN THE COLLEGE OF PHYSICIANS AND SURGEONS, NEW YORK.

[Reported by P. Brynberg Porter, M.D., and Revised by the Author.]

ASE I.—*Very Marked Anteflexion of the Uterus, giving rise to turnal Incontinence of Urine.*

ENTLEMEN : This patient, whose name is Mary R——, is twenty years a native of the United States, and single. Her case would not ordiy be considered of much consequence; but I regard it as a very imnt one for us, because it illustrates so perfectly the necessity of making sical examination whenever anything in the history points towards elvic viscera. The chief symptom, and there is apparently only one y consequence here, is a very curious one, and it would otherwise in a complete mystery; while, in the light of such an explanation, it es a perfectly simple matter. She states that she has had the trouble hich she is now complaining for seven years, or ever since she was en years old, which is about the time she began to menstruate. Now is her trouble. She is able to retain her water perfectly all day, but ght when she goes to sleep, it passes from her involuntarily. This rnal incontinence of urine is common enough in children, the bladder acting, and the urine thus escaping after they retire to rest, but it is ry unusual thing to find it in an individual of twenty. The only other gs that the patient complains of are, a "feeling of weakness through body" when she makes any effort, and very severe headache after oping over. These are obscure symptoms, and need not occupy our e; but the matter of the incontinence of urine is a palpable trouble, it is for this that the young woman comes here to seek relief.

f such a patient should present herself at the office of any one of you, you should proceed to treat her without making a vaginal examination, you would probably prescribe belladonna, and perhaps electricity in addition, and you would be very careful to have her wake at certain intervals during the night in order to evacuate her bladder in the natural way. After a prolonged course of some such treatment, you would probably begin to wonder why she did not get any better; but if you should then make an exploration of the pelvic viscera, the mystery would at once be solved, and the whole case be made perfectly clear.

Let me tell you, then, what was revealed by the examination which I made here. Although the patient said that she had not passed urine fo five or six hours, I found the bladder quite empty, apparently; and thi was proved to be the fact when I passed the catheter. The posterior wal of the bladder was pressed firmly against its anterior wall by means of tumour, which I ascertained to be the body of the uterus in a state of ex treme flexion. By conjoined manipulation I was able to recognize and t rock the uterus in such a manner that the diagnosis was complete withou the introduction of the sound.

But there is something more about the case which has not yet bee alluded to, and that is dysmenorrhœa. The patient stated to me in priva that she always suffers intensely at the time of her monthly period although she did not mention this when I was questioning her before th class in regard to her symptoms. There are, then, two symptoms of im portance which claim our attention in this case, viz.: nocturnal incont nence of urine and dysmenorrhœa; and let us see if the condition of affai revealed by the examination will satisfactorily account for these.

As to the dysmenorrhœa it is not difficult to understand how that shou be one of the symptoms here. The menstrual blood becomes dammed u at the *os internum*, the seat of the flexure, and this excites violent co tractions of the uterus to expel it. Presently a coagulum is driven o and then for a short time the blood finds exit, after which the same thi is repeated, causing the patient a good deal of suffering, until the men strual period comes to an end. In regard to the incontinence of urine may either be caused by the irritability of the bladder, from the consta pressure exerted upon it, so that it refuses to retain urine after a certa limit; or it may be that while volition remains the patient is able to resi the tendency to evacuate the bladder to which the pressure upon it giv rise, and that it is only when sleep comes on and the nervous system los its control of the viscus that it is unable to retain it any longer. But, all events, there can be no doubt that the incontinence is directly attribu able to the anteflexion of the uterus, whose body thus presses with su force and so uninterruptedly upon the bladder.

But, it may be asked, why does not lying upon the back remove t pressure of the uterus from the bladder? Under ordinary circumstanc this would be the case; but here the anteflexion is so aggravated that i stead of relieving the bladder it only increases the difficulty. The bladd seems to be affected by a kind of spasm, and you know how apt spasm to come on during sleep. This is the case with spasmodic croup, a spasm of the neck of the bladder, as a rule, comes on just after the pati has awakened from sleep.

Having thus discovered that it is the direct pressure of the flexed ute upon the bladder that gives rise to the nocturnal incontinence of uri what is required for the cure of the latter? The answer is very simpl Lift the body of the uterus off of the bladder, and then retain it in normal position. But although it is very simple to say, "Lift the ute off the bladder," this is sometimes a very difficult thing to do. In the present instance, however, I think it can be accomplished quite readily. The restoration should be accomplished gradually, or very serious trouble may be set up. Placing the fingers of one hand in the vagina, and those of the other on the abdomen, the fundus should be raised but a short distance at first, after which a little pad of cotton may be inserted to retain it in its new position. The same procedure should be repeated over and over again; and after a time, when the organ can be completely restored o its normal place, a properly constructed and nicely-fitting anteversion essary should be applied, and worn as long as necessary. No medicine hatever would be of the slightest efficacy here, because the trouble is to e looked upon as a purely mechanical one, and I am confident that if we cceed in meeting the indication here presented we will cure the patient; hile if we do not meet the indication, no amount of medication can pos- bly do her any good. This is pre-eminently a case for the hospital, as is almost impossible to treat such a case in this young woman's walk of e satisfactorily elsewhere; and I trust that she will consent to enter my rvice at the Woman's Hospital.

CASE II.—*Large Uterine Fibroid; Chronic Ovaritis.*

Our second patient to-day is Margaret W——, thirty-six years of age, d a native of Germany. She has been married fourteen years, and has er had any children, though she had one miscarriage twelve years ago.

Of what do you complain, Mrs. W——?

"Pain in the back."

How long have you had it?

"About two years."

What else?

"When I walk any distance, or do much work, I get very faint, and d as if somebody had beaten me all over with a club."

Do you ever faint away?

"Yes, sometimes I faint away entirely."

What else do you complain of?

"I do not get my turns as I ought to."

What is wrong about them?

"They do not come at the regular time always, and they do not last g enough."

Do you have much pain at the time of your monthly sickness?

"Yes, I suffer very greatly."

What else do you suffer from?

"Headache."

What else?

"Pains in my shoulder."

What else?

"That is all."

Nothing, gentleman, I assure you, can take the place of clinical teach- g, because, at a clinic, each student has the advantage of hearing the history of a patient just as he might elicit it were the latter consulting him at his own office.

This patient says she has been suffering for two years, and yet she seems o look very well. Still, we have good reason to suspect that she is not perfectly healthy from the fact that she has not been pregnant for twelve years, although continuing all this time to live with her husband, and being desirous of bearing children, as she informs me. Well, two years ago more fibroids is an evidence that she does not enjoy perfect health. This is also pre-eminently the case in regard to ovarian tumours; and these I may say are almost invariably met with among the lower walks of life, where the women live poorly and are obliged to work very hard. Although I have had a large experience with these cysts, I have never had but ten cases under my care in which the patients belonged to the highest classes of society. I am constantly meeting them among the poorer classes, and I have noticed particularly that there is always a depreciation of the patient's health before the tumour makes its appearance at all. This circumstance is not so markedly characteristic of fibroids; but, in general, the same rule applies to these also.

But though it would be entirely unjustifiable to operate in such a case as this, there are other methods of procedure which we may attempt for the relief of the trouble. Most of you are, no doubt, familiar with the extraordinary results which Hildebrandt has met with in the treatment of fibroids by means of the hypodermic injection of ergotin; the latter being merely a refined extract of the drug, and not its true alkaloid principle. In six months, he reports, he has repeatedly reduced a fibroid as large as a man's head to the size of a hen's egg. While I see no reason to doubt the statements of such a distinguished authority as Hildebrandt, however, I must say that no one else seems to have been equally successful in this treatment. This may be, however, because Hildebrandt has devoted more care to the systematic use of this drug than other investigators. In a certain number of cases I believe that the method is one of the highest service; and in the present instance I should recommend that about three times a week her attending physician should inject ten drops of Squibb's fluid extract of ergot somewhere in the cellular tissue of this woman's body. Sometimes ergot used in this way has the effect of producing the most violent uterine contractions; but this is to be avoided, and if it is found to occur, the amount of ergot injected should be diminished. What we really expect from the ergot is such an effect in causing contraction of the arteries that the supply of blood furnished to the tumour will be to some extent cut off, and its nutrition thus more or less impaired. When it is impossible to employ the ergot hypodermically, as is sometimes the case, we may use it either by the mouth or rectum; for although these methods are not so beneficial as the first, they are often of very considerable service. It is always unfortunate for such a patient, as I have previously had occasion to remark, to find out that she has a *tumour;* for women almost invariably associate the most terrible consequences with this word, and the moral effect of the discovery, in spite of the assurances of the physician, is apt to be quite bad sometimes.

CASE III.—*Large Uterine Fibroid.*

We have to-day another patient suffering from fibroid, and I have therefore thought it advisable for her to come in immediately after the one who has just left us.

This woman, whose name is Johannah M——, is thirty-four years of age, and I may remark, in connection with this point, that, although we are liable to meet with uterine fibroids at any period of life, as a general rule they do not make their appearance until the patient is over thirty years old. This patient has been married some years, but has never been pregnant. As to the cause of her sterility, perhaps we shall find out something explanatory presently.

How long have you been complaining?

"Ever since I was married."

In what way have you suffered?

"I do not suffer very much; but when I lie on my back I have considerable pain, and I can feel something like a stone in my stomach."

What else?

"I have a great deal of pain about a week before my monthly sickness comes on."

What else?

"I did have trouble in passing my water; but that is better now."

Is there anything else that you complain of?

"That is all."

Are you able to attend to your ordinary business?

"Yes."

Would you have liked to have a family?

"Yes."

Let me now describe to you, and roughly sketch upon the black-board, hat the physical examination revealed here. In the first place, I found e cervix about in its normal position, and it was as small as we ordina- ly find it in nulliparous women. Above it, however, there was a hard s, as large as a man's head, which pressed in a marked manner upon e bladder in part and the rectum behind. Yet when I ask the patient w she suffers, she replies that she does not suffer much at all; for in her e almost the only symptom that usually seems worthy of attention is e sterility. It is possible that this mass alluded to may have existed for re than seven years; but we can hardly form an opinion in regard to at now, and even if it did, it was no doubt so small as to escape notice tirely.

It is a point of great interest to find out where the uterus lies in this e, and what is its relation to the tumour spoken of; and this is revealed y the introduction of the sound. In this way we ascertain that it is in e anterior portion of the mass, as is usually the case where there is a ge fibroid of this character. The fibroid has no doubt originated in the terior wall of the uterus, and has gone on increasing in size until it has volved the whole of the latter, and caused marked anteflexion.

As to the prognosis here it is exactly the same as in the other case. It mpossible to make a positive one, as we can in certain instances, but ere the prognosis is certain, it is almost invariably bad, as in well- rked carcinoma, for instance. This fibroid presents some worse features n the one in the last case, and it is undoubtedly the cause of the wo- n's sterility. Pregnancy, however, would be the worst possible thing t could happen to this patient; because if she went to full term, the ances are that uncontrollable hemorrhage would occur after the delivery f the child.

What treatment shall we adopt in this case? The same remarks in egard to operative interference which were made concerning the last atient are equally applicable here. As to the irritability of the bladder hich she has mentioned as having formerly troubled her, if it should eturn, I think she will find considerable relief from the wearing of a well-onstructed abdominal bandage, which will to a great extent remove the ressure of the mass upon that viscus. The patient, I learn, is already under the care of a good physician, who has for some time been employing the method of treatment for the fibroid which I should have recommended to him, viz., the hypodermic injection of ergot. She states that for about an hour after the injection she has a great deal of pain and "swells up." These phenomena, I have no doubt, are due to the contractions of the uterus, and also probably of the whole mass of the fibroid, set up by the action of the ergot; and this I have found to be a very frequent result of such hypodermic injections, having noticed it in quite a large number of instances. The pain, she says, does not pass off entirely until after about three hours. Altogether, she considered herself better than she was before the treatment was commenced, and the principal improvement she has noticed is the ease which she now gets at night; whereas she formerly suffered a great deal of pain when she lay down. She loses a considerable amount of blood at the time of her menstrual periods; but the flow does not seem sufficiently profuse to cause any anxiety, In addition to the treatment by ergot, she is also taking appropriate tonics. In regard to the hypodermic use of ergot, I may say in dismissing the patient that it sometimes causes such violent contractions of the uterus that the patient suffers fearful agony; and hence in such cases it is necessary to administer the remedy in some other manner.

CASE IV.—*Retroflexion of the Uterus, with Sterility.*

Our last patient to-day is Emma H——, a native of the United States, and thirty-four years of age. She has been married for fourteen years, but has never been pregnant.

How long have you been sick?

"Well, I have been really sick for six years."

Were you perfectly healthy at the time of your marriage?

"Yes."

What do you complain of?

"Pain in the side and back."

What else?

"I have a bad head. That is, I suffer from pain and dizziness in it, and sometimes feel very faint."

What else?

"I have been unwell for all the last month."

(I wish to pause here for a moment, gentlemen, to impress upon you the importance of always asking "What else" in the examination of patients until you come into possession of *all* the rational symptoms; for, otherwise some very important point may be entirely omitted which might have been of the highest service to you in your investigation of the case. When, some years ago, I conducted a "Diagnosis Class" at Bellevue Hospital, I found it the hardest thing imaginable to get the students to keep on asking this little question, "What else;" for as soon as they received an answer which they thought gave them a clue to the character of the case under examination, they at once started off on a special series of inquiries in regard to the point, and so were often completely misled. Instead of this, the correct way, as I have intimated, is in the first place to get the patient's story complete. But to resume our inquiries here.)

How about your monthly sickness ordinarily?

"I have always been perfectly regular up to the past month."

And since your last period you have been losing blood all the time up to the present.

"Yes."

Do you usually have much pain at the time of your monthly sickness?

"Yes, a great deal."

Do you have the whites?

"Yes."

I suppose you have never done anything to avoid pregnancy.

"No, sir."

Here, you see, is a perfectly healthy woman, who has been married for fourteen years without ever becoming pregnant; and hence we should be inclined to infer that she is not so entirely healthy as she looks. The two principal symptoms in her case we find to be sterility and dysmenorrhœa for the menorrhagia of which she complains is only of very recent origin. In looking back over the four interesting cases which we have seen to-day, you will notice that dysmenorrhœa was a prominent feature in all of them; and yet it is due to an entirely different cause in nearly every instance. In two of the women, you will remember, its cause was uterine fibroids. Twenty years ago, when the study of gynæcology was as yet almost in its infancy, dysmenorrhœa was considered a disease. Now we know that it is just as much a symptom as cough is.

The other symptoms of which this patient complained were, leucorrhœa and constant discomfort in one side; so that the necessity for resorting to physical examination here was obvious. On employing conjoined manipulation, I at once discovered that the body of the uterus was not to be found in its ordinary position, and that there was some sort of a tumour or mass lying back of the cervix. When the posture of the patient was changed, and the probe was introduced, the latter was proved to be the body of the uterus in a state of marked retroflexion; as seemed highly probable from the condition of affairs found before the probe was resorted. Retroflexion is, then, the diagnosis here, because it offers a satisfactory explanation of all the symptoms met with in the case.

In the first place, the sterility is undoubtedly due to it, because such a malposition of the uterus must almost necessarily prevent seminal fluid from passing up into its cavity. But while the entrance of seminal fluid prevented, the retroflexion does not cut off the egress of menstrual blood; though it interferes with it to such an extent that much suffering thereby caused to the patient. The menstrual blood must get out of the uterine cavity in some way; and if it cannot do so by means of the natural exit, it will force a passage through the Fallopian tubes into the peritoneum (as has been known to occur in certain rare instances), and form a "hæmatocele by regurgitation," as it is called. As to the leucorrhœa, that is easily explained by the constant state of congestion, in which uterus is kept by its malposition; and the pain about the pelvis of which the patient complains is due to the tension upon the uterine ligaments and the direct presence of the retroflexed organ, which also gives rise to obstinate constipation of the bowels.

This is undoubtedly the most curable case that has been before us. I should not venture to say to either of the other patients that I could cure her; but here I do not hesitate to assert that the woman can positively be cured without any difficulty. I am willing to make this assertion from the fact that the uterus can readily be restored to its normal position. When the organ has been replaced, therefore, it only remains to maintain it in position by means of an appropriate pessary; although I think the probability of conception would be somewhat increased if the os internum were dilated from time to time with curved sounds. Still, it is best not to be too confident in regard to this point; as sterility is always a very uncertain thing to treat, whatever may be its cause.

CASE OF FEMORO-POPLITEAL ANEURISM, WHICH HAD BEEN LAID OPEN BY MISTAKE, AND IN WHICH THE OLD OPERATION (THAT OF ANTYLLUS) WAS PERFORMED.

A Clinical Lecture Delivered at St. George's Hospital.

By T. HOLMES, F.R.C.S.,
Surgeon to the Hospital.

You lately had the opportunity of seeing a case which is so rare in its occurrence, and which conveyed so many important surgical lesions, that I must recal your attention to it.

The notes of the case may be thus summarized. The patient was a youn man aged 29, a labourer, in fairly good health. He had had syphilis about si years ago, but no secondary symptoms. His habits were, as far as is know moderately temperate. A year ago he fell from a wall about eight feet, and soo afterwards noticed a tumour in the calf of the right leg. No pulsation was eve noticed in this swelling. He was treated as an out-patient at St. Mary's Hospital for three weeks, after which he says that the swelling had quite gone. Fiv or six weeks ago, after a good deal of walking, he was loading a cart with coal when he suddenly felt a sharp shooting pain down the right thigh, with a sen tion as if something had given way about its middle; and half an hour afterward he noticed in this situation a swelling as large as a hen's egg. He went to b and remained in bed for a fortnight, after which he went to a neighbouring i firmary. During this time, the tumour steadily increased in size, but did n pulsate as far as he noticed. On his admission into the infirmary, careful exam nation was made in order to detect pulsation or *bruit*, but neither could be foun The tumour was twice explored with a grooved needle, and only dark-colour blood was evacuated. On the day of his admission into this hospital (March 1879), the tumour was punctured with a knife by the assistant of the surgeon the infirmary. A jet of arterial blood issued from the puncture. The assist plugged the wound with his finger, and sent for the surgeon, who enlarged t incision to the extent of about two inches. This was followed by a very formid able gush of blood. The wound was plugged with lint steeped in perchloride iron, a tourniquet was applied, and the man sent to the hospital. When h arrived, the limb was much swollen, cold, and blue, and the patient much e hausted by hemorrhage.

With this history before me, my impression was that the tumour would prob bly be found to be of a cancerous nature, with a large blood cyst. It was clear either this or an aneurism. In any case, the first thing to be done was to free lay open the cavity. Accordingly, Esmarch's bandage was applied, and an i cision about eight inches long was made, when the cavity was seen to be fille with the laminated clots externally and soft clots in the centre, which are charac teristic of aneurism; and when all these had been removed, it was seen th there was no solid tumour, nor was it very clear whether the membrane whic lined the cavity was a perfect sac or not. I determined to tie the vessel in th sac, and attempt to save the limb. It was by no means easy to find the openin of the artery; but at length what appeared to be the lower part of the sac wa reached, situated quite in the popliteal space, and on tracing this round to it cæcal extremity, it was found to overlap a somewhat indistinct orifice about th size of a No. 10 catheter; and through this opening a probe passed for an unlimited extent downwards. This was accordingly taken to be the lower or distal opening of the vessel, and a silk ligature was tied around it. No proximal opening could be found, however, in this situation; but on trying to trace the continuity of the vessel upwards, the great sciatic nerve was seen exposed for about three inches. Afterwards, the artery was looked for at the upper part of the tumour, and here an opening was found, from which the probe passed easily in both directions—upwards and downwards—and it was quite easy to dissect the vessel out from the neighbouring tissues. A ligature was passed round the artery both above and below the orifice, and then the bandage was taken off. No bleeding followed, except from a few insignificant vessels in the sac. These were tied, nd the cavity was filled with carbolized lint, the wound being left open. When e bandage was removed, warmth began to return to the limb, which was then veloped in cotton-wool, and the patient put to bed. The operation was a pro- acted one, lasting about an hour. His circulation was occasionally so low that was necessary to suspend the anæsthetic.

I have been thus particular in describing the operation, because it is one rarely n; but I need not detain you very long with the future progress of the case, pecially as you have access to the copious notes and accurate drawings which clinical clerk, Mr. Dale, made of it. The warmth and sensation of the foot first seemed to return, but soon the whole dorsum of the foot began to slough, the walls of the large incision also sloughed to a very great extent. When this er slough cleared away, all the ligatures dropped off except the one tied on the ximal end of the artery, and the pulsation in the vessel could be seen down his ligature on the eighth day after the operation. This ligature held on till eighteenth day, when it came away without any hemorrhage. Meanwhile, sloughing on the leg and foot extended and deepened; but the man remained from any alarming general symptoms, and his complexion gradually regained ore natural hue. Amputation was delayed till April 3d, at which time all soft parts on the dorsum of the foot had come away, exposing the tarsal es, the joints between which were widely open, but the skin remained on the of the toes. The gangrene of the skin had not spread beyond the level of middle of the leg, so that it was hoped that a stump could be formed below knee; but on cutting into the parts there to form the anterior flap, the mus- were found so rotten and so infiltrated with foul matter, that this idea was en up, and I amputated through the knee-joint, leaving the patella, as I be- ved that the parts forming the stump (which appeared perfectly healthy) would ive sufficient nourishment from the branches of the superficial femoral and funda arteries; but in this I was disappointed. All the parts forming the rior flap sloughed *en masse;* the end of the femur was freely exposed, with rtilages; and so the unfortunate patient was condemned to a third operation. r the amputation, he suffered for a time from considerable shock; but this ally subsided, and he seemed doing well; when, on May 15th, he was d with a sharp attack of hæmaturia, for which there was no apparent cause. antiseptic dressings were used during the whole case, and only occasionally tle weak carbolic lotion to syringe the sloughy cavity. The hæmaturia, howr, passed off as it had come, though occasional sickness seemed for some days testify to some kidney-irritation. At length, on June 6th, he seemed well ugh to bear the removal of the exposed bone. Accordingly, I removed the ella and about four inches of the lower part of the femur, by simply pushing m through the remains of the great incision at the inner part of the thigh. e parts consolidated slowly round the end of the femur; and he left the pital July 16th. He was seen again Aug. 9th, with the stump nearly healed.

Besides several minor points of interest, this case presents these two questions primary importance: 1. How far was the original error of diagnosis avoidable, r, in other words, how far was the treatment pursued prior to the man's admision censurable? and 2, Was the course which I followed the right one?

As to the first point, the history is no doubt a remarkable one. In the seventh volume of the *St. George's Hospital Reports*, I wrote a paper on the Diagno of Aneurism, in which I collected and commented on most of the recorded case of failure of diagnosis, in which I showed that almost all of them proceeded fro negligence in examination, for that there was clear evidence that in the gre majority the tumour had never been auscultated. At the same time, I adduced proof—and amongst others a striking case under my own care—to show tha there have been cases of aneurism in which the most careful palpation and auscultation have revealed neither pulsation nor *bruit*. The practical caution whic I deduced from these histories is the following. "Fluctuating tumours in th neighbourhood of large arteries should never be opened (unless they are visib and unmistakably abscesses) without a previous careful examination of the history, their pulsation, their *bruit*, the effect on them of compression of t main trunk if possible; and finally, in case the doubt remains, an explorato puncture. If this very common-sense precaution were observed, we should h less of mistaken diagnosis in aneurism." You will possibly say that this is novelty. I can only reply that the observance of this precaution would ha saved many a life and many a surgical reputation. But in the case before all this had been done, except perhaps the experiment on the effect of press on the femoral above the tumour, which, however, ought never to be omitted a doubtful case. The paper in question contains distinct proof of its high di nostic value.[1] With this reservation, I do not see what more could have b done to establish the diagnosis. As to the treatment pursued at the infirm it might be perfectly correct up to a certain point. I am unable to estimate indications for laying open the tumour, as I did not see the patient; but easily understand that they might have been, and very probably were quite s cient. It was evidently increasing, and seems to have been producing consid able obstruction to the venous circulation. But I cannot help thinking— this I wish strongly to impress on you as a practical caution—that when it judged necessary to make an incision into a tumour of doubtful nature situ on the course of the main artery, and which had been previously twice explored with the result of showing that it contained blood, and, as far as we know, blood only, no incision should have been made without ample preparation for the ulterior proceedings, which are so likely to prove necessary; *i. e.*, amputation or the ligature of the artery. You saw the dangerous condition to which this man had been reduced, even after the short journey to this hospital, and you could easily imagine what would have been the consequence of a similar accident in a remote part of the country.

---

[1] The passage to which I chiefly refer is the following (*St. George's Hospital* *ports*, vol. vii. page 181). The case is reported in Pirogoff's *Klinische Chirurgie*. man who had before suffered from a phlegmonous abscess in the thigh, and who rheumatic, presented himself with a large inflamed swelling, indistinctly fluctuat below the pectoral muscles and in the axilla. Not doubting that it was an absc Pirogoff had the scalpel in his hand to open it, when it occurred to him to auscult the swelling. A low *bruit* revealed the true nature of the case. The symptoms are very fully given; but the subclavian was ultimately tied. The patient died, and, dissection, it was found that there was a small opening in the axillary artery, and swelling consisted of blood extravasated under the pectoralis minor. From these ca Pirogoff deduces the practical rule, never to open a deep-seated swelling, howe plainly it may fluctuate, without previous auscultation, though he points out t *bruit* may exist in swellings which are not aneurismal (such as medullary canc and that in swellings which are in all probability aneurismal, the *bruit* may only audible in parts. He thus sums up the whole subject: 'If I were asked what I hold most decisive of the existence of an aneurism which does not pulsate, I m confess that, if there be no *bruit* to be heard at any part of the tumour, I know of other than these two—(1) collapse of the swelling, sometimes only to a slight ext when the main artery is compressed between the heart and the tumour; and (2) if pulsation of the artery can be felt upon the surface of the tumour, an unnatural tension of its impulse; for example, over twice the usual breadth of the vessel. in order to satisfy one's self of these two phenomena, it is, of course, necessary to amine the case repeatedly, and with the greatest attention. The diagnosis must be founded on a single examination.'" Reference may also be made to a paper aneurisms which do not pulsate, by Mr. Morrant Baker in the new (15th) volume *St. Bartholomew's Hospital Reports*.

Next, as to the treatment which I pursued. To a certain extent, it was suc- essful, as the man escaped with his life. But it is clear that if the thigh had been putated at once, he would have been exposed to far less danger, and would, in probability, have recovered some months sooner. Yet I am not on that count inclined to admit that I was wrong in performing the old operation, and giving the patient a chance of preserving his leg. True it is, that the previous of blood and the œdema and coldness of the limb resulting from the pro- ged compression rendered success improbable; but I think the attempt was justifiable one. I am, however, free to admit, that, when I was forced to ampu- e. it would have been better to do so at the level of the upper ligature on the oral artery. This would have saved the man some weeks of suffering, and en him probably a better stump.

I was hardly prepared for the difficulty which I experienced in finding the ce of the artery in the sac. Even now, I must confess that I could not de- be the state of parts with any confidence in the accuracy of my description, explain by what I found at the operation the singularities of the previous tory of the case. That the upper ligatures were tied on the femoral artery plain, both from the fact that it was really dissected out of the tissue of the at the time of the operation with something approaching distinctness, and from the fact that after the separation of the sloughy walls of the cavity, the ery could be seen pulsating down to the ligature in this situation. But I con- to entertaining very great doubt whether the ligature which was first tied really placed on the artery at all. I regard it as more probable that there a rent in the sac through which the probe passed, and that what I tied around probe was really a portion of the sac itself. If you consult the history of a in which Mr. Syme laid open an aneurism in the iliac fossa, and believed elf to have tied the common, external, and internal iliac arteries (*Med. Chir.* *s.*, vol. xlv.), you will find that only the external iliac was really tied, one the ligatures having probably been placed on a portion of the sac, and the r two on the external iliac above and below the opening. Nor is such an at all surprising. It is not always an easy matter, even on the dead sub- , to dissect out the artery from the interior of the aneurismal sac; and on the g, besides the necessity of some reasonable speed, even when the circulation completely commanded, there are many sources of fallacy from which the dis- tion of the parts after removal from the body is free. As far as I could judge, wever, I should conjecture that the femoral artery had given way, either com- tely or nearly so, somewhere near the opening in the adductor magnus, and e blood had poured into the cellular tissue of the limb (both in the thigh and pliteal space), making for itself an imperfect sac. At the upper part this sac emed more firm and membranous; at the lower, it was less distinct and very obably wholly deficient at the part where the sciatic nerve was seen. If we dopt this view, it would get rid of one of the most difficult questions in the se, viz., why was there no pulsation? I have already, I think, insisted suffi- ently (both in my paper above alluded to in the *St. George's Hospital Reports* and in other writings on Aneurism) on the indubitable fact that in almost all cases of mere rupture of an artery without the formation of a sac, pulsation is absent. *Bruit*, too, appears sometimes to be absent, or at least not to be heard; for it is possible that in some of these cases at least the *bruit* has been low and only audible over a limited part of the tumour, and so has been missed (see Pirogoff's cases quoted in my paper). The former appearance of a non-pulsating tumour in the same situation which disappeared without any further symptoms is strange, and I cannot offer any probable explanation of it, unless it may be that a small rent then formed in the artery which closed spontaneously.

The rupture of an artery at a comparatively early age and without proof of general disease of the arterial system is, I dare say, rare; but I do not think it is so rare as is often believed. I have seen several cases which hardly admitted of any other explanation, and there is a preparation in our museum which bears so great an analogy to what I believe occurred in our patient, that I have thought it right to bring it into the lecture-room.[1] It shows the common carotid artery, in which, just below the bifurcation, there is a small opening leading into an enormous sac in the cellular tissue. The patient's age was the same as that of the subject of the present lecture—twenty-nine. The rupture occurred from no known cause, as he was at his ordinary work—that of kneading bread. The first symptom of it was a diffused swelling, which gradually became circumscribed and pulsated with a whirring sound, then became again diffused, and lost its pulsation. No operation was undertaken, and the patient died of suffocation. The history is rather incomplete, as the case occurred thirty-five years ago, before the present system of recording the histories of all cases along with their *post mortem* examinations was commenced. In this preparation, there are one or two small patches of atheroma near the orifice of the sac, but the chief part of the artery is healthy. You will at once see in how many respects the history of this case resembles that of our present patient. An artery gives way without known cause; a diffused swelling is the result, which pulsates when the sac is entire, but loses pulsation when the sac bursts. In the case which furnished the preparation, the old operation would have been, to say the least, very difficult, and might have proved impossible. But if it could have been completed without fatal hemorrhage, it would doubtless have saved the patient's life.

The lessons which the present case teaches may be summed up as follows: 1. It affords another example of the occasional existence of aneurisms (so-called) which do not present the ordinary symptoms of pulsation and easily recognized *bruit*. On this subject I have said as much as I usefully can in the paper to which I have already referred you. 2. It shows the difficulties and ambiguities which surround the old operations when performed in such cases. The cases usually present a large ill-defined and probably imperfect sac and a relatively very small arterial opening. 3. It shows the danger of meddling with tumours of this sort, unless the surgeon is prepared with all the appliances and assistance which he will require in order to undertake the formidable operation which may become necessary. 4. It shows how probable gangrene is in such cases, in spite of the evacuation of the contents of the tumour, and although only a small part of the artery may have been included between the ligatures. 5. It is an interesting example of the fact, so often noticed in gangrene occurring after ligature of a main trunk, that the visible destruction of skin and superficial parts does not always give a just idea of the extent to which the deep parts may be implicated, if not in absolute gangrene, at least in a low unhealthy degeneration; and therefore how much better it is in such cases to amputate through or near the level of the highest ligature.—*Brit. Med. Journ.*, Jan. 10, 1880.

MONTHLY ABSTRACT.

Anatomy and Physiology.

Coagulation of the Blood.

Amongst the many researches that have been made in regard to the phenomena presented during the coagulation of the blood, comparatively few have been devoted to the precise determination of the time at which it occurs after removal from the vessels. Thackrah, in his well-known work, estimates it at from five to ten minutes for the horse, two to ten minutes for the ox, one minute to one minute and a half for the sheep, half a minute to one minute for the bird, one minute to three minutes for the fish, and two to four minutes for the frog. Nasse found the order of rapidity of coagulation in domestic animals to be the horse, goat, dog, ox, pig, sheep, and rabbit; but K. SCHOENLEIN has recently shown, in an article contained in the *Zeitschrift für Biologie*, that many circumstances render these statements unreliable. No distinction was drawn between the first appearance of coagulation and the solidification of the entire mass. No control experiments were made with other and similar quantities of the blood, and many precautions were neglected which experience has shown are requisite that the time of the coagulation should be rightly estimated. He has himself adopted a plan originally suggested by Vierordt, which consists in pricking the finger, and dipping into the drop of blood which escapes a capillary glass tube with thin walls, having a diameter of about one millimetre and a length of about half an inch. Into the other end of the tube, which is open at both ends, is inserted a white horsehair, thoroughly purified and cleansed by boiling in alcohol and ether. At first it will be found that on withdrawing the hair for a short distance no blood adheres to it, but as soon as coagulation has commenced small red coagulated portions of blood adhere to it, and can be removed with it from the tube. The coagula are very often thicker than the lumen of the tube, and thus show that they adhere very firmly to the hair—much more firmly, indeed, than to a glass tube. A small quantity of uncoagulated blood usually remains in the tube, which, even if it be churned with the hair, refuses to solidify. In some salamanders and tritons the process of coagulation takes place with so much energy that serum is almost immediately squeezed out of the newly formed clot. In most of the lower animals Schoenlein snipped a small piece of skin from the back after the hair had been removed by shaving; but in frogs the heart was excised and the blood obtained from it; and in fishes the gills were used as the source of supply; whilst in birds a feather was pulled out. By practice he was able to obtain the blood in the glass tube with the horsehair inserted in the course of from ten to fifteen seconds, and the time was always taken from the moment when the blood escaped from the bloodvessels.

The valuable part of Schoenlein's paper is a series of tables in which he notes the name of the animal from which the blood was taken, its sex, and weight, the temperature of the air at the time of the observation, and approximative numbers in seconds of the time of commencement and termination of the act of coagulation. We extract some of the results at which he has arrived. In the barbel (Barbus fluviatilis) in one instance coagulation began in the blood in 185 seconds after it had escaped, and was completed at the expiration of 205 seconds, the whole period occupied being twenty seconds. In other instances the tim of commencement was 125 and 95 seconds, and the duration of the act was 2 and 50 seconds. In the Triton cristatus the commencement of coagulation varie from 55 to 265 seconds after withdrawal, but in the former case it was complete in 20 seconds, and in the latter in 30 seconds. One of the slowest kinds of bloo to coagulate was that of the Anguis fragilis, or blind worm, which did not begi to coagulate till after the lapse of 585 seconds, or nearly ten minutes, but eve this was exceeded by a specimen from the Coluber natrix, or ordinary snake which began to coagulate only after 1295 seconds, or more than twenty minute and was 410 seconds in becoming solid. This animal was, however, pregnant A long list of birds is given, including the sparrow, starling, crow, woodpecke pigeon, crane, swan, and others. In these the period of commencement of coag lation varied considerably, even for the same species—namely, from 75 to 4 seconds; in a large number the coagulation was completed in from 50 to seconds, but in a few it lasted two minutes or more. In the mouse and rat th beginning varied from 85 to 245 seconds, and it was completed in from 50 180 seconds. Guinea-pigs presented similar variations. Ox blood varied fro 37 to 555 seconds in beginning to coagulate, and from 90 to 210 seconds in com pleting coagulation. In man the commencement of coagulation varied from 1 seconds after withdrawal from the vessels, to 515 seconds, and the completi occurred at times varying from 3 to 10½ minutes. It will thus be seen that ve remarkable differences are observable in the time of coagulation of the blood i different animals, the limits of variation differing frequently 10 to 20 per cen for the commencement of coagulation, as well as for its termination, and in so instances very much more.—*Lancet*, Feb. 21, 1880.

Materia Medica and Therapeutics.

The Materia Medica of Antiseptic Surgery.

In an interesting lecture published in the *American Practitioner* (March, 188 Dr. JOHN CHIENE, Surgeon to the Edinburg Royal Infirmary, gives the follow description of the armamentarium used by Mr. Lister in his practice of antisep surgery.

The best form of carbolic acid to employ is the absolute phenol of Mess Bowdler and Bickerdike Church, Lancashire. Its advantages are that it has objectionable odour, is readily soluble, and does not irritate the operator's ski while the more crude and impure forms met with are occasionally so disagreea and harsh that some of the German surgeons anoint their hands with vaseli before beginning work, in order to obviate this inconvenience.

Among the various preparations of carbolic acid we may first take up the sol tions. There are two watery solutions—strong and weak. The strong consi of one part of acid crystals in twenty parts of water. It is used for washi and purifying the skin and instruments; for soaking sponges, drainage-tube and horse-hair; and for the steam spray. The weak, which is half the streng of the strong—one part of the crystals in forty parts of water—is required f washing the sponges during an operation, for soaking the "deep dressing," an for dressing generally. These lotions should be filtered after making, and ha better be kept in large, blue, glass-stoppered jars carefully labeled.

An alcoholic solution of the strength of one part of the acid in five of spirit wine is employed for cleansing wounds seen a few hours after injury, and speciall for those cases in which dirt and foreign matter have obtained access to the tissues.

There are two oily solutions. The weak—one part of crystals in twenty of olive oil—is used for purifying and lubricating urethral bougies, sounds, and catheters immediately previous to their introduction; the strong—of one part in ten—for applying to exposed dead bone, in situations where we cannot at once remove it, but have to leave it for some time *in situ;* for example, in necrosis of the flat bones of the skull-cap. In such cases a piece of lint soaked in the oil is laid on the bare bone and covered with a piece of gutta-percha tissue.

Antiseptic gauze is prepared by charging unbleached muslin of open texture ith the following mixture (New Formula, 1879): crystallized carbolic acid, e part; common resin, four parts; solid paraffin, four parts. This last pre- nts adhesiveness. Paraffin does not blend at all with carbolic acid in the cold, d therefore simply dilutes the moisture of carbolic acid and resin, without inter- ing in the least with the tenacity with which the resin holds the acid. The acid only given off in sufficient quantity when the gauze is moist and at the tem- ature of the human body.

To charge the gauze the paraffin and resin are first melted together in a water h, after which the acid is added, and all are stirred together. We have now diffuse this equably through the cotton cloth; and this requires, first, that the ze be at a higher temperature than the melting-point of the mixture; and ndly, that it be subjected to pressure after receiving it. The gauze is there- heated in a trough, and as layer after layer is turned over the hot mixture is irted on by means of a large metal syringe furnished with a series of perfora- s at the end. Finally, a large heated block is allowed to descend, which urately fills the trough and subjects its contents to pressure. The quantity of d mixture employed should be somewhat less in weight than the amount of ze.

The prepared gauze is used for the large superficial dressing; in loose pieces padding and dressing irregular surfaces; for bandages; and also when wet, ng out of one-to-forty aqueous solution, for the "deep dressing."

Mackintosh consists of thin cotton cloth having a layer of india-rubber water- ofing on one side. This should be evenly applied and continuous, so that the erial is quite impervious. There must be no pin-holes in it.

otective is made of oiled silk, coated on both sides with a thin layer of copal ish, which renders the silk impervious to the carbolic lotion. Over this again e layer of carbolized dextrin is laid, which allows the one-to-forty lotion, which the protective is dipped immediately before use, to wet, and so thor- ly purify the surface. The protective is neither aseptic nor yet antiseptic; e the necessity of making it so before application. Its action is thus purely tive. It keeps the edges of the wound clean, moist, and free from the irri- g action of the antiseptic employed, which, owing to the copal varnish, can- penetrate to the wound; allows discharge to escape readily from under it the dressing; does not adhere, and so is easily removed when necessary.

Carbolized catgut is thus prepared: To twenty parts of carbolic acid crystals two parts of water, and to this again add one hundred parts of olive oil. e this mixture in a flask, and in this put several skeins of catgut. These ld be kept, by means of a few glass marbles or rods, above the level of the ery deposit which occurs. Seal the flask hermetically and set them aside in ol place. The gut must not be used until five or six months after this, and e longer it has been prepared the better.

Carbolized silk is prepared by immersing a reel of silk in melted beeswax containing about one-tenth part of carbolic acid. The silk is drawn through a dry cloth as it leaves the hot fluid, to remove the superfluous wax.

All these various requisites should be kept by themselves apart from all other dressings—the gauze in a tin box; the silk in a stoppered glass jar; sponges, drainage-tubes, and horse-hair in wide-mouthed jars of one-to-twenty lotion; and the gut in its oil.

The various forms of steam sprays employed are constructed on the principle of Adams's steam inhaler. The boiler should be strong, dome-shaped, and furnished with a safety-valve. It is filled by an aperture situated at the lower level of the dome, so that in filling this space is left clear for steam alone. It is a disadvantage when the boiler is filled at the very summit; and in hospitals sufficient care is often not exercised, the steam dome is encroached upon, and a jet of boiling water is thus thrown out in place of spray. The steam-pipe, provided with a stop-cock and ball joint, passes forward from the top of the dome and ends in a fine point, through which the steam rushes with great force. United to the under surface of the steam point, at an angle of forty-two degrees, we have the carbolic point continuous with the upper extremity of the India-rubber tube which leads up from the reservoir of one-to-twenty lotion. As the steam rushes out over the carbolic point it creates a vacuum, and the lotion thus sucked up is driven off in a fine cloud of vapour which covers an area large enough for any ordinary operation, and which is quite respirable, not wetting, and effective at a distance of at least four feet.

On arriving at a patient's house we fill the spray with boiling water up to the base of the dome; never above this; and so we avoid the danger, as I have remarked, of having the upper point blocked by particles of dust carried along in the jet of water, which would ensue were the boiler overfilled. We light the lamp, noting that the wick is in good order and that there is a sufficiency of spirit. We judge that steam is up if it escapes with great force and if it has a distinctly blue colour, when we shut off all carbolic acid, which may readily be done by compressing the carbolic tube with the fingers, and so seeing steam alone. One has also the peculiar rushing sound, the smell and taste of the spray to guide him in ascertaining if all is in working order. A small filter formed of a piece of sponge, inserted into the lower extremity of the carbolic tube, and secured in position by means of a gauze cap, will prevent the lower point from getting choked with dirt, which, falling into the open jar of acid, may be sucked up, and so cause trouble. Should the spray cease working, we may unscrew the points and affix the reserve pair found in the hollow handle, the wound being meanwhile protected by a "guard" consisting of a rag or piece of gauze soaked in lotion. In this way operative procedure is not hindered, and the defaulting points may be seen to and cleaned out with a horsehair or fine silver wire at a more fitting time. This is an accident which hardly ever occurs in private practice.

The other antiseptics employed are—

A solution of chloride of zinc (forty grains to the ounce of distilled water), introduced by the late Campbell de Morgan. It is chiefly used to brush over the cut lips of incisions and wounds in regions which we cannot hope to keep aseptic, as in excision of the upper jaw or lateral lithotomy. We may leave our dressing of strips of lint soaked in this solution *in situ* for forty-eight hours, so potent is this salt; and in this way, thanks to its searching character and non-volatility, the pain and unrest of dressing is avoided, and a dangerous period, during which blood-poisoning from absorption might take place, is tided over. Considerable smarting and pain ensue after application, and this continues for a varying period, according to the temperament of the patient. The use of chloride of zinc for purifying ulcers will be referred to shortly.

Boracic or rather boric acid is used as lotion, lint, and ointment. It is non-volatile, very unirritating—in fact the least so of all antiseptics—but is not at all searching. It may prevent, it can hardly eradicate putrefaction. The lotion of one part of the crystals in thirty parts of water is coloured red with litmus, and thus at a glance we may distinguish it from other lotions. It is used for moistening the boric lint and for washing sores.

The lint is prepared by soaking ordinary surgeon's lint in a boiling saturated solution of boric acid, coloured red with litmus. It is allowed to cool, the lint is ung up to dry, and the remaining fluid poured off and used as boric lotion. The lint is of a pink hue, and glitters with the soft, flat micaceous crystals. In similar manner we may charge bibulous paper or the paper lint introduced by essrs. Wyeth, of Philadelphia. We moisten the boric lint with boric lotion fore application, and this for the same reason as we also soak the deep dressing f gauze or the protective in carbolic lotion. The surface of the material may covered with germs of all kinds, because the antiseptic is not acting. We stroy these organisms by our active lotion, and as the aseptic discharge finds its y afterward into the dressing it dissolves and sets free quite enough of the ored up agent to render itself also antiseptic.

Boric ointment may be prepared by rubbing up one part of finely levigated ic acid in five parts of vaseline. It acts as a sort of antiseptic protective, and specially useful in the treatment of wounds in the face, where it allows the charge to escape, keeps the wound sweet, and never adheres.

An emulsion of salicylic acid in one-to-forty carbolic lotion was introduced by . Lister for the purpose of checking the chemical changes which may take ce under dressings which have been left unchanged for some time. These nges, due to a chemical action between the gauze and the discharges under the sweat, etc., give rise sometimes to a troublesome irritation and eruption, merly dubbed *eczema carbolicum*. A very little salicylic cream smeared on surface of the protective or deep dressing effectually disposes of this.

—

Iodide of Potassium and Calomel in Ocular Therapeutics.

Dr. W. Schlæfke directs attention (*Arch. f. Ophthal.*, xxv. 2) to the danger dusting the eye with colomel while the patient is taking iodide of potassium rnally. He shows (1) that the latter drug enters the circulation and pene- tes to every part of the system with great rapidity; its presence in the various ections, more particularly in the tears, may be demonstrated in a few minutes administration. (2) That when iodide of potassium is being taken, even ly to the extent of seven or eight grains twice daily, it is constantly present the tears in demonstrable quantity. (3) That calomel, though only very ingly soluble in water, dissolves ten times more freely in a ¾ per cent. solution common salt. (4) That calomel, when dusted on the conjunctiva, is dissolved some extent, and unchanged, in the lachrymal secretion, and then acts as a emical agent. (5) That when calomel comes into contact with tears contain- iodide of potassium in solution, iodate and iodide of mercury are formed.) That both of these substances are soluble in the presence of iodide of potas- um or common salt, and that when so dissolved they have a powerful caustic ect on the conjunctiva and excite violent inflammation therein. (7) That for foregoing reasons the external use of calomel should be avoided so long as the rs show traces of the presence of iodide of potassium.—*Glasgow Med. Jour.*, arch 1880, from *Centralblatt f. d. Med. Wiss.*, Jan. 21, 1880.

Pyrogallic Acid as a Remedy in Skin Diseases.

During the year 1879 experiments have been made at Vienna, Paris, Breslau, and elsewhere with ointments containing pyrogallic acid instead of chrysophanic acid, and with good results. Psoriasis is the disease in which it has been chiefly used, and the most convenient strength has been found to be that of one in ten. Most of those who have tried it—for instance, Professor HEBRA (*Wiener Med. Presse*, Nos. 43, 44, 1879) and Professors BESNIER and VIDAL of the St. Louis Hospital (*France Médical*, March 12 and July 5, 1879)—prefer the remedy to chrysophanic acid. They find that, though its action is slower, it has the advantage over the latter in exciting scarcely any inflammation in the part to which it is applied, and in staining it but slightly, the brown colour produced by it quickly disappearing. Its price is also said to be less than that of chrysophanic acid. Hebra finds that a patch of psoriasis treated with pyrogallic acid ointment takes from one to three weeks to disappear. He has used it also in tinea tonsurans, in lupus vulgaris, and in syphilitic papular eruptions. The lupus nodules are destroyed in about three days, probably, as we shall see directly, owing to the affinity of the acid for oxygen.

Hebra has never yet seen any poisonous symptoms follow its application to the skin, although in his cases it could always be detected in the urine. A case has, however, been lately reported by Dr. A. NEISSER (in the first number of Leyden and Frerichs' *Zeitschrift für Klinische Medicin*), where a patient died from pyrogallic acid poisoning in the skin clinic at Breslau. He was a robust man suffering from psoriasis of the whole body, and was certainly not experimented on with much caution. One half of his body was painted with chrysophanic acid, the other with 10 per cent. pyrogallic acid ointment. Six hours after, he had a severe rigor attended with vomiting and collapse. The symptoms then subsided, but returned in about forty hours, and from that time he never rallied, but became comatose and died on the fourth day after the painting. The peculiarity of his urine, of which he only passed about one litre and a half during his illness, attracted attention. It was dark brown, and deposited a thick sediment, which consisted of a very abundant blackish-brown substance, partly amorphous, and partly in the form of drops or casts, but it contained no blood-cells. The spectrum showed the characteristic bands of hæmoglobin, and similar *débris* to that in the urine was found in the blood itself and in the renal tubules. There could be no doubt, in fact, that it consisted of disintegrated red corpuscles.

Dr. Neisser now experimented on rabbits both with chrysophanic acid and pyrogallic acid, and, after proving the harmlessness of the former, discovered that the latter, in moderately poisonous doses, causes rigors, dyspnœa, tremor of the limbs, general weakness, and hæmoglobinuria, with the same changes in blood and urine as were found in his patient. The animals may recover if the dose is not excessive, but with a large dose they die with all the above-named symptoms plus the alterations of the blood corpuscles, but there is no hæmoglobinuria. With a very large dose (two grammes of acid per kilogramme of body weight), to which they generally succumb in about two hours, there is neither hæmoglobinuria, nor can disintegrated blood-cells be detected in the blood; the latter, however, is either blackish or chocolate-coloured, and sometimes of the consistence of jelly.

Dr. Neisser explains the poisonous action of the acid on man and animals by its avidity for oxygen in the presence of alkalies, and the consequent destruction of the red blood corpuscles, which are the carriers of oxygen. The hæmoglobin thus set free is dissolved in the plasma of the blood, and the corpuscular *débris* remains suspended in it, and is in part excreted by the kidneys. He considers that the infarction of the latter does not directly cause death by retention of the urinary constituents in the blood, but by delaying the excretion of the pyrogallic acid from the system, and so prolonging the period of its deoxidizing action. It seems to us, however, that where death follows maximal doses it must be directly due to so large a destruction of red corpuscles that those which still remain intact are unable to satisfy the need of the organism for oxygen, and there is not even time for the appearance of hæmoglobinuria. Dr. Neisser considers that the external use of pyrogallic acid should be restricted to the head and face, chrysophanic acid being still retained for the skin of the trunk and limbs. Theoretically, transfusion with simultaneous venesection would be the rational treatment of the poisoning, and active measures should be taken as early as possible to promote uresis, and clear the renal tubules of *débris*. After all, however, the number f individuals liable to be poisoned by pyrogallic acid may be limited, just as the umber of those who die from chloroform is; but there is no doubt it is a drug hich cannot be safely played with.—*Med. Times and Gazette*, Jan. 31, 1880.

Medicine.

ases of Rheumatic Fever treated with Salicylate of Soda, and terminating Fatally.

Dr. GOODHART, at a recent meeting of the Clinical Society of London, read es of a case of acute rheumatism treated by salicylic acid, and terminating lly. The patient was a servant girl, aged seventeen, with a history of gout d rheumatism on the father's side; but she had always been healthy, except t she suffered from nasal polypi, and had been three times operated on for t affection, the last time fourteen days before her fatal illness. She had had rlatina long ago. After the last operation for the removal of the nasal polypus, e felt faint and weak, but continued at work for a week, when one morning she plained of pain and stiffness of joints, and had headache, anorexia, but no r or vomiting. She was treated for rheumatic fever and got better, but psed in two days and came to the hospital. She was a dark-complexioned l with flushed face and bright eyes; tongue was red at edges, with a white fur the dorsum, and rather dry. The ankles, knees, wrists, and elbows were h swollen, the skin pinkish. The phalangeal joints were also swollen. Preial dulness increased; apex beat normal; pericardial subsultus at base; temature 103°; pulse 120. Bicarbonate of potash was administered in half-drachm a, in acetate of ammonia, every three hours; with five grains of Dover's der night and morning; and milk diet. Next day the area of precordial ess reached to second intercostal space, across from sternum to nipple, and wards to the sixth cartilage. The impulse was in its normal position; the on regular; the sounds very distant and thick at the base, but there was no it. The lungs were normal; urine of specific gravity 1021, not albuminous. e appeared to have a good deal of precordial distress; was sweating freely; d the joints were still painful. The temperature had gradually fallen from 0° to 100°. The alkaline mixture was continued, but at 6 P. M., as she still med in much pain and the temperature was rising again, though very slightly 0.4°), she was ordered fifteen grains of salicylic acid every three hours in its ce. She was seen by Dr. Goodhart at 9 P. M., and though still in a good al of pain and restless, the pulse was still at 120, and there were no particuly serious symptoms. But after this the pulse became much accelerated, eaching 160, and the patient died quietly and suddenly at 3.45 A. M. She had taken four doses of salicylic acid, sixty grains in all, the last dose three-quarter of an hour before death. She passed a restless moaning night, but did not seem unusually ill, nor was anything unusual noticed till her death.

On inspection, the heart weighed nine ounces and a half; there was muc ecchymosis of the pericardium, and patches of recent lymph in several places but no fluid. The muscular tissue of the ventricle showed one or two points o fatty degeneration, but was otherwise healthy, and the ventricle was not dilated The valves were practically healthy, beyond a grain or two of lymph on th mitral. The right ventricle was distended by clots of post-mortem formatio continuous with similar clots in the pulmonary artery. The small intestine wa much ecchymosed and congested, and the joints all contained abundant yello synovia with coagula of yellow lymph, especially the knees and hips. All th bones were normal, special search being directed to the sphenoidal, ethmoidal and frontal sinuses in the region of the recent operation.

The first appearance of the patient, her dry skin, and her restlessness argue badly for her recovery, and suggested the possible event of hyperpyrexia, but the temperature progressively fell, and rheumatic sweating became established these apprehensions subsided, and the case assumed the characters of an ordina attack of acute rheumatism of by no means severe type. Sudden death w therefore an unexpected event, and the question was, Is the result to be attri uted in any degree to the salicylic acid treatment? Dr. Goodhart thought th possible, but did not wish to press that opinion unduly, in the face of facts whi rendered the question a very open one. 1. An early pericarditis was prese and this with the fatty change, though slight, might have sufficed to determi the cessation of the heart's function. 2. It might be suggested as possible th in the four hours' interval between being seen by any skilled assistant and death, the temperature might have risen rapidly and death occurred from hyp pyrexia. 3. The clot in the pulmonary artery might have been embolic. as to the first view, the change in the heart-wall, and especially the absence dilatation, did not seem sufficient to explain sudden death; as to the second, temperature chart was one of almost progressive fall; and, thirdly, the charac of the clot and its continuity with that in the ventricle justified the rejection any hypothesis of pulmonary embolism.

Dr. Goodhart then discussed the possibility of death being due to the rheuma *materies morbi*, or to the sixty grains of salicylic acid, which had been admi tered. Acute rheumatism was a very treacherous disease, especially in yo adults; but before the introduction of the salicylic treatment his post-mort experience led him to the conclusion that death was associated in some cases w hyperpyrexia, without obvious tissue change; in others with pleuro-pneumo pulmonary œdema, and *severe* cardiac complications; occasionally, and compa tively rarely, with acute dilatation of the heart. Since the introduction of s cylic acid, he had seen three cases where death was sudden, unexpected by t physician in charge, and in which the inspection did not discover any changes the viscera sufficient to cause death. Was it a coincidence that these cases h occurred since? All the three were girls or young women, and in all it wa first attack. Coming, as this case did, the last of the three, determined him bring it forward, as one, possibly, in which salicylic acid had acted prejudicia in a manner and with a rapidity hitherto unrecognized. This was the m necessary because the mode of death had no special symptoms attaching t which pointed decidedly to the drug as a harmful agent; and under similar c cumstances, supposing that death was caused by the drug, it is quite possible th the ill result might be attributed wrongly to other causes. Death in such ca must, if ascribed to salicylic acid, be attributed to sudden collapse and failure the heart's action, symptoms known to be produced by salicylic acid, and some such cases of sudden collapse have already been observed and recorded by others, though perhaps rather in association with a more sudden fall of temperature. Such cases have led to the recommendation of caution in the size of the dose of the drug in cases where there should be any sign of a failing heart, or towards the end of an attack. But in the case under consideration there was no such indication for caution. Moreover, caution was never overstepped; so that the result, if it be a result, could only be averted, if at all, by commencing with a very small se and gradually increasing it. Dr. Goodhart thought that, in dealing with a ug which so quickly and so completely saturates the system, which, in some es, and one could hardly foretell when, produces severe nervous symptoms, in hers sudden collapse, this is always the wiser plan to adopt, and in many cases e smaller doses seemed to him to be all that are required for the relief of pain.

Dr. **Buzzard** then read notes of a case characterized by symptoms of acute eumatism, which terminated fatally on the tenth day. The patient was a pre- usly healthy lady, aged forty-two, who got a chill coming out of the opera on y 26th, and four days afterwards was taken with shivering, "queerness" in r head, noises in her ears, and sleeplessness. When seen by Dr. Buzzard on g. 3d, in consultation with her own medical attendant, Mr. Airey, she lay in d complaining of these symptoms—of deafness in the right ear and imperfect ing in the left, with constant nausea and aversion from food. The pulse had n at times as low as 56, and there was much prostration. The temperature normal, there was no paralysis, diplopia, or change in the fundus oculi; the t-sounds and breathing were normal. She had never had otorrhœa, and the fness had only been coincident with her illness. Restorative food and reme- s were prescribed. On Aug. 5th a great change had taken place. The tem- ature was 103° F.; pulse 106; face flushed; left knee-joint swollen, very ful and powerless. There had been much sweating. Urine acid. Heart- nds normal. She was ordered fifteen grains of salicylate of soda every three rs. On Aug. 7th, Dr. Buzzard found the temperature 99°, the pulse 108, respiration 38, the heart-sounds normal; the state of the lungs behind could t be ascertained. The swelling of the left knee was considerably reduced, but e right knee was now greatly swollen and painful, and also one of the finger- ts. Careful inquiry and examination failed to discover any wound or sore. re was great prostration. Brandy in frequent doses was prescribed, and the ylate ordered to be given at longer intervals. The patient sank next day. Buzzard remarked that he saw the patient upon three occasions. On the the symptoms were entirely cerebral in character; on the second, although y pointed strongly in the direction of acute rheumatism, yet he could not help ong feeling that the case was one of pyæmia, the cause of which, however, d not be ascertained. No doubt pyæmia did occasionally occur without any overable wound; he had known it happen in connection with a simple frac- e, and in another case from an ulcer of intestine, found after death. In the sent case all efforts to procure an autopsy were fruitless. He had not the htest belief that the salicylate had been of injurious influence, as the patient's dition from the first was exceedingly grave. Not more than twelve doses re taken.

Dr. **Bristowe** called to mind two cases of sudden death in acute rheumatism. ne was a case of a previously healthy young woman, who died in syncope, ithout any explanation; and post-mortem examination showed nothing beyond e articular inflammation. This was long before salicylic acid came into vogue. he other case occurred two or three years ago, and was also not treated by this rug. The subject was a young woman, with no very marked symptoms, freely sweating, a high but not excessive temperature. She died suddenly at the en of a few days. There was a trace of pericarditis found, and also some parti fatty degeneration of the myocardium, which did not, however, show any obvio inflammatory change. The case related by Dr. Buzzard was probably one o pyæmia. Quite recently, at St. Thomas's Hospital, he (Dr. Bristowe) saw a girl thought to be suffering from acute rheumatism, with a hot skin; but she had ha rigors; complained of pain in the course of the humerus. She was transferre to the care of a surgical colleague, who, suspecting some acute necrosis, excise the shoulder-joint, when his surmise was found to be correct. The case ende fatally, and, after death, pus was also found in the elbow-joint. There was su purative (pyæmic) pericarditis, and the lungs were studded with infarcts.

Mr. H. Lee could not admit that either of the cases read were acute rheuma tism. Surgeons were well acquainted with instances of septic poisoning simula ing this disease, and following even the slightest injuries. Some of these cas presented an eruption on the skin like scarlet fever. In Dr. Goodhart's case th febrile attack ensued upon the removal of a polypus, and the post-mortem ev dence favoured the view of the septic nature of the disease in the material alte ation found to exist in the blood and the ecchymoses under the pericardium.

Dr. Green could not feel sure that the cause of death in Dr. Goodhart's cas might not have been due to changes in the muscular tissue. One or two patche of fatty degeneration were found, and the contracted condition of the ventri could well be explained if rigor mortis had not passed off; for there is no do that rigor mortis might exist in very degenerate hearts, so that an organ grea diseased would yet appear fairly well contracted The sudden death poin strongly to its cause being due to changes in the muscular wall.

Dr. Glover did not think the case had much bearing upon the question of t toxic effect of salicylic acid, and it would not be right to draw any unfavoura inference upon this drug from an isolated case. He thought Dr. Bristowe's s gestion as to Dr. Buzzard's case to be probably the correct one.

Dr. Maclagan said there was no question as to Dr. Goodhart's case bei one of acute rheumatism, and he thought with Dr. Green that it would be wel more information had been afforded as to the state of the heart. As to the wh subject of the share taken in the ill result by salicylic acid, it must be remembe that it was now given very largely in many febrile and non-febrile diseases, b yet disastrous results were only recorded in connection with acute rheumatis Dr. Bristowe's remarks pointed to the fact that, quite apart from salicylic aci the rheumatic poison alone would in some cases lead to sudden death. Myoc ditis, too, was a more frequent complication of acute rheumatism than was ge rally thought. There was no doubt that inflammation extended from the pe cardium to the muscular substance; but such extension could not take place i endocarditis, which is always limited to the valves; and he thought that th inflammation might primarily involve the fibrous structures of the heart, as tho of other parts in acute rheumatism. Thus it might extend from the fibrous ring at the orifices to the muscular substance. Senator's views as to the conversion o salicin into salicylic acid in the blood involved an error. Dr. Maclagan mentione a case where the pulse increased in rapidity, and became weak under salicylate o soda, but improved when salicin was substituted for this.

Dr. Mahomed had seen Dr. Goodhart's case, which was undoubtedly one o acute rheumatism. He had been struck with the frequency with which the fir sound of the heart failed, and even disappeared, during convalescence after a pro longed course of salicylate of soda in acute rheumatism. He was much struc by this in a case of typhoid fever, where the salicylate was given; the pulse-rat rose from 120 to 160 within thirty-six hours, and so feeble was it that deat seemed impending. The drug was discontinued forthwith, and in twenty-four hours the pulse fell to 120, and the case subsequently improved. He had not the least doubt that, had the patient had one more dose of the salicylate, he would have died. He added that he had never observed so marked a degree of failure of the first cardiac sound in fever, as in these cases treated by the salicylate.

Dr. **Barlow** asked if the tympanic membrane had been examined in Dr. zzard's case. The first symptoms were shivering and pain in the ears, and he ggested that possibly the case was one of suppurative internal otitis (without pture of the membrane) giving rise to pyæmia. The fact that the effusion ssed away from one joint and appeared in another did not tell against pyæmia; r he had seen this occur in two or three cases.

Dr. **Dowse** had prescribed salicylate of soda largely, not only in rheumatism, t in other painful affections—*e. g.*, the pains of ataxy—always with relief to in, but sometimes with alarming symptoms of depression. But he had found t salicylic acid alone (which was quite as valuable in painful affections) did t have such depressing effects. He doubted if Dr. Goodhart's case was one of umatic fever; and he referred to a case with high temperature and profuse eating (not of an acid character), which, at first thought to be acute rheutism, turned out to be due to phlebitis.

Dr. Goodhart, in reply, said there was no question at all that his case *was* e rheumatism. The fact of the patient having had a nasal polypus removed ortly before the fever set in made him search carefully for any evidence of d-poisoning, and he still admitted the remote possibility of its being of such ture. But he submitted that it was just these obscure cases of septic poisonthat came under the cognizance of physicians rather than of surgeons, as Mr. e had said. In reply to Dr. Green, he said that the muscular substance of the t was carefully examined microscopically, but only with the result he had ed. Still, the heart might fail and its muscular structure not be diseased. e had looked through the literature of the subject as to the distinction between in, salicylic acid, and salicylate of soda, and confessed that it threw no light the matter. He agreed that, until cases of this kind were brought forward discussed, it would be impossible to draw conclusions as to the part played by cylic acid in the fatal result.

Dr. Buzzard, in reply, said that he was careful not to describe his case as one eumatic fever; but at the same time careful examination had failed to reveal source of pyæmia. Against Dr. Barlow's view was the fact that the deafwas at first complete in one ear, and then the other ear became slightly deaf. case showed rather cerebral exhaustion than acute inflammation. He did attribute the fatal issue in the least degree to the salicylate of soda.—*Lancet*, 17, 1880.

The Cause of Intermittent Fevers and the Nature of Malaria.

Professor **Klebs**, having gone to Rome last spring with the intention of intigating the cause of malarial fevers, with the assistance of a Professor of the man University, Dr. **Tommasi-Crudeli**, he was soon able, thanks to the idness of several Roman land-proprietors, to obtain the necessary material for se researches, from the soil and air of the infected districts, partly of Rome elf, partly of its environs, so ill-famed for fevers—that is, from the Roman mpagna and the Pontine Marshes.

From the introduction to their pamphlet we see that the two investigators llowed a very deliberate plan in the performance of their task. First, they rnish us with a very able description of the mode of propagation of the malarial fevers. This naturally forms the basis of their investigations into the cause the disease, the ideas about which have been so vague as to induce consta changes in the theories of its origin. A fresh theory takes the place of t previous one when recent facts and experience concerning the outbreak of t disease become known. If it be true that marshy districts are the favourite se of intermittent fevers, it is not the less true that there are no fresh cases to observed so long as a sufficiently high level of water separates the soil from t air. Further, it is no longer possible to consider malaria simply as a mar miasm; for it is not found in every marshy district, whilst, on the contrary, shows its existence in districts absolutely free from marshy ground—even whe the soil has never been constantly wet. It is also impossible to state a disti connection between the chemical and geological structure of the soil and t manifestation of malaria. Again, the accumulation of decaying organic mater in large quantities is not sufficient alone to explain an outbreak of intermitte fever. All these conditions, which, it is true, have their part in the manifes tion of the miasm, are to be considered only as adjuvant causes. It has be established beyond doubt, that in malarial districts three distinct factors necessary for the production of intermittent fevers—(1) high temperature of t air; (2) constant moisture of the soil; and (3) free access of air to the mo layers of the ground. Several pathologists have been induced by such facts deny altogether a specific cause of malaria. They numbered this disease amon those caused by cold, because, according to all experience, the last-named c dition takes a great part in the outbreak of the disease; but they complet forgot that in countries free from malaria, cold alone never causes intermitt fevers, and that, on the other hand, the malarial poison causes those fev without any previous cold. Others formed the idea that malaria might find origin in a parasitic organism, whose development must necessarily depend only on favourable external conditions, but on the existence of a specific ge Beyond the analogy of intermittent fever with other infectious diseases doubtedly of parasitic origin, such as relapsing fever and splenic fever, circumstance goes far to corroborate the parasitic theory—namely, the fact t malaria undergoes a very rapid increase, when the known favourable conditi for its development are no longer restrained by culture of the soil. Italy f nishes numerous illustrations of this point, because the malarial places h nowhere else been known with such exactitude from ancient down to rec dates; and because the difference between ancient and modern times as reg the prevalence of these diseases is far too great to be attributed simply to chemi and physical changes in the soil. Such an enormous increase is much m easily explained by assuming that a parasitic organism might have spread to s a large extent because the obstacles to its development had ceased to exist. T fact that the malarial poison is limited chiefly to the layer of air situated im diately above the surface of the soil, points to a corpuscular nature of the pois because such particles can spread farther only by motion of the air, whilst hypothetical gas would find no difficulty in diffusing itself through the upp layers of the atmosphere—even if we have no regard to the fact that no such g has ever been detected by chemical analysis.

During the last twenty years many efforts have been made to find a speci malarial fungus—with more or less success. Whilst a certain number of scienti charged some forms of algæ, found partly in the marshy water of malarial di tricts, partly in the marshy soil, with the production of malaria, but failed to gi real proofs for their assertions, others endeavoured by experiments on animals attain the solution of the problem. Griffini injected dogs and rabbits with de collected from rice- and marshy fields, and produced by such injections elevatio of the bodily temperature, but no distinct febrile attacks. Moreover, the spleen in those animals remained normal, and there was no augmentation of the organisms found in the dew to be observed in their blood. Similar injections made by Lanzi and Terrigi in the year 1870 gave no more distinct results, but in several of the animals which had perished after a smart attack of fever, the liver, the pleen, and also the blood of the portal vein, contained black pigment. Thus his method of investigation seemed not altogether quite unsuccessful. To tablish a substantial theory of a parasitic origin of malarial diseases it is cessary to prove (1) the constant existence of a definite species of organism in e malaria-soil as well as in the air situated above such a soil; (2) that this same ecies of organisms is alone sufficient, without the concurrence of any other ease-generator, to produce true intermittent fever. To obtain the latter proof is also indispensable to experiment on animals; and such an experiment would the more conclusive, the better we should succeed in isolating an *active* ganism from the marshy soil, and in introducing it in a suitable medium into e living animal. Further, it would be necessary to have the three following ditions realized, to enable us to recognize the disease produced in the animal the introduction of the organisms as true intermittent fever—namely, (1) the istence of distinctly intermittent feverish attacks; (2) the enlargement of the leen in the characteristic form—that is, a well-defined firmness of that organ, ch is distinguishable from the enlargement of the soft septic spleen; and (3) absence of a noteworthy diminution of the weight of the animal, at least ing the first feverish attacks. Concerning the first-named condition, it is true t, in the graver forms of malarial infection in men, the fever often enough es on a continued character, or has it from the beginning (*perniciosa*); so t in the animal also a continued fever would not perfectly exclude the existe of malarial infection. Another reason of some moment, tending to show t domestic animals generally are unfitted for experiments on malaria, seems be their oft-observed immunity from intermittent fevers in malarial districts. ll. this is not absolutely proved; and the authors assume, on somewhat pothetical grounds, that there might exist in the animals special protecting ditions against the infection with germs. But we shall soon see that the ples in that direction have been unfounded. Lastly, we have to note another portant kind of evidence for the malarial infection of animals; that is, the istence of the characteristic black pigment in the spleen, the liver, the marrow the bones, and the blood—a pigment which contains iron in inorganic comtion (recognizable by the blue colour after treatment with ferro-cyanide of sium and hydrochloric acid—a reaction which is not to be obtained with oglobin). From the existence of iron in that form it follows that during and in the interior of the otherwise unaltered blood-corpuscles, the hæmobin becomes decomposed and its iron set free by the influence of the malarial son.

When the authors had been so far successful as to produce by injections of tery extracts from the marshy soil functional disorders and anatomical lesions animals, which were completely in accordance with those following the natural fection with malaria, the task next to be undertaken was the isolation from the ude material of the active substance—that is, the true generator of the disease. that germ belonged to a plant, it would be possible to isolate it from the ccompanying organisms by cultivating it from the crude material in a medium itable for its further development; for then the other organisms will gradually sappear. This method of fractional culture (*fractionirte Cultur*), applied ccessfully by Professor Klebs in other instances, gave the desired result in this case also. Lastly, it would be necessary to apply filtration for isolating the organisms absolutely. By injecting the liquid containing the organisms, and by comparing the results afforded by that injection with those following injection with the filtered liquid, it can be proved that the special organism alone is efficacious, whilst the second injection has no effect.

Besides those organisms which were taken from the marshy soil, the authors also cultivated germs in a special way, which they had collected from the air above the soil. At some places specially exposed to the malaria a large quantity of air taken from a very small distance above the ground was sucked through a ventilator of special construction, which permitted the collection of all corpuscular elements contained in the air on a comparatively small space—that is, on a small glass plate covered with a mixture of glycerine and isinglass. Examination with the microscope showed, amongst those particles of dust, rods in very small number and filiform elements of some length. When those elements were transmitted into fresh urine, free from germs, an abundant development of bacilli was shortly to be seen, which showed the same characters as those cultivated from the soil. It was possible, after repeating the breeding process several times in different mediums at a definite temperature, to obtain a development of schizomycetæ which showed constantly the same characteristics, whether the germs had been taken from the soil, the marshy water, or the air. These fungi appeared as small rods of 0.002 to 0.007 millimetres in length, growing into long twisted threads, which after some time became furnished with joints at the surface of the liquid exposed to the air, or formed the so-called enduring germs (*Dauersporen*) in their interior. Besides the characteristic form of the fungus, it is distinguished from other bacteria by its relations to the air. It is markedly aërobiotic. If air has no free access, or is excluded, it will not grow at all, or dies out. Inasmuch as the development of the fungi was so constant, it was probable that this organism was the true *bacilus malariæ*. The next problem that arose was to test its nature by injecting it into the living animal.

Before the experiments on the animals could be begun, it was necessary to determine exactly the dimensions of the spleen as well as the average normal temperature. This done, the experimenters were able to define more exactly the pathological conditions of the injected animals.

In the first group of experiments two rabbits were injected with organisms collected from the slime and the air of the Pontine Marshes. Every one of them showed intermittent fever after one injection. When they were killed they presented very marked enlargement of the spleen, which contained large masses of dark brown pigment. The spleen and the lymphatic glands contained very small, bright corpuscles, which developed, after twenty-four hours in a suitable medium, into threads filled with spores. Formation of pus or any other changes due to inflammatory or septic processes of the different organs were entirely absent.

In further experiments, cultivated bacilli taken from urine, or the isinglass mixture, furnished the material for the injections, and always with the same positive results. The soil, taken from different places in Rome itself and the Agro Romano, proved, in nearly every instance, efficacious also. But the injection with water standing over the marshy ground remained without effect.

Of course it was necessary also to try soil free from malaria. Professor Klebs took infusions of the soil of the garden in the pathological laboratory at Prague. The results remained in this case somewhat doubtful, because the animals became ill, but not in the same way as before, so that it seemed that a mere septic injection had taken place. Two rabbits became ill and died with symptoms of septic poisoning spontaneously at Rome, so that it was possible to compare the two processes directly; and the pathological conditions found in the dead bodies proved different in these latter cases, because pus was found, pigment was totally absent, and the spleen, although enlarged, had lost its firmness.

Afterwards Dr. Marchiafava at Rome was able to demonstrate spores and bacilli in the spleen, the marrow, and the blood of three persons who had died of pernicious fever, showing the same characters as those observed by Klebs and Tommasi-Crudeli.

In summarizing the results of their investigations, the authors consider the llowing facts as proved: (1) That it is possible to reproduce malarial infection every form in rabbits in which it is known in men; (2) that the malaria proced artificially in animals is generated by organisms existing in the malarial at the time when the outbreak of the fever has not yet taken place. We see, refore, that those experiments, although small in number, have led to very portant results. It is to be hoped that they may become the starting-point for ther investigations in the same direction. As the authors themselves allow, e are still many points which require further elucidation. But it is encourag- to see how, by a comparatively small number of careful experiments, good lts can be arrived at, when a strictly logical and methodical course of investiion has been pursued.—*Med. Times and Gazette*, Jan. 17, 1880, from chiv *für Experimentelle Pathologie und Pharm.*, Bd. xi.

On the Pathology of the Central Nervous System.

Kahler and A. Pick publish a series of contributions to the pathology pathological anatomy of the central nervous system in the *Prager Viertel-schrift*, new series, 1879, pp. 1 and 2. The first is a contribution to the lization of functions in the brain. According to Wernicke, the central end the auditory nerve and, with special reference to aphasia, the centre of fortion of sounds, are to be placed in the first temporal convolution; and lesion the same must be considered the fundamental cause of deafness for words smaul). The authors communicate the following case in evidence. A man, 42 years of age, suffering from aphasia, who could utter but very few lligible sounds, but who presented no signs of paralysis in the extremities, ld hear, without understanding what was said to her. She had to be guided the simplest offices by the nurse, as oral directions were unintelligible to her. making a *post-mortem* examination, the convolution of the left temporal lobe eared soft and gelatinous, as did the posterior half of the third frontal convo- n. The right temporal lobe was also softened to a smaller extent. A second was that of a drunkard, aged 37, who was paralyzed on the right side, ic, and deaf to words, though he heard plainly. A hemorrhagic pachygitis, chiefly on the left side, had compressed the whole brain, especially middle and third frontal convolution, almost the whole temporal lobe, and lateral portions of the parietal and occipital lobes. As to those cases re- ded in which, in spite of affection of the temporal lobes being shown after- ds, no trace of word-deafness was observed, there was (according to the hors) in every case a sufficient lapse of time for the recovery of the possibly power of understanding words. In connection with this, the authors men- , with regard to the first case (in which during life no lesion of the nutrition of the motor power of the extremities was shown), the actual presence of a elitic focus in the spinal cord in the left anterior cornu of the lumbar region, which, besides the local changes, asymmetry of the whole cord was produced. s shows the necessity of care in investigating such cases of asymmetry, and of omitting to make a thorough search for the presence of some myelitic focus, wever small, in the spinal cord.

In the second section, an interesting case of word-deafness (*Wortaubheit*) is communicated; that of a man, aged 55, who was suffering from atactic aphasia, word-deafness, agraphia, partial ataxy, slight loss of power in the joints, and loss of musical memory.

The third section treats of the localization of motor-phenomena after hemiplegia. The authors observed in a man, aged 60, about six months after an apoplectic attack, which caused paralysis and complete anæsthesia of the right half of the body (including the sense-organ), purposeless movements of the finger and hand on the paralyzed right side. Later on, twitchings and violent swinging of the right arm and uncontrolled movements of the toes set in. These movements ceased during sleep, but the hand always assumed a peculiar position (super-extension and abduction of single fingers). At the posterior end of the left corpus striatum, an opening led into an apoplectic cyst as large as a farthing. The same was found in the external part of the optic thalamus, and it sent a prolongation outwards through the inner capsule. On vertical section through the middle of the thalamus, the apoplectic cicatrix was seen in the outer half of the thalamus, and extended as a reddish-brown colouration through the whole breadth of the inner capsule to the nucleus lenticularis. This place lay immediately behind and bounding that which, according to Flechsig, contains the compact bundle of the fibres of the pyramids. A partial secondary degeneration was found in the right lateral column of the cord. The authors consider the lesion of the compact bundle of the fibres of the pyramids, which ascends between the optic thalamus and the posterior part of the nucleus lenticularis, to have been the cause of the pathological appearances; but that it is also possible that lesions of the fibres of the pyramids in other places (as the inner part of the capsule) may be followed by the same, or similar results.

The fourth section is on ataxy, and ataxy after acute diseases. A case of cerebral ataxy is interesting, showing that circumscribed disease of the motor tracts of the cortical substance of the brain may cause crossed ataxy. It was that of a woman suffering from tuberculosis, who first experienced a feeling in the right hand and arm as if ants were running over it; and soon after this a difficulty in using the limb. Though the sensibility of the skin was unimpaired, all sense of the position of the limb in space was lost. Later on, headache, aphasia, and paralysis of the right side set in. After death, along with tubercular meningitis of the base, a flat cheesy tumour was found in the posterior part of the left frontal lobe, and a second smaller one on the parietal lobe. Similar results have been described by Bernhardt, Gelpke, Fritsch, Hitzig, and Nothnagel, in their experiments upon excision of the cortical substance of the brain; and recently by Munk. As the authors (like Friedrich) believe that the destruction of co-ordination of movement is to be referred to lesions of the cortical substance of the cerebrum, cerebellum, medulla oblongata, or spinal cord, there remains a series of cases of ataxy, which until now have wanted any distinct anatomical proof of the place of the lesion in the cerebro-spinal system. These are the cases of acute or functional ataxy after acute illness. The authors group the recorded cases and some new ones under three heads: 1. Cases with more or less rapid recovery; 2. Cases ending in chronic incurable disease; 3. Cases rapidly leading to death. To the first group belong cases of acute ataxy after intermittent fever (communicated by the authors), pneumonia, erysipelas of the face, scarlatina, measles, typhus, and diphtheria. Most probably, in all these cases, there is a wide-spread pathological process independent of the nerves, which can only, in a few cases, be more accurately localized, as by absence of the patellar tendon-reflex in the lumbar cord, by aphasic conditions in certain regions of the cerebrum, etc. To the second group belong especially the cases following varioloid and typhus, described by Westphal and Otto (*Centralblatt für die Med. Wiss.*), and a case likewise after typhus, observed by Kahler, and the important case described by Ebstein (*ibid.*, 1872, p. 367). There proof was given that, after abdominal typhus, an illness may arise, causing after several years small sclerotic foci in the edulla oblongata and medulla spinalis. In the third group, that of cases with tal results (Leyden, Jolly, Oertel), the condition was that of extensive acute yelitis, from which, as Leyden showed, sclerosis may arise (*Centralblatt für e Med. Wiss.*, 1878, p. 676). In cases of the first group, with quick recovery, e authors assume that there has been an acute illness caused by the migration f fungi, which, in consequence of the diminished resisting power of the organ cked, that is to say, in conditions favourable to the development of the fungi, y lead to myelitis and sclerosis.—*London Med. Record*, Feb. 15, 1880.

Cases Illustrating the Connection between Phthisis and Brain Disease.

Two cases of lung disease, with secondary brain complication and paralysis, blished early this year by Professor SENATOR, of Berlin ("Zur Diagnostik Hirnerkrankungen"—*Berliner Klin. Wochenschrift*, Nos. 4, 5, 6, 1879), to which our attention has recently been directed, are of so interesting and ual a character that an abstract of them cannot but be acceptable to our ders even now. Later on in this article we shall bring forward some other belonging to the same category, but more interesting from the light they on cerebral localization than from their etiology.

he first case which Professor Senator describes is that of a man, aged thirty, itted under his care on July 31, 1878, with dulness of the upper lobe of the t lung, bronchial breathing, not very abundant bubbling râles of medium e, cough, and rather scanty expectoration of a somewhat putrid character. h the exception of some fever in the afternoon, and occasional diarrhœa, his eral health was as yet but little impaired, and he did not at any rate require eep his bed. The aspect of affairs soon altered. On the 4th of August he noticed that his right hand was weak, and that he dropped his spoon at ls. On August 5 it was found that all the fingers of this hand were partially alyzed, and could be neither flexed nor extended properly. There was no ation of the sensibility of the skin, but the whole right hand and forearm e warmer than the left, and perspired freely. The next day voluntary movets of the hand were quite abolished, and the forearm seemed somewhat atous in comparison with the left.

he forearm muscles proper became paralyzed on the 7th of August; on the the patient had an epileptiform fit with loss of consciousness, and beginning twitchings in the right arm. These fits recurred on the two following days different degrees of intensity, the right side of the body being alone convulsed, scarcely impaired consciousness in one of them. On August 11 the muscles plied by the lower branches of the facial nerve were paralyzed; in the next days the power of voluntary movement of the right leg was lost. Sensation ywhere remained intact, but the patient gave an inaccurate account of the ition of his limbs. On August 14 symptoms of aphasia appeared, and on gust 16 he only answered "yes" or "no" to questions, and that not always herently. From this time he gradually became apathetic, and then comatose, d died on August 19. The electrical irritability of the arms was found the day fore death to be the same on the two sides, but the circumference of the right n on measurement was about half a centimetre less than that of the left; hereas on August 7 the latter was a centimetre the smaller. The ophthalmoope gave no clue to the nature of the brain disease. The pulse was not retarded and ranged between 92 and 112. The highest evening temperature wa 39.4° C. on August 13; the highest morning 39.3° on August 14.

A cavity was detected at the right apex some days before the patient's deat We pass over the details of the post-mortem examination of the phthisical lun to give a brief note of the state of the brain. In the left hemisphere an absce was found, containing about fifty grammes of foul pus, and extending from cl under the pia mater to about half a centimetre from the roof of the lateral ve tricle. The corpus striatum and optic thalamus were intact. The exact positi occupied by the abscess, as far as could be made out, was the region of th ascending frontal convolution,[1] and especially where it borders the fissure Rolando, and a small part of the neighbouring first and third frontal convol tions. The ascending parietal convolution was slightly discoloured and flatten on the side towards the fissure of Rolando, but otherwise scarcely affected the abscess.

There was no sign of any old or recent injury to the skull. Except a coup of spoonfuls of serum in the ventricles, the rest of the brain—pons, crura ce bri, and medulla oblongata—were healthy, as well as the bloodvessels at base.

The diagnosis of the disease was doubtful during life. It lay between cyst cercus (the patient having once suffered from tapeworm), tubercle, and absce The post-mortem showed that the first two contingencies were inadmissible. Th absence of a rigor, Senator specially observes, must not be taken as negativ the existence of abscess.

The great interest of this case arises, first, from the connection between abscess and the ulceration of the lung; and secondly, from the nervous sym toms produced by the peculiar situation of the abscess. The possible depe ence of cerebral abscess on lung disease, first pointed out in 1858 by Sir Gull, has since been insisted on by Biermer, R. Meyer, and Huguenin; from 1867, when Meyer collected and published eighty-nine cases of all form this affection, eleven of which were complicated with suppuration in the lu until the end of 1878, only ten cases had appeared in the English and fore medical journals in which the reporters had mentioned the existence of pul nary disease, and in several of these they only spoke of it casually, as if it co have no possible bearing on the production of the abscesses. Senator gives ref ences to twenty-six cases of abscess of the brain, published between 1867 a 1868, in which are included the ten above referred to, the remaining sixt being described by the writers as "idiopathie." This fact alone shows how i portant it is that the attention of the profession should be directed to the re tion of pulmonary disease to cerebral abscess. The physiological researches Hitzig, Ferrier, and others, have left little doubt that part of the cortex of brain has motor functions, and the results of pathological observation every d add confirmation to this view. Having recently spoken of this cortical cent in reviewing Dr. Decaisne's work "Des Paralyses Corticales du Membre Sup ieur" (*Medical Times and Gazette*, November 1, 1879, page 511), we need little further with regard to cerebral localization in Dr. Senator's case than th the absence of lesion of the left ascending parietal convolution, with comple paralysis of the right upper and lower extremities, is noteworthy. Certain peculiarities in the symptoms observed in this case deserve careful attention—(1) The patient had disturbance of the muscular sense, so that he was unconscious of passive movements or changes of position in his right arm and leg. The same thing has been observed by Hitzig, Nothnagel, and Munk, after extirpation of the corresponding region of the brain in animals. The only other published ase where this symptom was observed, and which was verified by an autopsy, , as far as Senator knows, that of Gelpke (*Archiv der Heilkunde*, 1876, S. 8). (2) His right arm was warmer than the left; it perspired more vigor- sly, and for one or two days was slightly œdematous, while its circumference minished to a measurable degree during the short time the patient was in hos- ital. Senator believes that his is the only known case in which *cortical* disease the brain and sweating on the paralyzed side have been noted together. In ease of the large ganglia, from hemorrhage, etc., sweating is, of course, by means so very uncommon. The experimental results of Bochefontaine, Hit- , and others, who found that extirpation or irritation of certain parts of the tor region of the cortex were followed by a rise of temperature in the oppo- limb, are thus strengthened, if not confirmed, as are also those of Luch- ger, Nawrocki, and Adamkiewicz (*Medical Times and Gazette*, October 25, 9, page 486), with reference to a cerebral centre of the sweat function. The rent rapid atrophy of the muscles of the right arm and forearm in the last days of the patient's life, Professor Senator regards as due to a possible ry of the "giant" nerve cells discovered by Betz in the motor region of the n (*Medical Times and Gazette*, vol. ii., 1874, page 498), and which may haps have trophic functions analogous to those of the large cells in the anterior na of the spinal cord; but this is a question which cannot be settled without ch further investigation. It is nearly certain, however, that the atrophy can- be accounted for in this case by disease of the particular muscles, for, though lyzed to the will, they were repeatedly violently contracted during the epi- iform seizures. With reference to these seizures, the fact that at first they d be abated by drinking salt and water, or by tying a band round the arm in ch the twitchings began, is interesting, though of course frequently observed e epilepsy, and of late in cortical disease (Charcot and Pitres, and others). nator's second case may be dismissed much more briefly than the first. n, we have paralysis beginning in the right hand, extending to the lower ches of the facial nerve, then to the whole arm, and lastly to the right leg, man of twenty-nine, with phthisis and cavities in the left lung, the patient within eight days of the first onset of nervous symptoms. As in the first , general sensibility was unaffected, but no convulsions occurred, and there no aphasia. The bladder and rectum were not paralyzed in either case. In second, consciousness was preserved to the last. The post-mortem examina- differed very materially, however, in the two cases, for in the second *no lized disease could be detected anywhere in the brain.* The most careful ch revealed nothing but considerable dilatation of the bloodvessels of the tance of both hemispheres—if anything, more left than right,—general injec- of the pia mater, and fulness of the large veins. Professor Senator calls ention to the onset of lobar caseous pneumonia with marked cyanosis in the fortnight of his patient's life as possibly explaining the cerebral symptoms. uming coincident, but unevenly distributed, cerebral hyperæmia, it is not ikely "that the motor centres, or tracts in the left hemisphere, were specially pressed, although no anatomical proof of this could be discovered." Cases the above are, as Senator observes, very scantily represented in medical erature. Graves and Andral have referred to one or two of doubtful resemblance to it, but the nearest approach to it is one by Romberg and Henoc ("Clinische Beobachtungen;" Berlin, 1851, S. 45). Since Professor Senat published his paper, three other German physicians have recorded cases phthisis with brain symptoms and paralysis,—Dr. Goltdammer ("Kasinstisch Mitheilungen zur Pathologie der Grosshirnrinde"—*Berl. Klin. Wochenschrif* Nos. 24, 25, 1879), Professor Drasche, of Vienna ("Ein Fall corticaler Ep lepsie"—*Wiener Med. Wochenschrift*, No. 39, 1879), and Dr. Bernhardt, Berlin ("Klinische Beiträge," etc.—*Archiv für Psychiatrie*, Bd. iv., S. 698) the reference to whose paper we owe to Professor Drasche. Their cases, how ever, have no bearing on the connection of phthisis and abscess of the brain, f the lesions met with in the brain were tubercular. They interest us main because of their bearing on the subject of cerebral localization and the mot centre. Dr. Goltdammer's patient, a man of forty-two, with advanced phthis was seized ten days before death with headache, followed by epileptiform co vulsions involving the left arm and left facial muscles, with loss of consciousne Soon afterwards the left arm and the parts supplied by the buccal and ocul branches of the facial nerve became paralyzed. The paralysis here never tended to the left leg, and the patient quickly died with high fever and com The right ascending frontal and parietal convolutions were found flattened, pa and broader than normal, with the pia mater over them thickened and the of miliary tubercles. The gray substance of the median portion of these con lutions was softened at three spots, each about the size of a pea, and a deep tion revealed a nodule of hemorrhagic softening as large as a walnut near middle of the fissure of Rolando. The softening was probably the result obliteration of vessels, partly by tubercles in their adventitia, and partly by compression of the thickened pia mater. The rest of the brain was healt Professor Drasche's case only differs from the last in the leg as well as the and face becoming paralyzed. Here also there was loss of consciousness. patient was again a male, aged twenty-four. The pia mater covering the asc ing convolutions was found studded with caseous tubercular nodules, and th were gray miliary tubercles in the Sylvian fissure. The gray substance of particular convolutions was softened. We have not been able as yet to read details of Dr. Bernhardt's case, but it is nearly identical, according to Profe Drasche, with his and Dr. Goltdammer's. It will be clear, even from the me description we have given of these latter, that they by no means rival Senat two cases in physiological or pathological interest. The termination of pht in tubercular meningitis is no rarity; it is only the special localization of tuberculosis and its products which arrests our attention here. Senator's ca stand out from the rest, especially his first, by the association of a rise of te perature with sweating in the paralyzed arm, and by the curious affection of muscular sense and possibly of the trophic nerves of the limb. It is these li differences between the symptoms which mark a series of roughly similar ca that should make us pause and think whether the cortex of the brain is not ev more complicated than many persons at present imagine. It seems not unlik that in one and the same convolution there may be a series of ganglionic cent each controlling a separate function, just as we have long known of the existe of such ganglia or "nuclei" in the floor of the fourth ventricle. It is bett however, to accumulate facts than to speculate prematurely.—*Med. Times* *Gazette*, Jan. 17, 1880.

---

[1] Professor Senator speaks, in first describing the relations of the abscess, of "second frontal convolution" (*zweite Stirnwindung*) as the most involved (*loc. c* page 43), but it is clear, not only from what we know of the "motor centre" of cortex, and also from his own after-statement (*loc. cit.*, page 61), that "the mot disturbances must be explained by the disease of the ascending frontal convolut (*vorderen Centralwindung*)," that he was in error in speaking of the second front convolution.

Inhalation of Benzoate of Soda in the Treatment of Phthisis.

Great interest has been excited in Germany by alleged cures of phthisis by inhalation of pulverized solutions of benzoate of soda. So great, indeed, was excitement produced by the first published account of the cures effected in quite desperate cases, by Professor Rokitansky of Innsbruck and his assistant, that the political journals rang with the reports of this marvellous discovery, society was greatly stirred by it, and the echoes of it have been noticed in paragraphs current our newspapers; various queries have also been addressed to us on the subject. We have thought it well to wait until the test of further clinical experience has een applied. This has now been done, with, unfortunately, decisive negative sults, especially by Dr. Guttmann of Berlin.

The history of the matter begins with a communication, made by Professor ebs, at a scientific meeting in Munich, in June, 1877, when he announced the inion, founded on experimental and microscopical observations, that tubercuis was an infectious disease of parasitic nature; that it was induced by certain cro-organisms which invaded the body and multiplied in it; and that the extation might be entertained of curing it by the employment of means which calculated to annihilate these organisms. The experimental proof of the asitic character of tuberculosis was conducted by Klebs in this wise. If the allest piece of tubercular matter—for example, a fragment so minute that it hardly be seen by the naked eye—be put into a vessel with a suitable nutrifluid, such as a solution of white of egg, the solution, after a short time, omes turbid, from the development in the fluid of a great number of micronisms, which show lively movements. In a control experiment, in which ame solution of white of egg is put into a similar vessel, but without the tion of tuberculous substance, the solution remains quite clear. Cultivation ccessive solutions of white of egg, to which only a drop of the first tested tion is added, leads to the infection of each in turn, if a drop of the first be ed to a second, a drop of the second to a third, and so on. Further interest ches to this theory on the origin of tubercle, in consequence of the recently lished researches of Dr. Schüller of Griefswald. These researches show that als, into which tuberculous masses have been inoculated by tracheotomy, or have been injected with micro-organisms obtained by fractional culture, ording to the method of Klebs, died without exception with very marked nomena of emaciation, loss of heat, and, after a little time, general miliary rculosis. When, however, the same animals, after infection with an equal ntity of tuberculous substances, and the bacteria obtained from them, and the appearance of the characteristic phenomena of disease, as in the prely mentioned animals, were subjected to the inhalation of a pulverized soluof benzoate of soda for some weeks, they all survived. Their body-weight lly recovered itself; growth of hair became stronger; and, after a short time, nimals showed again their normal conditions. In passing, it may be mend also that Dr. Graham Brown had found, in the course of researches in the atory of Klebs, that when the fungi of diphtheritic membranes were treated a solution of benzoate of soda, or when animals were injected with these i which had been saturated with a solution of benzoate of soda to the extent a thousandth part of their body-weight, the diphtheritic fungi did not grow, became inactive.

On the basis of these results of research, a five per cent. watery solution of zoate of soda was employed, in the hospital at Innsbruck, by pulverization, an inhalation in cases of phthisis. In a communication of Dr. Kroczak, stant to Dr. Rokitansky, to the *Wiener Medizinische Presse*, September 14, 79, favourable results were announced which had been obtained in fifteen tients so treated, "the results exceeding all expectations." The three most ere of these cases were described in detail. Two showed "generally diffused al phthisis, with the formation of caverns." The third, also a case of extensive phthisical disease, was complicated with well-marked pleural exudations. These three were only put forward as examples of cases treated, and were, a was stated in so many words, "persons, so to say, moribund upon entrance to th hospital, and who were sent out cured." All these patients were already fre from fever at the end of a week; the third after ten days; and the weight of th body also very quickly increased. It is not stated how long the treatment b inhalation was carried on; but it could scarcely have been longer than thre weeks, according to the dates given at which the patients entered the hospita and left it cured.

Dr. Guttmann, in a communication which he made to the Berlin Medic Society in November, and which was recently published in the *Berliner Klinische Wochenschrift*, in recalling these preliminary facts, observes also th Professor Schnitzler of Vienna had arrived lately, from a series of experimen (*Wiener Medizinische Presse*, 1879, No. 42), at the conclusion that no medicament enters the bronchi by the inhalation of pulverized medicated solution Guttmann, however, points out that these conclusions are a little too absolut inasmuch as well-known pathological observations show that, after continuo exposure to an atmosphere loaded with particles of coal or iron, or other colour substances, the lungs are found after death to be impregnated with such materials. While it seems clear that the greater part of the substances pulverized f medicated solutions are deposited on the tongue, pharynx, soft palate, and epiglottis, it seems nevertheless, beyond doubt, that small particles pass the rima the glottis, and to a small extent enter the trachea, and possibly pass into bronchi. Of course, such results are obtained much more completely when patient can be retained permanently in the inhalation-chamber. Dr. Guttman treatment extended over thirty-one phthisical patients, of whom twenty-f were men and seven were women, from seventeen to fifty-six years of age. T phthisis was in the majority of the cases very extensive, often having proceed to the formation of considerable cavities; in a smaller number of cases, the d ease was relatively lighter—cases which were at times either altogether free fr fever, or which were running their course with only slight fever. Those patie were purposely chosen for this observation whose temperature showed a w marked hectic type, that is to say, low morning temperatures, high even temperatures, and moreover who, during the latest part of their stay in the h pital, had shown a certain steadiness in their temperature-curves. Any influe of the treatment by inhalation could, therefore, be very easily observed in t temperature-curves of such patients. The temperature was taken three time day at the same periods—morning, midday, and evening. The inhalations to place twice daily—morning and evening. The solution of benzoate of soda w a five per cent. solution in water. At first, Dr. Guttmann prescribed only fi *grammes* of benzoate of soda daily, that is to say, the inhalation of one hund *grammes* of solution; later, he rose, in the case of five patients, to ten *gram* of the substance, that is to say, two hundred *grammes* of the inhaled solutio day. When Rokitansky's communication appeared, in which he intimated t his patients had daily inhaled the one-thousandth part of their body-weight benzoate of soda in substance, that is to say, fifty *grammes* of benzoate of so in substance per fifty *kilogrammes* of body-weight, and therefore a thous *grammes* of the solution, then Dr. Guttmann also raised the prescriptions of patients to these large quantities. Of the thirty-one patients, fifteen inha during three weeks; one for two days (the latter had during this time consum seven hundred and ten *grammes* of benzoate of soda in substance); six patie inhaled during from fourteen to nineteen days. Of these, one took six hundr and fifty *grammes* of benzoate of soda in substance. The remaining nine patie inhaled during from three to twelve days. In four of these who did not tolerate inhalation, the benzoate of soda was given internally, in the quantity of from twenty *grammes* of benzoate of soda to two hundred of water (one tablespoonful every two hours). Of these thirty-one patients, nine died—seven men and two women; two were allowed at their own wish to leave the hospital; and the rest were still there. The result obtained was as follows: In not one case—not even, therefore, in the patients who inhaled daily a thousand *grammes* of the solution —was the temperature in any observable manner lowered by the benzoate of soda, or was any influence exercised on the temperature-curves. Dr. Guttmann adds hat the internal use of the benzoate of soda, during a considerable time in which a daily quantity of about eight *grammes* in substance was taken, was equally ithout influence on the febrile temperature. On the second notable factor in e progress of phthisical patients, improvement or falling off in weight, the eatment with benzoate of soda was equally without influence. In most cases, e weight of the body fell off progressively, in proportion to the amount of rexia and exactly in the same manner as though the patients had not been dergoing treatment during this time. Only in one or two patients, in whom e fever was throughout and from the first slight, did the body-weight remain tionary or slightly increased. Neither did the local symptoms of the phthisis dergo any change during the course of the treatment, in the sense of improve- ent. Dr. Guttmann observed, indeed, that the catarrh and bleeding diminished rtly after the inhalations; that is to say, that the patients coughed and expec- ted less for about an hour after the inhalations were over. This, however, attributes to the fact that the inhalation, and the continuous deep inspiration uired while it was going on, excited during the time a much more considerable ount of coughing by irritation; and thus, during the period of inhalation, a ch more considerable amount of expectoration was induced—thus clearing the ities and tubes, and giving rise to less expectoration for a short time after the alations had ceased. There was no permanent improvement either of cough of expectoration after the inhalations, nor were the nocturnal sweats, when se were present, at all lessened by the benzoate of soda. While in not one e was any symptom of phthisis observed to be improved by inhalation; on the er hand, an occasionally unpleasant incidental action of the benzoate of soda s observed. A good many patients complained of nausea and some of vomiting; ptoms which, partly at least, were excited by the continuous stretching for- d of the tongue during the inhalation, on which Rokitansky lays considerable s, in order that the inhaled substance might reach the air-passages. It ap- ed to be partly due to the fact that the benzoate of soda acts as an excitant the mucous membrane of the stomach, in so far as it reaches it by the inhala- s through the œsophagus, and so onwards. Guttmann has observed in one e, on *post-mortem* examination of a phthisical patient who had inhaled ben- te of soda quite up to the end of his life, a recent and general capillary gestion of the mucous membrane of the stomach. In the *post-mortem* exam- tion of nine phthisical patients, who had inhaled benzoate of soda, nothing s found in the pathological condition of the lungs which in any way indicated e commencement of a healing process. There was generally an extensive thisical change, with cavities filled with fluid pus. In one case of left-sided eumothorax, there was a perforated cavern. Two phthisical patients, who d for several years shown no symptoms of hæmoptysis, were attacked freely th hæmoptysis after inhalations. These researches, therefore, carried on ring the same period, in the same manner as those which were published from okitansky's clinique, are in absolute and complete opposition to them.

Dr. Wenzel reports also ten cases of phthisis, treated at the Charité Wards at

Berlin, under Professor Waldenburg, with benzoate of soda inhalations, under similar conditions to those of Dr. Guttmann. He also reports, as the result of treatment, that neither in the more severe nor in the lighter cases was any direct effect produced on the phthisical process. There was not once even any symptomatic or palliative improvement. Four of them ended fatally during the three or four weeks in which the treatment was being carried on. There was no effect upon the febrile process, nor was the appetite improved. The inhalations for the most part were well tolerated, except that in two cases they produced slight nausea and vomiting; and many of the patients complained of the inconveniently long inhalations. On the whole, the results of the experiments in Dr. Waldenburg's wards were not at all more favourable than those of the other cases.

In the last number of the *Wiener Medizinische Wochenschrift*, Professor Drasche reports, from the General Hospital at Vienna, the results of his employment of benzoate of soda in twenty cases, and these results are equally disappointing. The effect of the benzoated inhalations appears to have been quite without palpable influence upon the well-being of the patients. Six out of the twenty died; three of them were on the point of death; six were neither better nor worse; and, altogether, the results were entirely hostile to those announced by Rokitansky and Kroczak. Moreover, Drasche observed one very significant case, in which, at the beginning of the benzoate treatment, the larynx was quite intact, but, under the continuous inhalations, reddening and swelling of the vocal cords commenced under his eyes, went on to hoarseness, infiltration, and, finally, ulceration on both sides, notwithstanding the continuous moistening of the larynx by this pulverized solution of the benzoate of soda. This fact is, he observes, a very significant comment on the theory, that physical ulcerations are due to the excessive development of the infective bacteria, which benzoate of soda is supposed to destroy. The whole question of the application of disinfectant inhalations to the lung is treated, in its historical relation, in Waldenburg's book, *Die locale Behandlung der Krankheiten der Athmungsorgane;* and it is, of course, one of the oldest and most obvious methods of treating lung disease. As to the physiological action of benzoate of soda, apart from its antimycotic power, for which it was recommended by Klebs and employed by Schüller and Rokitansky, in this instance it may be observed that Salkowski, who, in 1875, first called attention to the antiseptic action of benzoate of soda, points out now, in Virchow's *Archiv* (vol. 78, part 3), that the elimination of nitrogen appears to be considerably increased by it, and that an increase of the destruction of the albuminoids of the body is caused. The increased excretion of nitrogen extended to five *grammes* daily; and, in the course of a week, by a continuous use of high doses of benzoate of soda, a loss of one *kilogramme* of muscle would be caused. These exact researches put Rokitansky's observations of an increase of body-weight, in certain of his phthisical patients, in a special light; since it is clear that, if such increase occur, it must be rather as the consequence of the improved nutrition of the patients after being taken into hospital from poor homes, than of any arrest of the tubercular disease, which does not seem to be affected by the benzoate of soda, or of any direct action of benzoate on the body, for such action would evidently be in an opposite direction.—*British Med. Journal*, Jan. 3, 1880.

Cardiac Lesions in Chronic Interstitial Nephritis.

In a note presented to the Société Anatomique, and published in the current number of *Le Progrès Médical*, Drs. DEBOVE and LETULLE direct attention to the constant presence of fibroid overgrowth in the papillary muscles and wall of the hypertrophied left ventricle in chronic Bright's disease. They assert that such a condition has been hitherto overlooked by writers; but it is fair to state that it has not escaped observation, although the significance they give to it has, perhaps, not hitherto been dwelt on. Indeed, it may safely be said, as a matter of common post-mortem experience, that considerable muscular hypertrophy of the ventricle is associated with patches of limited fibroid change, and this wholly apart from any chronic valvular lesion. The present writers show, however, that the sclerosis takes place at the expense of the muscular elements, which appear shrivelled and wasted in the vicinity of the change, and they go so far as to attribute the final symptoms of chronic Bright's disease to this cardiac condition. Thus they say that the first period of interstitial nephritis—the renal period—is characterized by slight albuminuria, polyuria, and slight and transitory œdema. But in the second, or "cardiac stage," palpitation and dyspnœa supervene, with oliguria, considerable albuminuria, and increasing anasarca, with dropsical effusions. Whatever truth may exist in these suggestions, they are certainly open to the criticism that no notice is taken of the increased impairment of the renal function, with the altogether strange omission of any reference to uræmic poisoning as an element in the production of some of the symptoms. The note is too brief to admit of extended or minute criticism, and we are glad to see that the authors promise to continue their investigations, and to enter more fully into the subject in a memoir shortly to be published.—*Lancet*, Jan. 3, 1880.

Passage of a large Gall-stone per Anum.

At a late meeting of the Pathological Society of London, Dr. Ord showed a large gall-stone which had been passed per anum by a lady under the care of Dr. Carr Roberts. She had been recently confined of a living child, and the only symptoms at all referable to the calculus were excessive pain in the back, and constant diarrhœa of a pale-yellow colour; there was no jaundice. The stone, which was removed by the finger, measured 1⅝ inch in its long diameter, and ¾ inch across. It was composed of cholesterine and bile pigments, and was therefore clearly not an enterolith, which consists of hair, concreted indigestible matter, and triple phosphates, lime salts, eleagic or litho-fellinic acid, but never of cholesterine. Referring to the structure and composition of gall-stones, Dr. Ord pointed out that they consist chiefly of a mixture of cholesterine with biliary pigment, mucus, lime salts of biliary acids and carbonate of lime being occasionally present. On section, they are seen to consist of four parts: a dark central portion, consisting mainly of pigment, with a small quantity of cholesterine in rhomboidal forms; around this a lighter portion with a distinctly radiated structure, composed of columnar masses of colourless cholesterine, with biliary pigment packed between; surrounding this is a zone, with the laminæ arranged concentrically, and composed of undulating crystalline fibres of cholesterine stained with pigment, more deeply stained towards the surface; the outer surface of the calculus, which is also the most recently formed, is deeply coloured, without any definite structure, and is composed of an intimate mixture of cholesterine in shapeless masses, spheres, or fibres, with biliary pigment. These facts point to a gradual metamorphosis of the calculus, and Dr. Ord suggested that it was the presence of the colloidal pigment which prevented the freshly deposited cholesterine from assuming at once its proper crystalline form; but that, as the pigment tends to become itself crystalline, the two bodies gradually separate, and the cholesterine crystallizes. In support of this hypothesis, it was alleged that in the most deeply pigmented calculi the outer layer is abundant, while in the paler ones the crystalline centre predominates. Dr. Ord related some experiments in which he found that cholesterine deposited in albumen or gelatine is at first spherical, and gradually assumes a quasi-crystalline form; and that mixtures of cholesterine and bile pigments, dissolved in hot acetic acid, form, on cooling, homogeneous spheres, which gradually break up into smaller spheres, and then again into needles, which arrange themselves in a mixed laminar and crystalline structure around the centre of each sphere.—*Lancet*, Jan. 10, 1880.

The Relationship of Bright's Disease to other Diseases. The Primary Forms of Nephritis.

In our preceding number (p. 164), we gave at some length the results of Prof. Bamberger's researches into the connection between the secondary forms of Bright's disease and the diseases in which they originate.[1] We now propose to follow him in his investigation of the primary forms, and especially of their sequelæ. It will be remembered that the total number of primary and secondary cases of nephritis examined by Professor Bamberger was 2430, and of these 807 were primary—that is, cases either of parenchymatous (tubular) or of interstitial nephritis occurring in previously healthy subjects. Professor Bamberger remarks at the outset that the origin of the disease can only be referred in a minority of the cases to catching cold or getting wet; in the majority it cannot be explained even after the most careful clinical inquiry. The 807 primary cases included 67 acute, 357 chronic tubular, and 383 interstitial nephritis.

The sexes were represented by 445 males, or 55 per cent. of the whole number, and 362 females, but Professor Bamberger shows that the proportion of female to male cases is not accurately brought out by these figures. According to the ten years' mean the proportion of male to female patients of all kinds in the Allgemeines Krankenhaus at Vienna is as 63 to 37. Hence, if primary Bright's disease were equally common in both sexes, the numbers should be 508 males and 299 females; whereas, in fact, the preponderance is on the side of the females in the cases before us; and if the secondary forms associated with pregnancy and parturition were included, it would be still greater.

The ages of the primary cases for each decennial period are given in the following table. Professor Bamberger states that the majority of cases of acute nephritis (54 out of 67) occurred between ten and forty years, of chronic parenchymatous nephritis (214 out of 357) between thirty and sixty, and of granular contracted kidney (238 out of 383) between forty and seventy years.

Decennial period.	No. of cases.	Males.	Females.
1	1	—	1
2	50	33	17
3	121	64	57
4	149	93	56
5	156	94	62
6	152	78	74
7	115	57	58
8	55	22	33
9	8	4	4

The sequelæ, or the diseased conditions which complicate the later stages of the chronic forms of primary Bright's disease, offer more interest than the (at present) barren subject of the etiology of the latter. Beginning with affections of the brain, we find that cerebral hemorrhage occurred in 82 of the 807 cases, 52 of these being associated with granular kidneys. Two points are worth notice here: first, the great size of the extravasations in the apoplexy of Bright's disease; and, secondly, the frequency with which the renal mischief escapes detection *intra vitam*, so that apparently healthy individuals are suddenly and nexpectedly struck down by fatal hemorrhage. Encephalitis, with localized foci of inflammatory softening and meningitis, are both of rather rare occurrence. The latter, especially the tubercular form, is a much commoner feature in second-ry than in primary Bright's disease. Pneumonia, on the other hand—to turn o diseases of the lungs—is very common, and 163 cases, or 22 per cent., were mplicated with it. It generally is of the croupous lobar kind, and here again e elderly people whom it kills are often only found to be the subjects of granular dney (interstitial nephritis) in the post-mortem theatre. Recent pleurisy, nerally of a fibro-serous character, and uncomplicated with pneumonia or any er lung affection, occurred fifty-seven times, or in 7 per cent. of the cases. e other chief sequelæ of Bright's disease observed by Bamberger—excluding rt diseases, which will be presently considered by themselves—were peri-itis (22 cases, or 2.7 per cent.), dysentery, and extensive intestinal catarrh, ticularly the former (109 cases, or 13.5 per cent.), and general dropsy (215 s, or 26.6 per cent.). Bamberger considers the dysentery as very probably to the transudation of urea into the bowel, and its conversion there into stic ammonium carbonate, according to the theory of Treitz,[1] to which he rs.

---

[1] Volkmann's Sammlung Klinischer Vorträge, No. 173.

Of all the pathological changes secondary to Bright's disease which the heart rgoes, none is, of course, so important as hypertrophy; fatty degeneration pericarditis, generally serous, are, however, not so very rare, and the former found in 97 cases, the latter in 99, 64 times as recent inflammation. Endo-ditis and myocarditis are both so seldom met with as to need no further men- here. On the other hand, the frequency of cardiac hypertrophy and dilata- is most remarkable. Of Bamberger's 807 cases of primary Bright's disease, occurred in 344, or 42.6 per cent. of the whole number. For the sake of vity, we append a table of the different combinations of hypertrophy and tation which were associated with the three forms of nephritis adopted by berger in his classification. It shows that the right side of the heart is er, the left side often, alone hypertrophied. That excentric hypertrophy of whole heart is the most frequent condition (in 41 per cent.), and excentric ertrophy of the left side (31 per cent.) the next in frequency, while simple ertrophy of the whole heart and simple dilatation are rare.

	FORM OF BRIGHT'S DISEASE.			
	Acute.	Chronic tubular.	Atrophic (granular).	Total.
Excentric hypertrophy of whole heart .	3	51	88	142
Excentric hypertrophy of left ventricle .	4	38	65	107
Simple hypertrophy of whole heart .	2	3	6	11
Simple hypertrophy of left ventricle .	2	24	39	65
Simple dilatation of whole heart . .	4	5	7	16
Simple dilatation of left ventricle . .	0	1	2	3
Total . . .	15	122	207	344

But what a careful reader will at once notice in this table is that, as Bamberger s, "Hypertrophy of the heart occurs in every period of the disease, but with ater absolute as well as relative frequency the longer the disease lasts." 122, or more than a third of the 344 cases, were associated with paren-ymatous, or tubular, nephritis; whereas it is generally taught and believed, especially in England, that cardiac hypertrophy is the appanage of interstiti nephritis. Bamberger's position on this question is as follows: After studyin it carefully for years, he finds that cardiac hypertrophy is met with in both forms primary chronic Bright's disease, but decidedly more often in the interstitial form Its relative frequency in the latter is, however, not sufficient for it to be made point of distinction between tubular and interstitial nephritis; and he regar the difference between the two forms in this respect, not as the result of differen pathological processes, but *of the longer or shorter duration of the ren affection.*

---

[1] "Ueber urämische Darmaffectionen" (Prager Vierteljahrschrift, 1859, Band iv.).

Before entering into a short discussion of Bamberger's theory of the actu cause of the hypertrophy, it may be interesting for a moment to illustrate by figures the remarkable way in which certain of the complications of prim Bright's disease increase in frequency directly as the duration of the malad while others, on the contrary, diminish in the later and reach their maxim in the middle period. The latter statement is true of pneumonia, pleuris dysentery, and general dropsy.

COMPLICATION.	PERCENTAGES. Acute.	 Chronic tubular.	 Atrophic interstitial
Fatty degeneration of the heart . .	6.0	12.0	13.0
Cerebral apoplexy	1.5	8.0	13.6
Encephalitis	1.5	3.0	4.4
Pericarditis	3.0	8.4	14.4
Cardiac hypertrophy	22.4	34.2	54.0
Pneumonia	2.0	22.0	19.0
Pleurisy	7.5	9.0	5.0
Dysentery	12.0	16.0	12.0
Dropsy	33.0	33.0	19.0

Without discussing this table in detail, we cannot help noticing the la percentage of cases of cardiac hypertrophy (nearly half) associated with acute and chronic tubular forms of Bright's disease. It will be seen that Ba berger's statement that cardiac hypertrophy occurs in all stages of prim Bright's disease, but with greater relative frequency the more chronic the latt is fully borne out.

And now we come to the question of the actual connection existing betw the renal and cardiac affections, as to which Bamberger admits two possibiliti either the hypertrophy depends on the renal disease, or both are dependent a third common factor. The possibility of the renal disease being secondary the hypertrophy is of course excluded in dealing with "primary" Bright's ease. After discussing the various theories which, from Bright onwards, been offered in explanation of the hypertrophy, Professor Bamberger come the conclusion that there is nothing else for it but to accept the first possibil just mentioned, and then to explain the changes in the heart on mechani principles by the accommodation of the organ to increased demands on its pelling powers. At first sight this looks only like Traube's theory over ag (increased work from destruction of renal structure, and impediment to excret of water from the system); and in reality the two theories are not dissimi Bamberger, however, considers the renal process *per se* as only effective far as it interferes with the urinary function. He believes that the ca hypertrophy is the result of "the absolute increase in the general mass of blood owing to the diminished excretion of water by the kidneys." The ca of affairs, according to him, runs thus: Excess of water in the system raise arterial blood pressure, the left ventricle dilates and hypertrophies, and th more blood into the veins; hence venous plethora, more work thrown on the right side of the heart, and dilatation and hypertrophy of the right ventricle. This theory, as Bamberger himself admits, is open, among others, to one principal objection—that while retention of water in the system is certainly of common occurrence in the more acute forms of primary Bright's disease, in many chronic cases, and especially in those of so-called contracted kidney (where cardiac hypertrophy is most pronounced), there is an apparent polyuria. To this, however, he replies that we know scarcely anything clinically of the early stages of contracted kidney; but we are almost certain, from the anatomical researches of Klebs, Buhl, and Thoma, that the progressive changes by which the urinary tubules are gradually surrounded by connective tissue, and their epithelial structures destroyed, must for a time at least diminish the excretion of water through the kidneys. It is during this period that Bamberger assumes the development of the cardiac hypertrophy. The polyuria, as we understand him, occurs later, when the collateral circulation in the kidney, which Thoma has especially described (*Virchow's Archiv*, Band 71), has established itself. A second and somewhat trifling objection to the theory is, that cases of anuria prolonged for one or two weeks have been recorded without the development of cardiac hypertrophy. Bamberger points out that not only must we know whether water was drunk, and in what quantity, during the anuric period, to form a judgment on these cases, but that the impaired state of the patient's nutrition must be remembered too. He regards them as difficultly explicable exceptions to the general rule. A third more important objection is, that retention of water ought to cause dilatation either of the whole vascular system, or at least of the arterial portion, which it has not been proved to do. The answer here is, first, that the subject has as yet been but little investigated; and, secondly, that it is very difficult to assign a mean circumference to the various portions of the aortic system, but that measurements which have been made (by Ewald) do show some increase in the circumference of the aorta under these circumstances. A final objection, that other diseases of the kidney which limit its secretion do not cause hypertrophy of the heart, is met by the answer that such diseases (cystic degeneration, multiple abscess, cancer, echinococcus, etc.) are not only very rare, but that they seldom fulfil the conditions necessary to the development of hypertrophy—sufficient duration of the disease, which must be bilateral, and which must not materially affect the volume of the blood, or greatly impair the general health. As a fact, cases in point have been reported by Cohnheim, Galabin, Müller, and Bamberger himself. And what becomes, it may be asked, in Bamberger's hands, of the other theories of the origin of cardiac hypertrophy in renal disease? Traube's theory, as we have seen, he partly accepts and partly rejects.

Bright's original theory, that the heart enlarges owing to some change in the quality of the blood, as well as Senator's, in which urea is the substance that raises the arterial pressure in parenchymatous nephritis, and Ewald's,[1] in which a change in the blood, due to the renal disease, increases the resistance in the systemic capillaries, he rejects. He admits the possibility, but not the probability, of such a mode of origin of the cardiac hypertrophy. In the same way he refuses to admit Buhl's idea,[2] that the heart changes are due to previous inflammation, which occurs at the same time as, but independently of, the renal disease. Two facts he specially points out are fatal to Buhl's theory—first,

[2] Ibid., vol. i. 1879, page 648. See Monthly Abstract, 1879, pp. 19 and 455.

that inflammatory affections of the heart are of late occurrence in Bright's disease; and, secondly, that Buhl himself found all traces of inflammation absen
in 21 per cent. of his cases of cardiac hypertrophy and renal disease.

Lastly, Bamberger rejects the essentially identical theories of Dr. G. Johnso
and of Sir William Gull and Dr. Sutton, which refer the cardiac hypertroph
to a general affection of the small arteries and capillaries either in the form
muscular hypertrophy or of "hyaline-fibroid" degeneration. He admits th
Dr. Johnson is right in describing muscular hypertrophy of the systemic arteriol
with diminution of their calibre, but he denies that it precedes the cardiac hype
trophy, or that there is any proof that it does so, and he ascribes it to the i
creased arterial pressure which is the result of the heart-change. He also poi
out that these theories fail to explain the hypertrophy of the *right* side of t
heart. It should be added that Bamberger is of Dr. Johnson's opinion, th
arterio-capillary fibrosis, or "hyaline-fibroid" degeneration, is a product
microscopical preparation. In conclusion, if we may be allowed to express
opinion on the work of so eminent a man as Bamberger, we should be inclin
to say that even *his* theory scarcely answers to the requirements of a good theory
namely, that it shall explain all the facts naturally and without being strain
It is, however, a good theory in this respect: that it suggests several points
future inquiry, which may be very fruitful in directing us to the true *ration*
of the connection between cardiac hypertrophy and renal disease. Might
suggest that we know too little about the reason for the altered function of
skin in chronic Bright's disease? Why do patients thus affected cease to p
spire, and why does their skin became so dry and unaffected by the ordin
stimulants of the sweat-glands? In diabetes we can understand that the dry
is caused by the drain of water from the body; but in Bright's disease, wh
more or less retention of water is the rule, the explanation is difficult. Possib
whatever the cause, one of the factors in the production of cardiac hypertro
is this impaired function of the skin; in any case the phenomenon is of g
interest, and deserves more attention than it has yet received.—*Med. Times &*
Gazette, Jan. 10, 1880.

Surgery.

Recent Researches in Pyæmia and Septicæmia.

A most valuable scientific summary of clinical reports and pathological resea
will be found in the new volume of the *Transactions of the Pathological Soci*
We refer to the report of the Committee appointed by the Society to investig
the nature and causes of pyæmia, septicæmia, and purulent infection. It co
sists of statistics collected from 1869 to 1878, in the London hospitals; of o
hundred and fifty-six detailed reports of cases, arranged according to their cli
cal and pathological features, and compared with diseases produced artificially
animals; and of observations on the blood, urine, and microscopical appearanc
of organs in typical cases.

The greatest mortality from pyæmia, during these ten years, was in 1874-
The early spring of 1874 was very warm, but the month of May very col
severe winter set in on November 20th; and the rain-fall for the whole ye
was much below the average. The last half of the succeeding year w
cold and damp. The monthly death-rate is greatest, according to this report,
February and March. The Committee invite inquiry as to the significance
these meteorological facts. The undue closing of ward windows during ea

winds, or at a sudden fall of the temperature after a run of fine early spring weather, or the great space of time from the last annual hospital cleaning, may explain the meaning of these two bad years and months.

The difficulty of defining the term "septicæmia" is dwelt upon, and, after uotations of the definitions of Burdon Sanderson, Billroth, and other authori- es, reference is made to Koch's well-known experiments, which had the practi- al result of distinguishing a "septic or putrid examination" from a "septic or utrid infection." A heavy dose of putrid fluid, injected under the skin of a ouse, killed it in a few hours by pure chemical poisoning, leaving no signs of lammation; nor could any bacteria be found in the animal's blood, which fluid oduced no ill effects when injected into another mouse. But, when a small ount of the same putrid matter was injected, the mouse in some instances re- vered; but in others, after about twenty-four hours of immunity, fatal symp- s of acute blood-poisoning set in; the blood, which was charged with bacilli, ame highly infective to other animals, and œdema was found around the in- tion-puncture. The first condition—septic intoxication—to occur in man, t presume the admission of a considerable amount of putrid blood; so that y be expected only after operations involving large irregular wounds, or serous synovial cavities which have rapid powers of absorption, or in a case of acute ess opened externally by an insufficient aperture, leaving septic matter pent a sufficiently high degree of pressure to allow absorption through the granu- -tissue of the walls. In twenty-eight cases of fatal blood-poisoning, with- formation of secondary centres of inflammation, only two seem entitled to be ed as "septic intoxication," but on evidence admitted not to be conclusive. much to be regretted that cases of ovariotomy were not recorded, as, after operation, the conditions of septic intoxication are all present; and hence complication often appears, or at least did so before drainage and antiseptic autions came into vogue.

e clinical distinction of septic infection from septic intoxication is beset with ulties, though the former must be the more common disease. It may be sus- ted to exist in its pure form when a wound is too small to allow the rapid en- ce of a dose of poison sufficient to produce septic intoxication. A large d may, of course, involve septic infection; but, as it might be then asso- ed with septic intoxication, the former could not, in such a case, be studied in purest form. Evidence of infection from patient to patient is conclusive as a ection, when it exists, as it cannot occur in pure septic intoxication; but ab- of such evidence does not prove the contrary. Out of twenty-eight cases ood-poisoning, in which death occurred without the formation of secondary ses, the Committee could only find two arising from wounds too small to enough septic matter to produce direct septic intoxication. Contrary to th's assertion, rigors were frequently observed in the reported cases of pure cæmia. In many instances, the period of invasion was very late, yet no dary centres of inflammation could be detected after death. In other words, cæmia is not a mere early form of pyæmia.

s to pyæmia itself, the Committee prefer to understand the term in the sense which it is defined by the College of Physicians. The effects of injection of experimentally are described, according to the experience of various authori- Inoculation of an animal with the blood or discharges from a case of pyæmia man has never resulted in the precise reproduction of that disease; but, on rring to Appendix III. of this report, we find a record of Birch-Hirschfeld's periments, which show that the injection of healthy pus produces nothing be- d transient fever; whilst pus containing micrococci caused severe fever, puration around the seat of injection, and, in a few cases, metastatic abscesses.

The Committee have classified cases of pyæmia in groups, according to the presence, association, or absence of each and of all of the well-known pathological features of the complaint—such as visceral abscesses, thrombosis, embolism, etc. Separate classes are also made for cases of pyæmic symptoms following acute necrosis and infective endocarditis; also for "spontaneous" septic disease; and for the "infective myositis" of Nicaise, of which one case is given in the statistics.

The blood was minutely examined in eighteen cases. The white corpuscles were nearly always greatly in excess, both absolutely and relatively, to the red, without the changes in their characters as seen in leucocythæmia; the amœboid movements remained natural, or were unusually active. The proportional increase ranged from one white among one hundred red corpuscles to one white among eighteen red. As to the absolute increase, whereas, under the usual method of inspection and calculation, 2.5 white corpuscles were found on the field when healthy blood was examined, the lowest average on the field in pyæmia was twelve, and more than seventy in cases sometimes seen. The evident diminution of red cells must be taken into account.

The examination of the blood for bacteria yielded very different results in many cases. As to the statement that micrococci may be found in large quantities in the white corpuscles, the Committee could not recognize such a condition in any case; the difficulty of distinguishing these germs in the liquor sanguinis is dwelt upon. Half-a-dozen varieties of bacteria were found; and, in conclusion, so far as these observations go, it is shown that "no one form of bacteria is peculiar to any one kind of disease."

No special characteristic could be found distinguishing the urine in cases of blood-poisoning from that of any acute form of pyrexia. It was generally acid, very soon becoming ammoniacal, and was about normal in quantity in the majority of cases. Albumen, never in excessive psoportions, was nearly always present; urea was excreted about one-fourth above the normal average; and uric acid in double the amount of the healthy excretion. The inorganic constituents, especially the earthy phosphates, were diminished in quantity. Although the red corpuscles are diminished or destroyed, no potash is thereby set free in pyæmic urine; for that base is found below its normal proportions. Possibly, it is remarked, the increase of white corpuscles may account for the potash not being present in greater quantity in the urine after the destruction of the red. In scurvy, there is likewise diminution of the number of red corpuscles and diminished excretion of potash in the urine, that base being possibly retained in the blood to maintain its alkalinity, lessened by the withdrawal of the alkaline carbonates of the food.

On microscopical examination of different organs, micrococci were found in all, or at least in some, of the viscera, and their distribution is very unequal. They were nearly all in the bloodvessels, completely plugging capillaries; in masses which sometimes produced varicosities, or even ruptured the vessels, and extended into the contiguous tissues. Great pathological changes were often found in structures infected with micrococci, yet sometimes the immediate surroundings of these organisms presented little, if any, alteration from the normal condition. In larger vessels, the micrococci may line the walls as an even layer, or project from them as papillæ, which occasionally break off, and in all cases may involve coagulation of the blood passing by them. Bacteria were found in three cases, but in two there was evidence of their origin being *post mortem;* in the third, a case of acute infective myositis, rod-shaped bacteria were present in large areas within the wall of the left ventricle, within and around the vessels, and between the muscular bundles, but hardly any could be found within the sarcolemma.

This appearance is represented in one of Dr. Greenfield's beautiful microscopic drawings, which, together with an equally fine series illustrating Mr. McCarthy's observations, accompany the report.

The obliterative endoarteritis was very frequent in arterioles in all the tissues ;
thrombi were commonly found in the vesicles. The walls of veins containing
thrombi were often surrounded by minute abscesses, and partially destroyed, so
to be indistinguishable, except by the proximity of the corresponding arteri-
s found alongside the abscesses. The connective tissue had in all organs un-
gone changes—such as hypertrophy, increase of nuclei, swelling of the fibrous
dles or miliary abscesses.

Micrococci were seen in the liver, but not so frequently as in the kidney. They
e mostly in the capillaries. Owing probably to embolism, certain acini were
d to be in a very degenerate condition ; whilst others, near them, remained
ost unchanged. In all cases there was some exudation in the portal spaces.
e hepatic cells showed signs of more or less fatty degeneration, and in one in-
ce there was a remarkable segmentation of their protoplasm. In the kidney,
rococci were almost constant ; their favourite seat was in the capillaries sur-
ding the straight tubules in the upper part of the Malpighian pyramids. The
eruli undergo great changes, described very minutely in the report, together
some original observations on peculiarities in the epithelial lining of the
iferous tubules. Micrococci were found in the substance of the valves of the
, and in vegetations from those valves, in two cases of ulcerative endocardi-
In the lung, thrombi, plugging the veins and filled with microccocci, were
rved ; and in one instance, the wall of the vessel being ruptured, blood had
e extravasated with micrococci into surrounding structures.

o this report are added two valuable statistical appendices, and two, consist-
of "notes," or rather of records *in extenso*, of the microscopical examination
e blood during life, and the pathological histology of blood-poisoning. Drs.
e and Greenfield, Messrs. Beck and McCarthy, deserve the thanks of the
ession for having brought together such a mass of valuable facts in relation
e of the gravest classes of diseases with which the surgeon has to deal. We
continue to sympathize with these gentlemen, as we have done before, in
nting, as they do, the absence of a uniform methodical system of registra-
throughout the various metropolitan hospitals. Until this is effected, the
ession will not be perfectly free from Bacon's reproach. "The direction of
e judgments," as he would have said, is not promoted by the neglect, at some
tions, of recording details which, at others, are carefully saved from ob-
.—*British Medical Journal*, Jan. 24, 1880.

Retinal Changes in Kidney Disease.

e frequency with which retinal changes are found in kidney disease has been
usly stated by different authorities. Earlier statistics were based on affec-
of vision, and the frequency assigned was altogether too low, while some
thalmic surgeons, seeing cases only in which sight was impaired, have thought
retinal changes were almost invariable. WAGNER found albuminuric reti-
in 9 per cent. of the cases, GALEZOWSKI in 33 per cent., and LAUDOUZY
almost every case. It is, however, well known that the frequency with which
al changes occur varies much in different forms of kidney disease, and it is,
refore, desirable that in observations which are made, the forms of kidney
ase should be distinguished. This has been done by Mr. EALES, of Birming-
, who in an interesting communication to the current number of the *Birming-*
Medical Review, has described an investigation of the state of the retina in

one hundred cases of granular kidney, the primary object being to determine the percentage of cases in which retinal changes are present. For the diagnosis of the renal disease in every case Dr. Saundby was responsible. The results contained confirm nearly the statement of Galezowski, alterations being found in one-third of the cases. They confirm also the fallacy of taking sight as the test of retinal integrity. In forty-six cases inquiries were made as to the state of vision before atropine was instilled; in twenty-eight of these complaint of bad sight was made, but in only six (that is, a little more than one in five) could any obvious abnormal condition be discovered in the retina; while in eighteen persons, who stated that their sight was good, retinal changes, such as specks, were found in five. The frequency with which considerable retinal changes do not materially impair sight is shown by six cases in which vision was carefully ascertained by test-types and lenses, and found, even with dilated pupils, to be nearly normal, and yet in all considerable changes were found in the retina.

The number of cases in which some abnormal change was found in the retina was twenty-eight, in twelve of which the changes existed in both eyes, while in sixteen they existed in one eye only. Observers have usually described the changes as bilateral, and Mr. Eales thinks that his observations can only be reconciled with those of others by supposing that the affection often attacks one eye before the other, and that it gets well in one eye before the other. In the twelve cases in which changes were found in both eyes, four had diffuse retinitis, with "fibrinous" patches and œdema, and also whitish glistening patches; one had diffuse retinitis in one eye, with only one hemorrhage in the other eye; five had many whitish round patches, "of the atrophic kind," and two had only similar small patches. Of the sixteen cases in which changes were found only in one eye, in six several white round patches were found, in five one or two spots only; in one there was a single hemorrhage near the disk; in two a few black specks were found, associated in one case with white specks, the black being in the centre of the white speck. In addition to these twenty-eight cases of retinal change, three others presented slight changes in the papilla, commencing or subsiding neuritis. In fourteen cases opacity of the lens existed, double and incipient in eleven cases, single in three cases. The presence of these alterations bore some relation to the amount of albumen in the urine, and one in every two patients with constipated bowels presented retinal changes, while such changes were found only in one in every six with open bowels.—*Lancet*, Jan. 31, 1880.

On the Surgical Treatment of Intestinal Obstruction.

A recent discussion at the Society of Surgery of Paris between MM. Terrier, Duplay, Polaillon, Tillaux, L. Le Fort, Ledentu, and Trélat, turned upon the subject of intestinal occlusion and its treatment. This subject has been so recently discussed by English surgeons, that it will be a matter of interest to summarize the recent opinions of the younger school of French surgeons. M. TILLAUX observed that the surgery of the abdomen is undergoing, at the present time, transformation. "I am convinced," he said, "that if M. Nélaton had taken part in the present movement in surgery, if he had seen the abdomen opened with the security that now belongs to this operation, he would have accepted gastrotomy. Enterotomy" (formation of artificial anus), he added, "is not a rational operation." Up to this time, enterotomy has been considered as a true benefaction. It was the only admissible operation against internal strangulation. However, the idea of performing laparotomy, *i. e.*, largely opening the abdomen, and of searching for the seat of strangulation, is not new. M. Le Fort, with his well-known erudition, reports cases of Bonnet (1700), of

Nack, and Dupuytren in 1817, who did a gastrotomy, or rather a laparotomy, for intestinal strangulation on a patient in the wards of Récamier. Since then, this operation has been performed a great number of times. Adelmann, in 1863, reported thirty-three operations of laparotomy, practised for various auses. There were fourteen cures, and nineteen deaths. Ashhurst, in 1874, ave more complete statistics, and classed amongst them cases of invagination. Thirteen operations gave five cures, and eight deaths. To these cases, M. Le Fort adds those of Miller, who cured a child of seven months by laparotomy; o those of Hutchinson and of Fagge.

In a thesis supported before the faculty in 1872, Dr. Delaporte, a pupil of M. inet, affirmed that laparotomy was far from being such a dangerous operation had been hitherto alleged, and he reported fourteen cases giving a proportion eight cures, that is, 57 per cent. M. Bulteau has collected, in a recent *hèse de Paris*, 92 cases of intestinal occlusion, in which laparotomy had been ctised. An analysis of these 92 cases gives the following results. 1. In ety-two operations of laparotomy, there were thirty-three cures and sixty-e deaths, that is, 36 per cent. of cures. 2. In twenty-one operations of lapar-my in cases of invagination, there were eight cures and thirteen deaths, or per cent. of cures. 3. In seventy-one operations of laparotomy in all kinds occlusion other than invagination, there were twenty-five cures and forty-six ths, that is, 35 per cent. of cures. These statistics have only a relative value. e of M. Bulteau are incontestably in favour of laparotomy. Equally satis-ory statistics are required in the case of enterotomy and artificial anus. In patients, Nélaton had two successes. M. Ledentu says, that in four opera-s he had three deaths, M. Polaillon has practised enterotomy five times on method of Littré. All cases proved rapidly fatal, with the exception of one ich lived fifteen days. In six cases, M. Tillaux had only one success, in a erous patient. Statistics are entirely wanting to enable us to compare the pective value of enterotomy and laparotomy. However, it seems from the resting discussion which has just taken place in the Société de Chirurgie, that surgeons are agreed that, in certain cases, laparotomy is to be preferred.

These are the reasons which M. Le Fort gives. "We do not possess, or at t I do not know of, statistics of operations of colotomy; but, from what I e seen of my own practice and in the practice of my masters and my col-gues, I think that cure by colotomy is exceedingly rare. I have lost all my cases; and M. Verneuil, whose practice is more extensive than mine, tells that he has not a single case of cure. Further, enterotomy, though it may ve the patient in allowing evacuation by the upper end of the intestine, does ng to cure the disease. The structure, or invagination, or the volvulus, still s; and if the intestine is much strangulated—and if, therefore, its vitality ch compromised—one may be quite certain that peritonitis will ultimately e fatal to the patient. Enterotomy causes the intestine to be wounded, which rotomy avoids; and, considering the susceptibility of the visceral peritoneum, icularly the intestinal peritoneum, which is extremely vascular, to peritonitis, eing much more irritable than the parietal peritoneum, the fear of an error in gnosis should make one hesitate to perform enterotomy; but if the surgeon , at the moment of operation, reason to regret having made an error in diag-is, this error is irreparable if enterotomy is performed. Laparotomy, on the er hand, permits one to recognize the error, and thereby prevents useless erference."

M. Ledentu said: "The real advantage of laparotomy is, that if it suc-ds the course of the fecal matters is re-established, whilst enterotomy exposes e patient to a persistent and most painful infirmity. If, however, after this latter operation, the intestine is reopened, how many times can one count upon this result? No one can say. To enable one to interfere at the right moment, laparotomy is a resource much more rational, and perhaps less perilous than the purgatives with which one ordinarily tries to overcome internal strangulation."

M. LUCAS-CHAMPIONNIÈRE went further. He said: "The operation is excellent; we have only to discuss the right opportunity for laparotomy; we must reject the operations which penetrate the lateral walls through the muscles, as much the more complicated; and though laparotomy may present serious difficulties they are not insurmountable by the surgeon, particularly the escape of the distended intestinal loops."

In reply to the question in what cases laparotomy should be employed, M. Bulteau replies as follows. 1. In all cases of acute intestinal occlusion, as soon as the ordinary medical means employed have failed, gastrotomy should be practised. The nearer gastrotomy is to the commencement of the accidents, the greater is the chance of success. 2. In chronic intestinal occlusion, sometimes gastrotomy, sometimes enterotomy, and sometimes lumbar colotomy should be employed. (*a*) Gastrotomy should be practised in cases of chronic intestinal invagination, when insufflations of air, injections of water, and the application of electricity have not been able to reduce the intestine. To reduce invagination, which is often difficult, the method of Hutchinson should be employed. According to him, "the lower part of the invagination should always first be sought for, and the reduction attempted by squeezing the intestine, or by pulling at the invaginating portion rather than by seeking to directly extricate the invaginated loop." (*b*) In occlusion of the large intestine, if the precise seat of the obstacle be not known, cæcal enterotomy should be performed. (*c*) If the examination of the patient allow one to determine that the seat of occlusion is in the course of the sigmoid flexure, and of the rectum, Littré's operation of enterotomy should be practised in the left groin, or better still, lumbar colotomy of Amussat. (*d*) In all the other varieties of chronic occlusion of the intestines, Nélaton's enterotomy should be performed in the right iliac fossa.

What method of laparotomy should be employed? Methods vary. M. Parisse, of Lille, makes his incision in the right iliac fossa for two reasons; first, because it is by visual examination that one has the best chance of meeting with the strangulation; secondly, because one finds in the right iliac fossa a landmark which is certain and easy of recognition—the cæcum. Other surgeons make a very large incision in the linea alba. By this method, one is not at all interfered with by intestines, even when distended, in the search for the seat of obstruction. "One is struck," said M. Lucas-Championnière, "with the facility with which the search is made. In both operations, it is the cæcum by which the surgeon may guide himself, in the sometimes difficult search for the strangulated place. If the cæcum and the large intestine be collapsed, one will be sure that the obstacle is seated in the small intestine. On the contrary, if the cæcum and a part of the large intestine be distended by gas and fecal matters, one may be sure that the obstacle is seated at some point of the large intestine." "The surgeon may, therefore," says M. Bulteau, "determine the seat of the obstacle as soon as the belly is opened, without, so to speak, touching the intestinal mass." If the cæcum and large intestine be collapsed, the surgeon should examine the right iliac fossa and the inferior extremity of the ileum, starting from the point at which this intestine opens into the cæcum; he will arrive inevitably and rapidly at the seat of the obstacle by continuing his search along the small intestine. The statistics of intestinal occlusion show in a palpable manner that, in the cases of occlusion of the small intestine, the obstacle is seated almost always in the right iliac fossa, and almost always in the lower part of the ileum. The urgeon, by examining first the right iliac fossa, has, therefore, a great chance of pidly meeting with the obstacle which he wishes to remove. If the cæcum be istended by gas, the surgeon must then examine the ascending colon, the transerse colon, etc. It is in the large intestine, in fact, that the obstacle is seated, d his examination should be limited to that organ.

The seat of the obstacle to the passage of fecal matters once found, the state f the intestine must be examined. When the intestine is only congested and pears healthy, it may be left in the abdominal cavity, after the strangulation been removed and the wound sutured; on the other hand, if the intestine be rforated or gangrenous at the point at which the strangulation is seated, an ficial anus should be established. The success of the operation depends gely on the rigorous cleanliness observed by the surgeon. The antiseptic thod should be employed in all its exactness, and the same precautions of daging as those for ovariotomy.

. Lucas-Championnière insists greatly on the necessity of opening the belly ely in the median line. The incision in the right iliac fossa, in fact, is too ricted to permit the surgeon to explore sufficiently the cavity of the peritoand to remove the obstacle to the course of the intestinal contents. The ion in the linea alba has the advantage of permitting the recognition of the cle, whatever be its seat. For the rest, it is well known how difficult it is termine beforehand the precise seat of the obstruction. Value of Parallelism in the Treatment of Disease and Injuries of the Hip.

a late meeting of the Medical Society of London (*Lancet*, Jan. 24, 1880), THOMAS BRYANT read a paper on the value of parallelism of the lower mities in the treatment of hip-disease and hip-injuries, with the best means aintaining it. The author first pointed out how it was that, in most of the mities of the lower extremity following a natural recovery with a stiff joint hip disease or injury, the deformity was due to a want of parallelism of the extremities, and then passed on to demonstrate, by means of a simple ment he had constructed for the purpose, that, as a rule, in such cases the mity is produced by the *ad*duction of the affected limb. He conclusively strated that when the hip-joint is fixed in an *ad*ducted position, and the t attempts, for walking purposes, to bring the limb vertically downwards, lvis on the affected side is tilted upwards, and on the sound side downwards, e result of increasing the shortening of the affected limb. On the other when the anchylosed limb is *ab*ducted and the foot is brought down for the e of progression, the pelvic line on the diseased side is lowered, and the d limb is merely apparently elongated; apparent lengthening of the dislimb in hip disease meaning its *ab*duction, and apparent shortening its *ad*n. Under these circumstances it is clear that only by maintaining parallelf the two limbs in such cases can deformity be prevented. For this purpose e of the double splint, which he has had slowly built up under his eye at s, was strongly recommended, for he maintained (1) that it is far more comle to the wearer than any other he had used or seen used; (2) that it most ughly immobilizes the limb to which it is applied; (3) it keeps up wellted, steady, and persistent elastic extension; and (4) maintains absolute lelism of the lower extremities. In children with acute hip disease, the , when well applied, so securely guards against joint movement that the may turn the child over on to the sound side for the purposes of cleanliness,

and lift him for the performance of the natural functions, with freedom and co
fidence. In cases of fracture of the neck of the femur or shaft, the same pri
ciple is applicable and the same splint of value; in proof of which the auth
stated that thirty consecutive cases of fracture of the neck of the thigh bo
occurring in patients averaging seventy-four years of age, left his wards wi
useful limbs; and that out of forty consecutive cases of fracture of the shaft
the femur, in only four, or one in ten, was there any important shortening, su
as an inch. In twenty of the remainder there was no shortening, and in eighte
there was less than half an inch.

Subastragaloid Dislocation.

At a late meeting of the Clinical Society of London Mr. **Pick** read notes o
case of subastragaloid dislocation. A gentleman fell off the roof of an outho
and caught his foot in falling. When seen, the foot was so twisted that the
looked outwards, whilst the astragalus formed a marked prominence below
inner malleolus beneath the tightly-stretched skin; the os calcis projected bey
the outer malleolus, and the lower end of the fibula was prominent. It see
that the os calcis and scaphoid had been displaced outwards and backwa
Attempts at reduction under chloroform, and after division of the tendo Ac
and peronei tendons, failed. Much force was used, the foot was brought
into the natural position, but still the relative positions of the os calcis and
galus remained unaltered. Subcutaneous injection of morphia, and chloro
inhalations were had recourse to for the relief of the severe pain experie
The next day, in consultation with Sir J. Paget, Mr. P. Hewett, Mr. Henry
and Mr. Gage Brown, another attempt at reduction was made under chlorof
At Mr. Lee's suggestion a bandage was placed round the forepart of the foot,
by this means Mr. Lee made extension forwards, whilst Mr. Pick made l
movements. The attempt was successful, and, with the exception of a supe
sloughing of skin, where it had been so much stretched, the case made an
terrupted recovery. It is now three years since the accident, and, beyo
slight limp, there is nothing perceptible in the limb. The contour of the f
perfect. Mr. Pick then described what he thought to have been the conditi
this case. He had seen similar dislocations reduced by slight extension, b
the majority of cases reduction was very difficult, owing partly to the tibia
dons being caught behind the astragalus, but mainly to the interlocking o
bones. The foot is thus displaced backwards, and also laterally. Mr. Ha
had shown the value of forward extension, with the bones of the leg fixed, i
reduction of such dislocations.

Mr. **Bryant** said this was an interesting example of a rare form of i
and he agreed with the author as to the great difficulty of reduction in such
In a case he met with some time ago he concluded that the difficulty was
the cause pointed out by Mr. Pick—viz., that the posterior edge of the astr
was caught between the articular facets of the os calcis. It was not until he
Mr. MacCormac's paper in St. Thomas's Hospital Reports that he saw these
of so-called "dislocation of the astragalus" in their true light. Mr. Lee's
nious mode of reduction favoured the anatomical explanation given.

Mr. H. **Lee** pointed out that in literature, especially French, such dislo
was regarded as a very formidable affair, calling for amputation or excisi
the retention of a useless foot. The whole of the foot was carried outwards
sole was turned directly outwards. He had thought much about the reas
failure on the first attempt at reduction, and, taking this with other cases, h
cluded that, with the exception of Mr. Hancock's case, the failure lay in th
that extension had not been made in the right direction. It had been

parallel to the axis of the limb; but as there were two displacements to deal with,
iz., that of the os calcis from under the astragalus, and that of the scaphoid also,
e concluded that traction of the scaphoid *forwards*, and not downwards, was the
ight course to pursue.—*Lancet*, Jan. 31, 1880.

Hyperostoses Consecutive on Obstinate Ulcers of the Leg.

Dr. Paul Reclus publishes a careful study (*Progrès Médical*, December
. 1879) based on the observation of cases. His conclusions are these. 1.
lcers of the leg may give rise to divers forms of osteo-periostitis in the sub-
ent bones. Exceptionally destructive, the inflammation most frequently de-
mines increase of volume; the bone is then light and spongy, covered with
eophytes. In very rare cases, the tissue of the diaphysis is hard and ebur-
ed, the medullary canal obliterated or narrowed. 2. When the epiphyses
not yet joined, the bone increases in length, and may exceed its fellow by
n 2 to 3 centimetres (⅘ to 1⅕ inch). The osteophytes are more abundant.
vertical osseous diathesis may manifest itself, which shows itself by the ossifi-
ion of the aponeuroses of the ligaments of the vascular and nervous sheaths;
word, of all the fibrous tissues of the leg. 3. From the centre of the ulcer
etimes arise prominent exostoses. These have been taken for syphilitic
s, but the consistence of the tumour and specific treatment will establish
diagnosis. 4. Osteo-periostitis is a grave complication. It is inimical to the
rization of ulcers, compromises the nutrition of the limb, and very often
ers amputation necessary.—*Lond. Med. Record*, Feb. 15, 1880.

Midwifery and Gynæcology.

The Kidney Diseases of Pregnancy.

r. R. Möricke (*Zeitschrift für Gebertshülfe und Gynäkologie*, Bd. v.
t 1) considers that venous stasis is the beginning, the chief etiological fact, of
t cases of nephritis during pregnancy; but he does not deny that other causes
his disease may act during pregnancy as well as at any other time. He has
e careful and repeated examinations of the urine of pregnant women, before
after labour, taking especial note of the presence and amount (as the most
worthy signs of kidney disease) of albumen and of casts. He finds that as
e the urine passed before delivery, even though it contain albumen, yet
few, if any, casts. The first urine passed after delivery contains, on the
ry, casts extraordinary in size and number. The author thinks that a
n change in the circulation is the only agency which could produce so rapid
great an effect. The albumen and casts disappear surprisingly soon, being
etimes completely gone on the second day. Out of twenty pregnant women
e urine the author examined, albumen was present in one; and out of one
dred women in labour, thirty-seven had albuminous urine, and in thirteen
re were casts. In support of his view, that the kidney affection is due to
ous congestion, the author adduces the facts that albuminuria is dispropor-
ately frequent in first pregnancies and in twin pregnancies, and that it is
lly only met with in the later months; that it rapidly disappears when the
us is emptied; that in pregnancy there is obstruction to the return of venous
od, shown by the occurrence of varicose veins and œdema of the legs; that it
hown by experiments on animals, that such venous congestion is adequate to
duce albuminuria, and also by its occurrence in diseases such as valvular in-
mpetence, emphysema, etc., in which there is obstruction to the venous circu-

lation; and he considers that the peculiar condition of the blood in pregnancy such as to favour the passing of the changes due to venous congestion into th of inflammation. To the objection raised, that large tumours are found in abdomen without albuminuria, the author replies, that albuminuria is often with in such cases. To the objection that it is impossible for the pregnant ute to press on the renal veins, he answers that it is not necessary for it to press them directly; its bulk raises the intra-abdominal pressure, and thus hinders return of blood. The argument that albuminuria is sometimes met with in early months of pregnancy, the author meets by stating that he does not as venous congestion to be the only cause. The theory that the liability to nephri is due to increased renal function, he rejects on the grounds that there is no e dence of such liability where one kidney is absent, or has been rendered usele and extra work is thrown on the other; nor is there in diabetes. The view Spiegelberg, that nephritis in pregnancy is due to a reflex action on the va motor nerves of the kidney, Dr. Möricke looks upon as a pure hypothesis.— *stetrical Journal of Great Britain*, Jan. 15, 1880.

—

Puerperal Malarial Fever.

At a late meeting of the Medical Society of the County of New York (*M Record*, Feb. 7, 1880) Dr. FORDYCE BARKER read a paper on the above ject, of which the following is an abstract: Although the title of the paper not yet been added to the nomenclature of diseases in medical literature, it i descriptive of the etiology, pathology, and clinical phenomena of a class of a tions which of late years had been so frequently met with in puerperal wome New York and its vicinity, that he employed it. The author of the paper t presented the character of the disease, its pathology, its differential diagn and its treatment. By the kindness of medical gentlemen who had furnished with complete notes of cases which he had seen with them in consultation, from those in his own private practice, he had the records of seventeen cases, of these he gave a summary of the aggregate results and the conclusions to w he had arrived.

Puerperal malarial fever might make its invasion at any period following turition, until the physiological changes which constitute puerperal convalesc were completed. The earliest development occurred in less than twenty- hours after entirely normal parturition. The history of a case which occurre the practice of Dr. Howard Pinkney was then given. The latest period of vasion was in one of his own patients, who had a normal labour in every resp and her convalescence was so complete that he had begun to make weekly v only. The details of the case were reported. The most prominent *symp* were chills, sometimes very slight, a temperature higher by one or two degr frequently, than was found in the beginning of any other puerperal disease, r pulse, greater prostration than was usual with other diseases during this per After such an explosion, there was a remarkable remission on the following d but the alarming symptoms returned after one, two, or three days, yet usu less severe, only typical cases, presented such a succession of phenomena. Barker was disposed to believe that in the majority of cases the patient, thre four days after the explosion, finds herself suffering from a general sense of mal more or less of pain in the back, head, and bones, thirst, loss of appetite, in nia; and when the disease was developed the chills were less severe, the p less rapid, the temperature not so high, and the remissions less marked; and was also of the opinion that in such cases the disease was more persistent and sponded less readily to treatment. In puerperal malarial fever a fall of temp ture three or four degrees was always attended with a corresponding declin

ther symptoms, which is not the fact in septicæmia, and the latter is rarely ac-
mpanied with pain in the head, back, and limbs. He thought that a competent
d intelligent observer would not be likely to mistake the affection, when devel-
ed six or eight days after confinement, for pyæmia, even though it was devel-
ed late during the puerperal period. Puerperal fever usually appeared between
e first and the third day after delivery, and very rarely after the fifth day, while
e chills were not recurrent, nor were there marked remissions of the symptoms.
alarial fever may be developed during the progress of any of the local phleg-
sia, or may be complicated by them. In five cases, secondary hemorrhage
curred after the twelfth day, apparently as the result of the malarial fever. One
these has already been reported by Dr. H. T. Hanks. In one case, three days
er the hemorrhage, purpura was developed, and there was some oozing of blood
m the nasal and buccal mucous membranes. In four of the cases seen in con-
ltation the chief reason why he was called was that the patient was supposed to
ve puerperal mania. The details of a case seen in consultation with Dr. Barker,
Jamaica, L. I., were then given. But one of the seventeen cases had termi-
ed fatally, and that was in the practice of Dr. William H. Hall. The patient
d on the forty-seventh day after confinement. The history of the case was
en. The author of the paper did not dwell upon the treatment, for the reason
the treatment of malarial fever is so well settled, and every physician of in-
gence and sound practical sense appreciates the necessity for and the kind of
liary measures which the symptoms peculiar to each case may require. He
found Warburg's tincture much more effective and speedy in producing the
lts desired than the largest doses of quinia. His method was to give it in
-ounce doses every four hours until the fever had entirely abated, and then
inuing it in gradually diminishing doses until convalescence is perfectly estab-
ed. On the least threatening of a recurrence a full dose should at once be
inistered. The tolerance of quinia in these cases is very remarkable. One
ient received 80 grains hypodermically within twenty-four hours, and yet no
ptom of cinchonism was produced. When given by the mouth it is usually
bined with bromide of potassium, to prevent or modify the cinchonism.

Dr. S. S. JONES remarked that it had been his fortune to see a great deal of
arial fever in puerperal women within the last two or three years, and some
the cases had been exceedingly persistent and difficult to treat. There was
feature not noticed by the author of the paper, and that was the fact that
ticæmia can occur after the onset of malarial fever in the puerperal condition,
that it may be the occasion of elevation of temperature without remission for
al days, thus accounting for the fact that quinia does not produce its effect
ick as it usually does in pure malarial fever. It had been his habit to give,
g as he did in a malarious district, a dose of quinia on the day following the
inement. In those cases in which fever does not subside after the exhibition
a full dose of quinia, it had been his habit to cleanse the uterine cavity, and
ne or two cases he thought he had almost demonstrated that the cleansing of
uterine cavity was the turning-point in saving the patient's life. A case was
ted. Twenty grains of quinia were given after confinement, and ten grains
ly until the sixth day. The patient was doing well, and the quinia was
itted. On the seventh day a violent chill came on, the temperature rose to
° F., and in spite of large doses of quinia—45 grains in 12 hours—and thor-
h cinchonism, the fever and chills continued for three days. The cavity of
uterus was then cleansed by means of a probe and cotton, and the next morn-
, without the administration of quinia, the temperature was 103° F.; twelve
urs afterward 102° F. The uterine cavity was cleansed three times, and the
tient made a good recovery. The quinia was continued in the treatment, but
not in very large quantity.

In a case of placenta prævia, the temperature, after delivery, rose to 104° F. It yielded to quinia, but the elevation returned, and symptoms of septicæmia followed. The case was treated by cleansing the uterine cavity, in addition to the use of quinia. The point to which he wished to direct especial attention was that when the elevation of temperature persisted in spite of the use of quinia, although there may be no tenderness of the abdomen, and many of the ordinary symptoms of septicæmia may be wanting, we should cleanse the uterine cavity, and not take it for granted that it is not a case of septicæmia.

Dr. **Wm. T. Lusk** remarked that he had not had any personal experience in cases corresponding to the severer form of malarial manifestation in puerperal women, described by Dr. Barker; yet ever since Dr. Barnes read his paper before the American Gynæcological Society, drawing attention to the fact that women living in a malarious region were subject to severe attacks of malarial fever immediately after confinement, his attention had been turned in that direction, and he had watched such cases with a great deal of interest. Within the last three months he had had three cases of the milder manifestations of malarial poisoning after confinement; chill, high fever, profuse perspiration, and all yielded readily to quinia. He regretted that post-mortem data had not been obtained regarding the severer forms. He thought that in some of the cases described by Dr. Barker septic symptoms were superadded, and aided in making them exceptionally severe. In the Maternity Hospital, when the report was made by the House Staff that some of the women had severe chills and high fever, followed by profuse perspiration, and that yielded readily to quinia, he always knew that it was only the forerunner of something more serious, and therefore a warning. If the women were not removed, peritonitis and cellulitis began to appear in other cases and if still the warning was not heeded, there came an outbreak of puerperal fever. He could not but think that, at the bottom of the severe cases at least, there was some other poison than malaria, differing only in intensity, perhaps in the manner in which it enters the system, rather than in the quality and character of the poison itself, and capable of producing puerperal fever. He thought we should be on the alert in making a distinction between this form of poison and that which produces true malarial puerperal fever.

Dr. **Barker** suggested that it was not convenient to obtain post-mortem data unless patients die. Only one of the seventeen cases he had seen had terminated fatally, and in that one the question of septicæmia was thoroughly discussed by Dr. Hall, Dr. Thomas, Dr. Metcalf, and himself, and all were unanimous that there was not the slightest ground for suspecting septicæmia.

Origin and Prophylaxis of Sore Nipples.

Professor **Kehrer**, of Giessen, considers (*Beitrag zur klin. und experimentellen Gebursh. und Gynäkologie*, Bd. ii. Heft 1) a knowledge of the mechanism of sucking to be necessary to the proper understanding of the mode of production of sore nipples. First, the nipple is seized and drawn into the mouth, without, if the tongue is of normal length, the lower jaw touching the nipple. Second, the nipple again becomes shorter, and is drawn back out of the mouth. The well-known lesions of the nipple (chaps, etc.) result from the squeezing of the nipple between the jaws, its rubbing against the hard gums, and its being wetted with milk, and with the secretions of the mouth. The author considers, and etiologically differentiates, vesicular excoriations, semicircular lateral ulcers, erosions at the summit of the nipple, fissures, etc. The conditions upon which the origin of such depends are the power, frequency, and duration of sucking, and the physical peculiarities of the nipple. According to most authors, primiparæ are more liable to these affections; and Kehrer does not agree with Winckel ccording to whom fissures are found as often in pluriparæ as in primiparæ. He as sifted his data, taken from lying-in women both in town and country, and ives for each the number of children born, the number of children suckled, the equency of fissures, and of inflammation of the breast. He finds that these reast affections are so frequent that half of all women in some confinement uffer from them. Breast affections, especially chaps, are 20 per cent. more equent in town than in country patients. They are, of course, more frequent n first lactations; fissures being in these twice as frequent, and mastitis three es as frequent as in others. The greater liability of town patients to sore pples results from their smaller quantity of milk, badly-developed nipples, nner skin, greater vulnerability, etc. For prophylaxis the author recommends e improvement of the nutrition of suckling women, to produce more abundant k, and the drawing out of the nipple during pregnancy, for which purpose e author supplies his midwives with a suitable glass. The early application of India-rubber shield to the nipple is of especial importance. During 1877, out 122 suckling women, 22.95 per cent. suffered from sore nipples; while in 8, out of 103 who suckled from the beginning with nipple shields, only 6.6 ered in the same way. The shields, however, should not in practice be used every case from the beginning, but only where there are small flat nipples, able skins, etc. The author further recommends the application of comes soaked in glycerine. He thinks that hardening of the nipple during pregy by astringent applications is of doubtful utility as a prophylactic.—*Obstetl Journal of Great Britain*, Jan. 15, 1880.

—

Condition of the Cervix in the Non-Pregnant Uterus.

Prof. BANDL contributes to the *Archiv für Gynäkologie*, Bd. xiv. S. 237, an resting paper on this subject. After a somewhat prolonged historical review opinions on the question of the relation of the lower uterine segment to the vix uteri during pregnancy, the author proceeds to maintain that in the virgin rus the cavity of the cervix, as indicated by the mucous membrane, extends ch higher up than is the case with women who have borne children, being ceable to nearly the middle of the body of this organ; that during the first gnancy the upper portion of that cervical cavity becomes gradually transmed into a portion of the body of the uterus, so as to amplify the lower uterine ment, its mucous membrane being changed into a true decidual membrane. er this surface the ovum is adherent. In subsequent pregnancies the mucous mbrane of this upper portion of the cervical cavity never regains the arrangent and characters of a cervical mucous membrane. According to Bandl, refore, in the case of a woman who has borne children, what he calls the ring Müller, which is ordinarily called the internal os uteri, is not the true internal but the lower extremity of this upper permanently transformed part of the vix. The portion indicated is separated from the rest of the cavity of the dy, he asserts, by a distinct narrowing of the uterine walls. According to ndl, therefore, when the cervix is fully dilated during delivery, the cavity ich is ordinarily represented by the fully dilated cervix, as in Braune's plates, not that part of the uterus bounded superiorly by the ring of Müller and feriorly by the outer os, but this together with the altered upper portion. He intains that the original inner os may always be detected, in the case of a oman who has borne children, high up above the ring of Müller, and near the iddle of the cavity of the body of the uterus. Some drawings are produced in pport of this somewhat extraordinary view.—*Edinburgh Med. Journal*, Feb. 1880.

Dilatation Instruments in Gynæcological Practice.

In No. 26, *Centralblatt für Gynäkologie* 1879, Prof. **Carl Schroeder** as the question, "Are dilatation instruments necessary in gynæcological practice?" in reference especially to a paper in No. 25 of the same Journal by Fritsch advocating rapid dilatation under chloroform with steel sounds of gradually increasing size, instead of sponge or tangle tents. Schroeder goes further, an would do away with dilatation in all cases. He proposes, in most cases wher dilatation is ordinarily advised, to remove from the interior of the uterus, fo examination, a small portion of the mucous membrane through the undilat cervix, by means of a sharp curette with appropriate long flexible handle. If fou necessary, the hypertrophied mucous membrane may be entirely removed in th way. If it is really necessary to get the finger into the cavity of the uter Schroeder proposes to divide on both sides the vaginal portion of the cerv throughout its entire length, and then to pass the finger through the inner which in such cases is usually large, by forcible pressure of the index fing Counter-extension is made either by pressure upon the fundus of the uterus, by traction on the neck with a volsella. The incisions made in the vagin portion of the cervix Schroeder unites by suture so soon as the necessary ope tive interference with the cavity of the uterus is effected. [It appears to us th few people will regard the advantages presented by the heroic methods either Fritsch or of Schroeder superior to the ordinary method of slow dilatation by t use of tents.—A. M.]—*Edinburgh Med. Journal*, Feb. 1880.

Medical Jurisprudence and Toxicology.

Effects of Poisoning by Cantharidin.

M. V. **Cornil** has recently made a series of investigations on the lesions the kidney and bladder in rapid poisoning by cantharidin. He finds that ca tharidin, the action of which is simultaneously manifested on other organs of t body, causes in the first instance in the kidney almost immediately after its int duction beneath the skin the diapedesis, or escape of both white and red corp cles from the vessels constituting the glomeruli; and in addition, there appe an impregnation and swelling up of the cells lining the capsules of Malpigh and of the *tubuli contorti*, by a liquid containing hematic granules. After short space of time inflammation of the *tubuli recti* and collecting tubes is o served characterized by a modification of the form of their cells, which, instead presenting their usual definite form, become variable or irregularly polyhedr and this state is very general in the cells of other organs of the body. Th bladder, after the first act of micturition, in which a large quantity of urine discharged, and which occurs about fifteen or twenty minutes after the anim has been poisoned, remains contracted. Its surface is red, it contains a few dro of turbid urine with leucocytes, and very large cells, which may either be sphe cal or elongated and flat. An hour after the injection of the poison these lar cells, which contain from two to eight or ten round nuclei, are either floatin freely in the urine, or are adherent to the surface of the mucous membrane, an about to detach themselves from it. The elongated cells are irregular at thei borders, and present rounded processes. Their protoplasm is granular, solid homogeneous, stains yellow with picrocarmin, whilst the nuclei become red Nuclei may also be seen about to divide, or several smaller nuclei may be see near a larger one.—*Lancet*, Feb. 14, 1880.

MEDICAL NEWS.

Colour-blindness among Railroad Employés.

The Massachusetts Railroad Commissioners, in their Annual Report, consider e subject of colour-blindness among railroad employés, and the necessity of gislation on the subject. They state that in this country examinations have en made by many railroad companies since attention has been called to is subject. Dr. Keyser, of the Wills Hospital, Philadelphia, is reported as ving examined all the employés on all the roads terminating in Philadelphia, cept the Pennsylvania Railroad. His report was that 3½ per cent. "have fects of such a character as to make them really incapable and unsafe to fill e positions they occupy." He found, also, that an engine-man who was green-d never mistakes as to the colour of signals. In Maine, an examination, etofore referred to, was made on the Maine Central Railroad, with results t unlike those of Dr. Keyser.

The final conclusions of the Board of Commissioners are: 1. That the exist-e of colour-blindness, total and partial, is a well-established fact, and that ere are men who, by reason of such defect, are unfit for positions on railroads quiring ability to distinguish colour signals. 2. That the extent of dangerous lour-blindness, *i. e.*, such colour-blindness as unfits persons for railroad employ-ent. has been greatly exaggerated, and that a very small per cent. of persons e, for this reason, unfit for such employment. 3. That examination may be operly made by persons not medical experts; and that such examinations will tainly be sufficient, if doubtful cases are referred to such experts. 4. The ard recommends that every railroad company shall have an annual examina-n of every employé whose duties require or may require capacity to distinguish n or colour-signals, and that no one shall be so employed who has not been s examined. The examination should refer to colour-blindness, and to other fects in vision. It should include all who are in any way concerned in the vement of trains.

The Board does not recommend any legislation on the subject, believing that interest will make railroad managers careful to have examinations as to ur-blindness among employés made, so as to avoid even false charges that dents have resulted from the existence of such defects.

Dr. B. Joy Jeffries has recently appeared before the Railroad Committee of e Massachusetts House of Representatives in opposition to the conclusion of the mmissioners that the testing for colour-blindness among railway employés may safely entrusted to a non-medical man, and showed in great detail how lay-en might be easily misled in making these examinations. He stated that in urope railroad officials were first directed to make these examinations, and had terly failed in finding who were and who were not colour-blind or had defec-ve vision; and he read letters from Prof. Donders and Prof. Holmgren strongly ging that medical experts only could be safely employed in testing colour per-eption and acuteness of vision.

Rapid Cure for a Cold.—R. RUDOLF reports, in the *Gazetta Medicin Italiana*, the following observation made on himself. Being seized with a severe coryza, he happened to chew one or two twigs of eucalyptus, at the same time swallowing the saliva secreted, which had a bitter and aromatic flavour. To his surprise he found that, in the course of half an hour, the nasal catarrh had disappeared. Some days latter, he was seized with another attack from a fresh exposure to cold, when the same treatment was followed by an equally fortunate result. He then prescribed the remedy to several of his patients, all of whom were benefited in the same way. He believes that this treatment is only suitable in acute cases.—*Brit. Med. Journ.*, Jan. 24, 1880.

Bigelow's Operation for Stone.

In a recent number of the *Lancet* (Jan. 10, 1880) Mr. **Thomas Smith**, Surgeon to St. Bartholomew's Hospital, publishes an abstract of a clinical lecture on litholapaxy in which he says of this operation, that it "is a new one, founded on principles different from those which have hitherto guided us in the performanc of lithotrity, and it is possible, or, rather, highly probable, that it will entirel reform our practice in the treatment of stone in adults." In proof of the sta ment that it is new in principle he offers several quotations from Sir Henr Thompson's recent writings.

Boracic Acid in Eye Inflammations.

Dr. **Samuel Theobald**, of Baltimore, recommends (*Med. Record*, Feb. 1 1880) the use of a solution of boracic acid (two to four grains to the ounce) i conjunctival inflammations.

Who Founded the National Medical Library?—For many years there was small collection of medical books and journals in the Surgeon-General's office Washington, which collection was commenced by Surgeon-General Lovell pric to 1836. At the commencement of the War it amounted to between 300 an 400 volumes. During the period of sixteen months ending Aug. 30, 1863, tha Dr. Hammond was Surgeon-General, 359 volumes were purchased for the us of the office, the principal works being sets of two journals. During the yea 1864 and 1865 about 1000 volumes were purchased, mainly works selected b Drs. Woodward and Otis. When the library came under the charge of D Billings, in the autumn of 1865, it contained about 1800 volumes. At present under the intelligent and energetic management of the librarian, Dr. Billings, it contains about 50,000 volumes and 60,000 pamphlets.

Meetings of State Medical Societies.—The following State Medical Societies will hold their annual meetings next month:—

Kentucky State Medical Society, at Lexington, May 4th.
Kansas State Medical Society, at Leavenworth, May 11th.
Michigan State Medical Society, at Grand Rapids, May 12th.
Illinois State Medical Society, at Belleville, May 18th.
Indiana State Medical Society, May 18th.
Missouri State Medical Society, at Carthage, May 18th.
Pennsylvania State Medical Society, at Altoona, May 19th.
New Jersey State Medical Society, at Princeton, May 25th.

—

National Convention for Revising the U. S. Pharmacopœia.—This Conven- n will meet at Washington on the 5th of May.

—

Sanitary Convention.—The National Board of Health requests all quarantine thorities of the United States to send authorized representatives to meet with in Washington on the 6th of May next, for the purpose of amending the rules d regulations prepared by the Board last year and recommended by it to te and local quarantine authorities for adoption.

—

A Substitute for the German "Sapo Viridis."—Dr. GEO. HENRY FOX recom- ends (*Med. Record*, Feb. 14, 1880), as a substitute for the German "green ap," a soft olive soap used extensively in the manufacture of silk and other licate fabrics. This he has tried and found to be a similar, though a far more legant article than the ordinary sapo viridis. It is made from cold-pressed olive- l, and owes its green colour entirely to the chlorophyl of the olive. As manu- ctured by Mr. Bagoe, Pharmacist, of New York, it is of unvarying alkalinity, wholly free from unpleasant odour, homogeneous, and, unlike the common green ap, it gives a perfectly clear solution with strong or dilute alcohol. He has und it advantageous to add to the soap a small percentage of glycerine, which, while counterbalancing the natural loss of free water, renders it a most agreeable reparation. The name "Sapo Olivæ Præparatus" is recommended for this soap.

—

The French Codex.—The Minister of Public Instruction has designated a mmission, with M. Gavarret as President, to revise and publish a new edition f the French Pharmacopœia. The last edition was published in 1867.

—

Naval Board.—The Naval Medical Board of Examiners, which during the past seven or eight years has held its sessions in Washington, has been transferred back to the Naval Hospital at Philadelphia.

It consists of Medical Directors Edward Shippen (President) and George Peck, and Surgeons Newton L. Bates and Thomas N. Penrose. It convened March 1st to examine candidates for promotion and for admission.

—

Test Pellets.—Dr. PAVY recently introduced to the notice of the London Clinical Society a new form of test for sugar. He considered the cupric test by far the most reliable, and this view stood in accord with that which was generally entertained by analytical chemists. It had been hitherto the practice to employ the test in the form of a solution, prepared by mixing an alkaline tartrate with sulphate of copper and either potash or soda. When freshly prepared this solution fulfils all that can be desired; but there is the disadvantage belonging to it that, after being kept for some time, especially if exposed to light and air, it is liable, without the presence of sugar, to throw down a certain amount of reduced oxide on boiling, and thus possibly to mislead unless precautions are taken to provide against it. Dr. Pavy had long felt that it would be very desirable if the ingredients of the test could be incorporated and kept in a solid form; and some years ago he made a fruitless attempt to attain this object. Latterly he had given his attention afresh to the subject, and the test pellets shown were the result of this. They contained the solid ingredients of cupric test solution in a dry state, and they were brought into the condition of a coherent mass by compression. The preparation had been placed in the hands of Mr. Cooper, of Oxford Street, who most successfully met the difficulties that were unexpectedly encountered. There appeared no reason why the pellets should not keep for an indefinite time without undergoing change if preserved in a closed bottle away from moisture. In using them all that was necessary was to place one in a test-tube with about 3 cc., or rather under a drachm, of water, and to apply heat until complete solution had occurred. It formed a clear, deep-blue liquid, which actually constituted the cupric test solution. At present it was only as a qualitative test that the pellets were introduced, but there was no reason that hereafter the preparation should not be conducted with sufficient attention to accuracy of weighing to render them applicable for quantitative analysis.—*Lancet*, Jan. 31, 1880.

—

Liability of Hospitals in Malpractice Suits.—The Supreme Court of Rhode Island, according to the *Maryland Med. Journal* (Dec. 1879), has recently decided that hospital corporations should be considered liable for failure to exercise reasonable care in selecting skilful, competent men as internes. This decision grows out of a case where suit for malpractice was instituted against a Rhode Island Charity Hospital, by a patient whose fingers were cut off by a circular saw. Hemorrhage was excessive, and was only controlled by the use of the tourniquet, which instrument was kept on for seventeen hours. The result was, the arm was amputated at the shoulder joint, the patient affirming that careless treatment, upon the part of the interne, had induced this result. The court directed the jury to give a verdict for the defendant, on the ground that a charity institution should not be made liable for negligence or unskilful treatment. The case was taken to the Supreme Court, with the above decision.

—

OBITUARY RECORD.—At Dublin, on the 1st of February, aged 77, Sir DOMINIC JOHN CORRIGAN, Bart., M.D., Physician-in-Ordinary to the Queen in Ireland.

Sir Dominic was the last representative of the great physicians and surgeons who, by their writings and oral teachings during the second and third quarters of this century, made the Dublin School of Medicine one of the most famous in Europe. His most meritorious writings were an article on Permanent Patency of the Aortic Valves, which led Trousseau to give to the disease the name of "Maladie de Corrigan," his description of Cirrhosis of the Lung, and his lectures on Fever.

—— On the 1st of March, at his residence near Baltimore, WILLIAM MAXWELL WOOD, M.D., late Surgeon-General U. S. Navy. Dr. Wood was appointed Chief of the Bureau of Medicine and Surgery in 1870, and was retired the following year on account of age.

TITLE AND CONTENTS

OF

EMMET'S

RINCIPLES AND PRACTICE OF GYNÆCOLOGY.

SECOND EDITION—Now Ready.

In one very handsome octavo volume of 875 pages, with 183 illustrations.

Price, in cloth, $5; in leather, $6.

The favorable reception which has been accorded to Dr. Emmet's work by e profession is shown by the exhaustion of a large edition in less than one r, and the preparation of a translation in Germany which is now in progress cates the appreciation in which it is held abroad.

In the preparation of his second edition Dr. Emmet has spared no labor to e his work perfect, and the many alterations and additions both in the text l illustrations will serve to enhance the already high favor in which the k is held, and render it a permanent authority on the subject of which it ats.

LEISHMAN'S MIDWIFERY—New Edition—Just Ready.

A SYSTEM OF MIDWIFERY;

INCLUDING THE DISEASES OF PREGNANCY AND THE PUERPERAL STATE.

By WILLIAM LEISHMAN, M.D.,
Regius Professor of Midwifery in the University of Glasgow, etc.

THIRD AMERICAN EDITION, REVISED BY THE AUTHOR.

WITH ADDITIONS, BY JOHN S. PARRY, M D.,
Obstetrician to the Philadelphia Hospital.

In one large and very handsome 8vo. *volume of* 733 *pages, with over* 200 *illustrations; cloth,* $4 50; *leather,* $5 50.

This new edition has evidently been carefully revised by its author, and will be welcomed by those who are trying to keep posted in the rapid advances which are being made in the study of obstetrics.—*Boston Med. and Surg. Journ*, Nov. 27, 1879.

It has been well and carefully written. The views of the author are broad and liberal, and indicate a well-balanced judgment and matured mind. We observe no spirit of dogmatism, but the earnest teaching of the thoughtful observer and lover of true science. Take the volume as a whole, and it has few equals.—*Maryland Med. Journ.*, Feb. 1880.

We are glad to call the attention of our readers to this new edition of Dr. Leishman's well-known work, which has already established itself in general favor both in this country and in America. In noticing this third edition we need only direct attention to the differences between it and its predecessor. Although carefully revised throughout, with not a few additions in various places, the net enlargement amounts only to a few pages.—*Glasgow Med. Journal*, Jan. 1880.

This work is a thoroughly good one, and
well adapted to the requirements of the prac
cal obstetrician. It is something more than
compend designed for the medical student; it
a book to be studied by the practitioner, and
will seldom disappoint him. It is of convenie
size, clearly written, and eminently practic
As such, we heartily commend it to our reade
—*St. Louis Clin. Record*, Jan. 1880.

We gladly welcome the new edition of th
excellent text-book of midwifery. The form
editions have been most favorably received
the profession on both sides of the Atlantic
the preparation of the present edition the auth
has made such alterations as the progress
obstetrical science seems to require, and we
not but admire the ability with which the
has been performed. We consider it an ad
rable text-book for students, during their att
ance upon lectures, and have great pleasur
recommending it. As an exponent of the
wifery of the present day, it has no superio
the English language.—*Canada Lancet*,
1880.

PLAYFAIR'S MIDWIFERY—Third Edition—Now Ready.

A TREATISE ON THE SCIENCE AND PRACTICE OF MIDWIFERY. By W. PLAYFAIR, M.D, F.R.C.P., Professor of Obstetric Medicine in King's College, etc. Third American edition, revised by the author. Edited, with additions, ROBERT P. HARRIS, M.D. In one handsome octavo volume of 654 pages, with plates and 183 illustrations; cloth, $4; leather, $5.

BARNES'S MIDWIFERY—Just Ready.

A MANUAL OF MIDWIFERY FOR MIDWIVES. By FANCOURT BARNES, M.D., Ph sician to the General Lying-in Hospital, London. In one neat royal 12mo. volu of 200 pages, with 50 illustrations; cloth, $1 25.

THOMAS ON WOMEN—New Edition—Lately Published.

A PRACTICAL TREATISE ON THE DISEASES OF WOMEN. By T. GAILLA THOMAS, M.D., Professor of Obstetrics and the Diseases of Children in the Colle of Physicians and Surgeons, New York, etc. With 191 illustrations. Fourth e tion, thoroughly revised. In one large and handsome volume of 800 pages; clot $5; leather, $6.

DUNCAN ON WOMEN—Now Ready.

CLINICAL LECTURES ON THE DISEASES OF WOMEN. Delivered in St. Ba tholomew's Hospital. By J. MATTHEWS DUNCAN, M.D., LL.D., F.R.S.E., etc. one very neat octavo volume of 175 pages; cloth, $1 50.

SMITH ON CHILDREN—New Edition—Just Issued.

A COMPLETE PRACTICAL TREATISE ON THE DISEASES OF CHILDREN. J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children in the Bellev Hospital Medical College, New York. Fourth edition, revised and enlarged. one handsome octavo volume of over 750 pages, with illustrations; cloth, $4 5 leather, $5 50.

HENRY C. LEA'S SON & CO.—Philadelphia.

THE

RINCIPLES AND PRACTICE

OF

GYNÆCOLOGY.

BY

THOMAS ADDIS EMMET, M.D.,
SURGEON TO THE WOMAN'S HOSPITAL OF THE STATE OF NEW YORK, ETC.

SECOND EDITION, THOROUGHLY REVISED.

WITH ONE HUNDRED AND THIRTY-THREE ILLUSTRATIONS.

PHILADELPHIA:
HENRY C. LEA'S SON & CO.
1880.

PREFACE TO THE SECOND EDITION.

THE unusually rapid exhaustion of a large edition of this wo while flattering to the author as an evidence that his labors ha proved acceptable, has in equal measure heightened his sense responsibility. He has, therefore, endeavored to take full advanta of the opportunity afforded to him for its revision. Every page h received his earnest scrutiny; the criticisms of his reviewers ha been carefully weighed; and while no marked increase has be made in the size of the volume, several portions have been rewrit and much new matter has been added. In this minute and thoro revision, the labor involved has been much greater than is perh apparent in the results, but it has been cheerfully expended in t hope of rendering the work more worthy of the favor which h been accorded to it by the profession.

89 MADISON AVENUE, NEW YORK.
February, 1880.

HENRY C. LEA,
in the Office of the Librarian of Congress. All rights reserved.

PREFACE TO THE FIRST EDITION.

THIS work is essentially a clinical digest. It includes the results
my individual experience, and aims to represent the actual state of
æcological science and art.

For the past twenty-five years I have devoted myself to the study
treatment of the diseases of women, and have been continuously
ged in the service of the Woman's Hospital of the State of New
k since its opening in 1854. From 1862 to 1872 I was the
eon-in-chief, with entire medical control and sole responsibility
e treatment of its inmates.

n the beginning the capacity of the hospital did not exceed that
n ordinary sized dwelling. In 1862, and subsequently, through
efforts of Mr. A. R. Wetmore, Vice-President of the Board of
ernors (in whose honor the structure is called the "Wetmore
ilion"), means were secured for erecting a handsome edifice, especially adapted for its purpose. It was built under my personal super-
on, organized by myself, and brought to a high state of prosperity
ore any change was made in its management. In 1872 there were
ed to the medical staff three other gentlemen whose eminence in
ecology is well known. They shared with me the responsibility,
have done much to enlarge the reputation and usefulness of the
itution, which, for several years, was the only hospital of this
ial character in the world. Up to the date of this reorganization
ut three-fourths of all the patients admitted had been under my
e, and I had performed even a larger proportion of the surgical
rations. To the enormous clinical advantages thus available have
n added those of my private hospital, now in operation sixteen
ars, and those of an extensive consulting practice.

I have thought it proper to give this brief account of the clinical
ld from which such a large ortion of the fruits herein presented
ve been gathered, in order to explain the individuality which the
rk may possess. In attempting to ascertain and formulate the laws
hich apply to diseases, and to analyze the results of treatment, I

have compressed numerous histories and facts into a number of statistical tables, which present, in brief space, information that hundreds of pages would scarcely have sufficed to contain in detail. Thei parallel, it is believed, is not to be found in the whole range of gynæcological literature, and if they unfold to others what I have aimed to put in them, I shall feel compensated for the labor they have involved. For two continuous years they kept me occupied in hours not required for professional work, and to the minutest detail they have been prepared by myself, for I felt that their value rested on their accuracy, which I could not have vouched for if their compilation had been committed to others.

In addition to my own experience, I have endeavored to record that of other authors whenever available, aiming always to include what I felt was useful, and to exclude rigorously what I knew to be erroneous in precept or practice, so that the work might faithfully mirror what I conceived to be the true aspect of gynæcology. I will be observed that, with the exception of the two plates taken from Savage's work and some of the instruments, all the illustrations are original, the drawings having been furnished by myself.

If I have omitted to give due credit to any one for priority in, or special contribution to, the elucidation of any subject, it has been through inadvertence, for I would account no man's labor as my own

For obvious reasons I have been silent upon all diseases and conditions not peculiar to women ; and I have not thought it necessary t insert formal prescriptions in the work. No man can prove successfu as a gynæcologist who has not mastered the principles of medicine and stored up experience in the general treatment of disease. The competent practitioner knows that prescriptions must be varied with each case ; to the incompetent, ready-made formulæ are but a snare

From the first page to the last I have cherished the same deep sense of responsibility that every conscientious physician must fee at the bedside of a patient whose life is in his hands ; and in committing this work to my brethren I can truly say that it reflects the best part of a career that has not been idle or lacking in earnestnes of purpose, and I trust, not spent in vain.

89 Madison Avenue, New York.
March, 1879.

CONTENTS.

CHAPTER I.

PAGE
Relations of Climate, Education, and Social Conditions to Development 17

Effects of the American climate upon longevity, nutrition, development, and generation—Early impressions on the nervous system are permanent, and are transmitted to descendants—Causes of imperfect development of young women—Active culture of the brain in the developing period incompatible with the normal growth and function of uterus and ovaries.

CHAPTER II.

struments Used in Examinations 22

Specula; Sims's, Emmet's—Depressor—Tenacula—Sims's copper sound—Emmet's probe—Jenks's spiral sound—Sponge-holder—Long-nozzled syringe—Sims's elevator—Emmet's elevator—Applicator—Case of gynæcological instruments—Sponge tents—Method of preparing them—Emmet's uterine dilator, by sponge and by water—Rules for using sponge tents—Laminaria tents—Tupelo tents—Cornstalk tents.

CHAPTER III.

gical Instruments and Appliances 41

Scissors of various curves—Ball-and-socket knife—Needles—Sims's needle-holder—Emmet's needle forceps—Sims's feeder—Twisting forceps—Sims's shield—Double tenaculum—Sims's blunt hook—Hanks' counter-pressure hook—Silver wire—Mode of freshening surfaces, before the introduction of sutures—Silver sutures, and mode of introduction. Mode of administering vaginal injections of hot water—Foster's vaginal syringe—Vaginal tampon; its use and mode of application.

CHAPTER IV.

Form for a Record of Cases; Mode of Examination; Chief Points for Diagnosis 57

Blank forms for records—Neatness in person and instrument—Examination table—Digital examination; its value; mode of making it; points to be noted—Conjoined examination—Physical signs of a retroverted uterus; of a flexed uterus; of a uterine fibroid—Enlarged uterus; dif-

PAG

ferentiated from pregnancy, and from other bodies, growths, tumors, hemorrhagic collections, etc.—Condition of vagina, urethra, bladder, cervix uteri, perineum, rectum—Dilating the urethra, a reprehensible practice—*Mode of using the speculum*—Points to be noted—Use of probe—Latent cellulitis.

CHAPTER V.

Causes of Disease, Reflex and Direct 7

Influence of ganglionic or sympathetic system of nerves—Faulty nutrition—Uterine congestion and inflammation—Effect of increased weight of the uterus—Influence of the ovaries upon the uterine condition—Subinvolution—Constipation—Influence of fruitfulness and sterility upon growths—Difference between a fibroid and a fibrous tumor—Active exercise renders the uterus less liable to conditions arising from celibacy—Cancer and corroding ulcer—Atrophy of uterine body—*Accidental causes of disease:* 1. Products of inflammation and hemorrhage; 2. Injuries of the cervix and displacements; 3. Injuries of the vagina and its outlet; 4. Results of inflammation of mucous glands of the vagina, uterus, Fallopian tubes, and ovaries.

CHAPTER VI.

Principles of General Treatment . . . .

Confidence of the patient essential to success—Influence of the mind over disease—Anæmia—Method of improving digestion and nutrition—Influence of sunlight—Influence of diet, etc.: coffee, stimulants, anodynes—Habitual invalids—Dress—Hours for meals, etc.—Importance of details.

CHAPTER VII.

Local Treatment 1

The condition of the circulation in the pelvis—Its influence on local disease—Must be corrected before any permanent advance can be made—The effects of electricity, cold and heat in exciting contraction of vessels through reflex action—Hot-water vaginal injections; history and mode of use.

CHAPTER VIII.

Principles of Treatment, Continued; Displacements, Pelvic Circulation, Lining Membrane of the Uterus, Applications to the Uterine Canal . 1

Proper position of the uterus—The essential principle is to remove obstruction to the uterine circulation—Positions either too low or too high are objectionable—Campbell's pneumatic repositor—Chronic inflammation and ulceration do not exist—Remedies: Nitrate of silver—Carbolic acid—Glycerine—Iodine—Use of applicator—Powdered substances—Pith of cornstalk—Sponge tents to reduce size of uterus—Injections of Churchill's tincture of iodine into uterine cavity—Hot water in the uterine cavity—Blisters to the cervix—Hyperæsthesia is not inflammation.

CHAPTER IX.

PAGE

OVULATION AND MENSTRUATION 146

Nerve supply of the ovaries—Puberty—The uterus not the dominant organ of the female—Menstruation not always due to ovulation—Disintegration of the lining membrane of the uterus during menstruation—Causes which determine early or late menstruation—Table I., showing age at first menstruation, for single, sterile, and fruitful women; and whether menstruation was regular or not—Table II., showing the percentage on the whole number menstruating at a given age—Table III., showing the percentage in relation to regularity or irregularity—Table IV., regularity further analyzed—Table V., pain during menstruation, in reference to health, disease, and sterility—Table VI., showing proportion suffering pain with menstruation for each menstrual age—Table VII., showing further relation of pain to menstruation—Table VIII., pain during menstruation for all conditions—Table IX., showing average duration of the flow—Table X., showing duration of flow with reference to circumstances of first menstruation—Table XI., changes in duration of flow in after-life—Table XII., menstrual changes as to quantity and duration.

CHAPTER X.

NORMAL CHANGES IN THE MENSTRUAL FLOW 174

Deviations from the normal standard—Amenorrhœa—Scanty menstruation—Menorrhagia—Membranous dysmenorrhœa—Vicarious menstruation—Hysteria.

CHAPTER XI.

GENITAL ABSENCE AND ACCIDENTAL ATRESIA OF THE VAGINA; MODE OF OPERATING FOR ESTABLISHING THE CANAL, AND EVACUATING RETAINED MENSTRUAL BLOOD 202

Causes of retention—Mode of relief—Table XIII., exhibiting cases of imperforate hymen, congenital absence of uterus, and accidental occlusion—Cause of death when the uterus has been emptied of its contents—Proper mode of treatment—Cases.

CHAPTER XII.

IC HEMATOCELE 235

Definition—History—Applied terms—Source of the blood—Frequency—Symptoms—Varieties—Differential diagnosis—Treatment.

CHAPTER XIII.

DISEASES OF THE PELVIC CELLULAR TISSUE 256

Description of the tissues—Views of different authorities regarding the tissues involved—The influence of cellulitis not fully appreciated as a cause of disease in the uterus and ovaries—Etiology—Tables showing the causes, complications, and location of cellulitis, and the influence of cellulitis on the menstrual flow—Symptoms—Treatment—Dr. Brickell's views.

CHAPTER XIV.

PA

DISPLACEMENTS OF THE UTERUS 2

Anatomical supports of the uterus—Normal position of the uterus—Pelvic roof—Downward displacements, or prolapse—Causes—Versions; forward, backward, lateral—Causes of versions—Flexures.

CHAPTER XV.

ETIOLOGY AND TREATMENT OF UTERINE VERSIONS 2

Tables XVIII. to XXIII. inclusive, showing the relations of versions to menstruation, marriage, celibacy, fruitfulness, sterility, pregnancy, age, pain, etc., also percentages—Treatment of versions.

CHAPTER XVI.

PESSARIES 3

Proper time for their use—Peculiarities to be met—Object of pessaries—Individual forms—Block-tin for modelling—Adjusting pessaries.

CHAPTER XVII.

ETIOLOGY OF UTERINE FLEXURES 3

Tables (XXIV. to XXX.) showing the relations of flexures, general and special, to marriage, celibacy, pregnancy, miscarriage, menstruation, etc. etc.—Anteflexures—Retroflexures—Lateral flexures.

CHAPTER XVIII.

TREATMENT OF FLEXURES OF THE UTERUS 3

Errors in pathology—Intra-uterine stem pessaries—Dilatation—Curved tents—Division of cervix.

CHAPTER XIX.

PROCIDENTIA, OR PROLAPSE OF THE UTERUS 3

Causes—Etiology; Table XXXI., showing the relation of procidentia to age, pregnancy, injury, labor, and other conditions—Treatment, pessaries, surgical measures—Cystocele—Rectocele.

CHAPTER XX.

LACERATION OF THE PERINEUM 3

Effects of laceration—Mode of operating—Jenks's method—Introduction of the sutures and securing the wires—Laceration through the sphincter—Mode of operating—Causes of failure—Table XXXII., showing relation of laceration through the sphincter to age, pregnancies, labors, etc.

CHAPTER XXI.

PAGE

Inversion of the Uterus 410

Causes — Frequency — Symptoms—Diagnosis—Treatment — Method of Valentin, White, Tyler Smith, Noeggerath, Courty, Simpson, Thomas, Barnes, Byrne, Watts, Tate, Dandridge's suggestion, Emmet—By continued moderate pressure—By amputation.

CHAPTER XXII.

b-involution of the Uterus 446

CHAPTER XXIII.

aceration of the Cervix Uteri 448

History— Etiology—Tables XXXIII. to XXXVII. inclusive, being analyses of lacerations—Influence on menstruation.

CHAPTER XXIV.

gnosis and Treatment of Lacerations of the Cervix Uteri . . . 461

CHAPTER XXV.

putation of the Cervix Uteri 484

Never called for except for malignant disease—True elongation of the cervix does not exist—Double laceration often mistaken for elongation—What is the true condition ?—Treatment by the cautery—Intra-uterine stem pessary—Mode of amputating—Cicatricial cervix.

CHAPTER XXVI.

alignant Growths of the Uterus, Vagina, Rectum, and External Organs of Generation 493

Definition—Varieties—Etiology—Rare among Negroes—More common among the richer than among the poorer classes—Tables XXXVIII. and XXXIX.—Prognosis, Diagnosis, and Treatment—Sarcoma—Corroding ulcer—Cancer of external organs of generation and rectum.

CHAPTER XXVII.

scription, Etiology, and Diagnosis of Fibrous Growths of the Uterus . 518

Mode of formation—Etiology—Tables XL. to LII. inclusive—Diagnosis.

CHAPTER XXVIII.

Local and General Treatment of Fibrous Growths of the Uterus . . 550

Action of ergot, opium, alum, gallic acid, cinnamon—Incision of tumor—Enucleation—Partial removal—Disintegration—Tapping a fibro-cyst.

CHAPTER XXIX.

PAG

SURGICAL TREATMENT OF FIBROUS GROWTHS OF THE UTERUS 56

Pedunculated fibroids—Polypi—Écraseur—Removal by traction—By Thomas's serrated scoop—Removal of the ovaries for profuse hemorrhage from fibrous tumors.

CHAPTER XXX.

DISEASES OF THE EXTERNAL ORGANS OF GENERATION, CERVIX, AND UTERINE CANAL 59

Elephantiasis and hypertrophy of labia and clitoris—Fibrous and fatty tumors—Oozing tumor—Labial cysts—Vaginismus—Vaginitis—Disease of the cervix and uterine canal.

CHAPTER XXXI.

VESICO- AND RECTO-VAGINAL FISTULA 6

History and development of the operation—Silver sutures—Button suture—Preparatory treatment—Mode of operating.

CHAPTER XXXII.

DIFFERENT FORMS OF FISTULÆ 6

Vesico-vaginal—Urethro-vaginal—Congenital absence of the urethra—Uretero-vaginal—Recto-vaginal.

CHAPTER XXXIII.

STATISTICAL HISTORY OF VESICO- AND RECTO-VAGINAL FISTULA . . .

CHAPTER XXXIV.

DISEASES OF THE URETHRA . . . .

CHAPTER XXXV.

CYSTITIS. STONE IN THE BLADDER AND URETERS . . . .

CHAPTER XXXVI.

DISEASES OF THE OVARIES . . . .

Oöphoritis—Enlargement—Treatment—Battey's operation.

CHAPTER XXXVII.

TUMORS OF THE OVARY . . . .

Solid (fibrous) tumors—Cystic tumors; follicular cysts; compound cystomata; myxoid and dermoid cystomata; cystoma proliferum papillare; C. parviloculare; C. sarcomatosum (cystosarcoma); C. myxomatosum—Retrograde metamorphosis of cystomata; fatty, sclerotic, atrophic, hemorrhagic, purulent, spontaneous perforation—Development of cystomata.

CHAPTER XXXVIII.

PAGE

Cystic Tumors of the Ovary (Continued) 786

Unilocular cysts (monocystic, oligocystic)—Multilocular cysts (compound, proligerous, polycystic)—Stages—Rapidity of development—Symptoms—Diagnosis.

CHAPTER XXXIX.

dominal Tumors 795

Contents of abdominal tumors and ascitic fluid considered in relation to diagnosis.

CHAPTER XL.

atment of Ovarian Cystic Tumors 805

Internal remedies—Surgical treatment; tapping; injection of iodine; drainage; vaginal ovariotomy; abdominal ovariotomy.

CHAPTER XLI.

ditions which may Complicate the Operation of Ovariotomy . . . 816

Inflammation of the sac—Peritonitis and ascites—Adhesions—Size and long existence of the tumor—Pregnancy—Cancer—Phthisis—Renal disease—Uterine fibrous tumors—Disease of the other ovary.

CHAPTER XLII.

neral Details in Ovariotomy 831

Proper time for operating—Preparatory treatment—Instruments—Preparations for the operation—Mode of treating the pedicle.

CHAPTER XLIII.

dominal Ovariotomy 847

Steps of the operation—After-treatment; antiseptic dressings; closing of the incision; reduction of temperature (quinine, cold water applications, "fever cot").

their high professional standing.

I.

THE AMERICAN JOURNAL OF THE MEDICAL SCIENC

EDITED BY I. MINIS HAYS, M.D.,

for more than half a century has maintained its position in the front rank medical literature of the world. Cordially supported by the profession of Am it circulates wherever the language is read, and is universally regarded as a na exponent of American medicine—a position to which it is entitled by the d guished names from every section of the Union which are to be found amo collaborators.* It is issued quarterly, in January, April, July, and October, number containing about three hundred octavo pages, appropriately illust wherever necessary. A large portion of this space is devoted to Original Co nications, embracing papers from the most eminent members of the pro throughout the country.

Following this is the REVIEW DEPARTMENT, containing extended reviews b petent writers of prominent new works and topics of the day, together with ous elaborate Analytical and Bibliographical Notices, giving a fairly compl vey of medical literature.

Then follows the QUARTERLY SUMMARY OF IMPROVEMENTS AND DISCOVE THE MEDICAL SCIENCES, classified and arranged under different heads, and f ing a digest of medical progress, abroad and at home.

Thus during the year 1878 the "JOURNAL" contained 77 Original Com tions, mostly elaborate in character, 133 Reviews and Bibliographical Noti 255 articles in the Quarterly Summaries, illustrated with 48 maps and e gravings.

That the efforts thus made to maintain the high reputation of the "JOUR successful, is shown by the position accorded to it in both America and Eur leading organ of medical progress:—

This is universally acknowledged as the leading American Journal, and has been conducted by Dr. Hays alone until 1869, when his son was associated with him. We quite agree with the critic, that this journal is second to none in the language, and cheerfully accord to it the first place, for nowhere shall we find more able and more impartial criticism, and nowhere such a repertory of able original articles. Indeed, now that the "British and Foreign Medico-Chirurgical Review" has terminated its career, the American Journal stands without a rival.—*London Med. Times and Gazette*, Nov. 24, 1877.

The best medical journal on the continent.—*Boston Med and Surg. Journal*, April 17, 1879.

The present number of the American Journal is an exceedingly good one, and gives every promise of maintaining the well-earned reputation of the review Our venerable contemporary has our best wishes, and we can only express the hope that it may continue its work with as much vigor and excellence for the next fifty years as it has exhibited in the past. —*London Lancet*, Nov. 24, 1877.

The Philadelphia Medical and Physic issued its first number in 1820, and, after career, was succeeded in 1827 by the Journal of the Medical Sciences, a pe world-wide reputation; the ablest and oldest periodicals in the world—a journal an unsullied record.—*Gross's History of Med. Literature*, 1876.

It is universally acknowledged to be th American medical journal, and, in our second to none in the language.—*Boston Surg. Journal*, Oct. 1877.

This is the medical journal of our countr the American physician abroad will point greatest satisfaction, as reflecting the state culture in his country. For a great ma has been the medium through which our ers have made known their discoveries a tions —*Address of L. P. Yandell, M.D.,* *national Med. Congress*, Sept. 1876.

And that it was specifically included in the award of a medal of merit to the P in the Vienna Exhibition in 1873.

The subscription price of the "AMERICAN JOURNAL OF THE MEDICAL SCIENC never been raised during its long career. It is still FIVE DOLLARS per annu when paid for in advance, the subscriber receives in addition the "MEDICAL NE ABSTRACT," making in all nearly 2000 large octavo pages per annum, free of p

II.

THE MEDICAL NEWS AND ABSTRACT.

Thirty-seven years ago the "MEDICAL NEWS" was commenced as a mo convey to the subscribers of the "AMERICAN JOURNAL" the clinical instructi nt information which could not be accommodated in the Quarterly. It con- of sixteen pages of such matter, together with sixteen more known as the y Department and devoted to the publishing of books. With the increased of science, however, this was found insufficient, and some years since an- periodical. known as the "Monthly Abstract," was started, and was fur- at a moderate price to subscribers to the "American Journal." These nthlies will hereafter be consolidated, under the title of "The Medical and Abstract," and will be furnished *free of charge* in connection with the ican Journal."

---

* Communications are invited from gentlemen in all parts of the country. Elaborate articles by the Editor are paid for by the Publishers.

"News and Abstract" will consist of 64 pages monthly, in a neat cover. contain a Clinical Department in which will be continued the series of l American Clinical Lectures, by gentlemen of the highest reputation out the United States, together with a choice selection of foreign Lectures pi al Notes and Gleanings. Then will follow the Monthly Abstract, sys- lly arranged and classified, and presenting five or six hundred articles yearly; h number will conclude with a News Department, giving current profes- telligence, domestic and foreign, the whole fully indexed at the close of me, rendering it of permanent value for reference.

ted above, the subscription price to the "News and Abstract" will be lars and a Half per annum, invariably in advance, at which rate it will rank the cheapest medical periodicals in the country. But it will also be fur- e of all charge, in commutation with the "American Journal of the Sciences," to all who remit Five Dollars in advance, thus giving to the r, for that very moderate sum, a complete record of medical progress t the world, in the compass of about two thousand large octavo pages. effort to furnish so large an amount of practical information at a price so ntedly low, and thus place it within the reach of every member of the , the publishers confidently anticipate the friendly aid of all who feel an the dissemination of sound medical literature. They trust, especially, that bers to the "American Medical Journal" will call the attention of their ces to the advantages thus offered, and that they will be sustained in the to permanently establish medical periodical literature on a footing of never heretofore attempted.

UM FOR OBTAINING NEW SUBSCRIBERS TO THE "JOURNAL."

tleman who will remit the amount for two subscriptions for 1880, one of ast must be for a *new subscriber*, will receive as a premium, free by mail, a y one of the following recent works:

a's Manual of Midwifery" (see p. 24),
ry Fox's Epitome of Diseases of the Skin," new edition, just ready, (see p. 18).
ergill's Antagonism of Medicines" (see p. 16),
den's Landmarks, Medical and Surgical" (see p. 6),
e on the Use of the Ophthalmoscope" (see p. 29),
t's Essays on Conservative Medicine" (see p. 15),
ges's Clinical Medicine" (see p. 14),
yne's Obstetric Aphorisms," new edition (see p. 21),
er's Clinical Manual" (see p. 5),
t on Nervous Disorders of Children" (see p. 20).

DUNGLISON (ROBLEY), M.D.,

Late Professor of Institutes of Medicine in Jefferson Medical College, Philadelphia.

MEDICAL LEXICON; A DICTIONARY OF MEDICAL SCIENCE:
taining a concise explanation of the various Subjects and Terms of Anatomy, Phy
Pathology, Hygiene, Therapeutics, Pharmacology, Pharmacy, Surgery, Obstetrics,
Jurisprudence, and Dentistry. Notices of Climate and of Mineral Waters; Form
Officinal, Empirical, and Dietetic Preparations; with the Accentuation and Etym
the Terms, and the French and other Synonymes; so as to constitute a French as
English Medical Lexicon. A New Edition. Thoroughly Revised, and very greatly
ified and Augmented. By RICHARD J. DUNGLISON, M.D. In one very large and
some royal octavo volume of over 1100 pages. Cloth, $6 50; leather, raised bands,
(*Just Issued.*)

The object of the author from the outset has not been to make the work a mere lex
dictionary of terms, but to afford, under each, a condensed view of its various medical re
and thus to render the work an epitome of the existing condition of medical science. S
with this view, the immense demand which has existed for the work has enabled him, in r
revisions, to augment its completeness and usefulness, until at length it has attained the
of a recognized and standard authority wherever the language is spoken.

Special pains have been taken in the preparation of the present edition to maintain
viable reputation. During the ten years which have elapsed since the last revision, the
to the nomenclature of the medical sciences have been greater than perhaps in any simila
of the past, and up to the time of his death the author labored assiduously to incorporat
thing requiring the attention of the student or practitioner. Since then, the editor
equally industrious, so that the additions to the vocabulary are more numerous than in
vious revision. Especial attention has been bestowed on the accentuation, which will
marked on every word. The typographical arrangement has been much improved, re
reference much more easy, and every care has been taken with the mechanical executi
work has been printed on new type, small but exceedingly clear, with an enlarged pag
the additions have been incorporated with an increase of but little over a hundred p
the volume now contains the matter of at least four ordinary octavos.

A book well known to our readers, and of which every American ought to be proud. When the learned author of the work passed away, probably all of us feared lest the book should not maintain its place in the advancing science whose terms it defines. Fortunately, Dr. Richard J. Dunglison, having assisted his father in the revision of several editions of the work, and having been, therefore, trained in the methods and imbued with the spirit of the book, has been able to edit it, not in the patchwork manner so dear to the heart of book editors, so repulsive to the taste of intelligent book readers, but to edit it as a work of the kind should be edited—to carry it on steadily, without jar or interruption, along the grooves of thought it has travelled during its lifetime. To show the magnitude of the task which Dr Dunglison has assumed and carried through, it is only necessary to state that more than six thousand new subjects have been added in the present edition.—*Phila. Med. Times*, Jan. 3, 1874.

About the first book purchased by the medical student is the Medical Dictionary. The lexicon explanatory of technical terms is simply a *sine qua non*. In a science so extensive, and with such collaterals as medicine, it is as much a necessity also to the practising physician. To meet the wants of students and most physicians, the dictionary must be condensed while comprehensive, and practical while perspicacious. It was because Dunglison's met these indications that it became at once the dictionary of general use wherever medicine was studied in the English language. In no former revision have the alterations and additions been so great. More than six thousand new subjects and terms have been added. The chief terms have been set in black letter, while the derivatives follow in small caps; an arrangement which greatly facilitates reference. We
may safely confirm the hope ventured by
"that the work, which possesses for him a
as an individual interest, will be found w
tinuance of the position so long accorded
standard authority."—*Cincinnati Clinic*. J

It has the rare merit that it certainly
in the English language for accuracy a
references.—*London Medical Gazette*

As a standard work of reference, as one
if not the very best, medical dictionary i
lish language, Dunglison's work has been
for about forty years, and needs no wor
on our part to recommend it to the mem
medical, and, likewise, of the pharma
fession. The latter especially are in nee
work, which gives ready and reliable i
on thousands of subjects and terms whi
liable to encounter in pursuing their d
tions, but with which they cannot be exp
familiar. The work before us fully
want.—*Am. Journ. of Pharm.*, Feb. 1874.

A valuable dictionary of the terms
medicine and the allied sciences, and
tions of the subjects treated under each
flects great credit on its able America
well deserves the authority and popula
obtained.—*British Med. Journ.*, Oct. 31,

Few works of this class exhibit a gra
ment of patient research and of scientific
extent of the sale of this lexicon is suffi
tify to its usefulness, and to the great
ferred by Dr. Robley Dunglison on the
and indeed on others, by its issue.—*Lond*
May 13 1875.

HOBLYN (RICHARD D.), M.D

A DICTIONARY OF THE TERMS USED IN MEDICINE
THE COLLATERAL SCIENCES. Revised, with numerous additions, by ISAAC
M.D., Editor of the "American Journal of the Medical Sciences." In one la
12mo. volume of over 500 double-columned pages; cloth, $1 50; leather, $2

It is the best book of definitions we have, and ought always to be upon the student's table.—
Med. and Surg Journal.

RODWELL (G. F.), F.R.A.S., &c.

A DICTIONARY OF SCIENCE: Comprising Astronomy,
istry, Dynamics, Electricity, Heat, Hydrodynamics, Hydrostatics, Light, Ma
Mechanics, Meteorology, Pneumatics, Sound, and Statics. Preceded by an Essay
History of the Physical Sciences. In one handsome octavo volume of 694 pa
many illustrations: cloth, $5.

CENTURY OF AMERICAN MEDICINE, 1776–1876. By Doctors E. H. Clarke, H. J. Bigelow, S. D. Gross, T. G. Thomas, and J. S. Billings. In one very handsome 12mo. volume of about 350 pages: cloth, $2 25. (*Just Ready.*)

is work appeared in the pages of the American Journal of the Medical Sciences during the 1876. As a detailed account of the development of medical science in America, by gentle- f the highest authority in their respective departments, the profession will no doubt wel- it in a form adapted for preservation and reference.

ILL (JOHN), M.D., and SMITH (FRANCIS G.), M.D.,

Prof. of the Institutes of Medicine in the Univ. of Penna.

N ANALYTICAL COMPENDIUM OF THE VARIOUS BRANCHES OF MEDICAL SCIENCE; for the Use and Examination of Students. A new edition, revised and improved. In one very large and handsomely printed royal 12mo. volume, of about one thousand pages, with 374 wood-cuts, cloth, $4; strongly bound in eather, with raised bands, $4 75.

RTSHORNE (HENRY), M.D.,

Professor of Hygiene in the University of Pennsylvania.

CONSPECTUS OF THE MEDICAL SCIENCES; containing Handbooks on Anatomy, Physiology, Chemistry, Materia Medica, Practical Medicine, urgery, and Obstetrics. Second Edition, thoroughly revised and improved. In one large yal 12mo. volume of more than 1000 closely printed pages, with 477 illustrations on ood. Cloth, $4 25; leather, $5 00. (*Lately Issued.*)

n say with the strictest truth that it is the k of the kind with which we are acquainted. ies in a condensed form all recent contribu- ractical medicine, and is therefore useful busy practitioner throughout our country, eing admirably adapted to the use of stu- medicine. The book is faithfully and ably —*Charleston Med. Journ.*, April, 1875.

ork is intended as an aid to the medical , and as such appears to admirably fulfil its y its excellent arrangement, the full compi- facts, the perspicuity and terseness of lan- nd the clear and instructive illustrations parts of the work.—*American Journ. of* y, Philadelphia, July, 1874.

lume will be found useful, not only to stu- t to many others who may desire to refresh mories with the smallest possible expendi- ime.—*N. Y. Med. Journal*, Sept. 1874.

dent will find this the most convenient and ook of the kind on which he can lay his *Pacific Med. and Surg. Journ.*, Aug. 1874.

s the best book of its kind that we have ever d. It is an honest, accurate, and concise of medical sciences, as fairly as possible ting their present condition. The changes additions have been so judicious and tho- to render it, so far as it goes, entirely trustworthy. If students must have a conspectus, they will be wise to procure that of Dr Hartshorne.—*Detroit Rev. of Med and Pharm.*, Aug. 1874.

The work before us, however, has many redeeming features not possessed by others, and is the best we have seen. Dr. Hartshorne exhibits much skill in condensation It is well adapted to the physician in active practice, who can give but limited time to the familiarizing of himself with the important changes which have been made since he attended lectures. The manual of physiology has also been improved and gives the most comprehensive view of the latest advances in the science possible in the space devoted to the subject. The mechanical execution of the book leaves nothing to be wished for.—*Peninsular Journal of Medicine*, Sept 1874.

After carefully looking through this conspectus, we are constrained to say that it is the most complete work, especially in its illustrations, of its kind that we have seen —*Cincinnati Lancet*, Sept. 1874.

The favor with which the first edition of this Compendium was received, was an evidence of its various excellences. The present edition bears evidence of a careful and thorough revision. Dr. Hartshorne possesses a happy faculty of seizing upon the salient points of each subject, and of presenting them in a concise and yet perspicuous manner.—*Leavenworth Med. Herald*, Oct. 1874

LOW (J. L.), M.D.

MANUAL OF EXAMINATIONS upon Anatomy, Physiology, urgery, Practice of Medicine, Obstetrics, Materia Medica, Chemistry, Pharmacy, and herapeutics. To which is added a Medical Formulary. Third edition, thoroughly revised nd greatly extended and enlarged. With 370 illustrations. In one handsome royal 12mo. volume of 816 large pages, cloth, $3 25; leather, $3 75.

arrangement of this volume in the form of question and answer renders it especially suit- r the office examination of students, and for those preparing for graduation.

NNER (THOMAS HAWKES), M.D., &c.

MANUAL OF CLINICAL MEDICINE AND PHYSICAL DIAGNOSIS. Third American from the Second London Edition. Revised and Enlarged by TILBURY FOX, M. D., Physician to the Skin Department in University College Hospital, &c. In one neat volume small 12mo., of about 375 pages, cloth, $1 50.

* On page 3, it will be seen that this work is offered as a premium for procuring new ibers to the "AMERICAN JOURNAL OF THE MEDICAL SCIENCES."

GRAY (HENRY), F.R.S.,

Lecturer on Anatomy at St. George's Hospital, London.

ANATOMY, DESCRIPTIVE AND SURGICAL. The Drawings H. V. CARTER, M.D., and Dr. WESTMACOTT. The Dissections jointly by the AUTHOR Dr. CARTER. With an Introduction on General Anatomy and Development by HOLMES, M.A., Surgeon to St. George's Hospital. A new American, from the eig enlarged and improved London edition. To which is added "LANDMARKS, MEDICAL A SURGICAL," by LUTHER HOLDEN, F.R.C.S., author of "Human Osteology," "A Man of Dissections," etc. In one magnificent imperial octavo volume of 983 pages. w 522 large and elaborate engravings on wood. Cloth, $6; leather, raised bands, (*Just Ready.*)

The author has endeavored in this work to cover a more extended range of subjects than is tomary in the ordinary text-books, by giving not only the details necessary for the student, also the application of those details in the practice of medicine and surgery, thus rendering it a guide for the learner, and an admirable work of reference for the active practitioner. Th gravings form a special feature in the work, many of them being the size of nature, near original, and having the names of the various parts printed on the body of the cut, in pla figures of reference, with descriptions at the foot. They thus form a complete and splendid s which will greatly assist the student in obtaining a clear idea of Anatomy, and will also ser refresh the memory of those who may find in the exigencies of practice the necessity of rec the details of the dissecting room; while combining, as it does, a complete Atlas of Anatomy, a thorough treatise on systematic, descriptive, and applied Anatomy, the work will be fou essential use to all physicians who receive students in their offices, relieving both preceptor pupil of much labor in laying the groundwork of a thorough medical education.

Since the appearance of the last American Edition, the work has received three revisions a hands of its accomplished editor, Mr. Holmes, who has sedulously introduced whatever has se requisite to maintain its reputation as a complete and authoritative standard text-book and of reference. Still further to increase its usefulness, there has been appended to it the re work by the distinguished anatomist, Mr. Luther Holden—"Landmarks, Medical and Sur —which gives in a clear, condensed, and systematic way, all the information by which the titioner can determine from the external surface of the body the position of internal parts. complete, the work, it is believed, will furnish all the assistance that can be rendered by ty illustration in anatomical study. No pains have been spared in the typographical execut the volume, which will be found in all respects superior to former issues. Notwithstandi increase of size, amounting to over 100 pages and 57 illustrations, it will be kept, as here at a price rendering it one of the cheapest works ever offered to the American profession.

The recent work of Mr. Holden, which was noticed by us on p. 53 of this volume, has been added as an appendix, so that, altogether, this is the most practical and complete anatomical treatise available to American students and physicians. The former finds in it the necessary guide in making dissections; a very comprehensive chapter on minute anatomy; and about all that can be taught him on general and special anatomy; while the latter, in its treatment of each region from a surgical point of view, and in the valuable edition of Mr Holden, will find all that will be essential to him in his practice.—*New Remedies*, Aug. 1878.

This work is as near perfection as one could possibly or reasonably expect any book intended as a text-book or a general reference book on anatomy to be. The American publisher deserves the thanks of the profession for appending the recent work of Mr. Holden, "*Landmarks, Medical and Surgical*," which has already been commended as a separate book. The latter work—treating of topographical anatomy—has become an essential to the library of every intelligent practitioner. We know of no book that can take its place, written as it is by a most distinguished anatomist. It would be simply a waste of words to say anything further in praise of Gray's Anatomy, the text-book in almost every medical college in this country, and the daily reference book of every practitioner who has occasion to consult his books on anatomy. The w simply indispensable especially this present ican edition.—*Va. Med. Monthly*, Sept. 1878.

The addition of the recent work of Mr. H as an appendix, renders this the most practi complete treatise available to American st who find in it a comprehensive chapter on anatomy, about all that can be taught on g and special anatomy, while its treatment o region, from a surgical point of view, in the able section by Mr Holden, is all that will be tial to them in practice.—*Ohio Medical Re* Aug 1878.

It is difficult to speak in moderate terms new edition of "Gray." It seems to be as perfect as it is possible to make a book dev any branch of medical science. The labors eminent men who have successively revi eight editions through which it has passed, seem to leave nothing for future editors to do. addition of Holden's "Landmarks" will mak indispensable to the practitioner of medic surgery as it has been heretofore to the stude regards completeness, ease of reference, u beauty, and cheapness, it has no rival. N dent should enter a medical school without physician can afford to have it absent from library.—*St. Louis Clin. Record*, Sept. 1878.

PRACTICAL ANATOMY: A Manual of Dissections. From Second revised and improved London edition. Edited, with additions, by W. W. K M. D., Lecturer on Pathological Anatomy in the Jefferson Medical College, Philadel In one handsome royal 12mo. volume of 578 pages, with 247 illustrations. Cloth, $ leather, $4 00.

LLEN (*HARRISON*), *M.D.*
Professor of Physiology in the Univ. of Pa.

SYSTEM OF HUMAN ANATOMY: INCLUDING ITS MEDICAL and Surgical Relations. For the Use of Practitioners and Students of Medicine. With an Introductory Chapter on Histology. By E. O. SHAKESPEARE, M D , Ophthalmologist to the Phila. Hosp. In one large and handsome quarto volume, with several hundred original illustrations on lithographic plates, and numerous wood-cuts in the text. (*Preparing.*)

his elaborate work, which has been in active preparation for several years, the author has to give, not only the details of descriptive anatomy in a clear and condensed form, but also actical applications of the science to medicine and surgery. The work thus has claims upon tention of the general practitioner, as well as of the student, enabling him not only to re-his recollections of the dissecting room, but also to recognize the significance of all varia-from normal conditions. The marked utility of the object thus sought by the author is ident, and his long experience and assiduous devotion to its thorough development are a nt guarantee of the manner in which his aims have been carried out. No pains have been with the illustrations. Those of normal anatomy are from original dissections, drawn on y Mr. Hermann Faber, with the name of every part clearly engraved upon the figure, manner of "Holden" and "Gray," and in every typographical detail it will be the f the publisher to render the volume worthy of the very distinguished position which is ted for it.

LIS (*GEORGE VINER*),
Emeritus Professor of Anatomy in University College, London.

MONSTRATIONS OF ANATOMY; Being a Guide to the Knowledge of the Human Body by Dissection. By GEORGE VINER ELLIS, Emeritus Professor of Anatomy in University College, London. From the Eighth and Revised London dition. In one very handsome octavo volume of over 700 pages, with 256 illustrations. loth, $4.25 ; leather, $5.25. (*Just Ready.*)

ork has long been known in England as the leading authority on practical anatomy, avorite guide in the dissecting-room, as is attested by the numerous editions through has passed. In the last revision, which has just appeared in London, the accomplished s sought to bring it on a level with the most recent advances of science by making the y changes in his account of the microscopic structure of the different organs, as devel-the latest researches in textural anatomy.

Demonstrations is the favorite text-book nglish student of anatomy. In passing ight editions it has been so revised and to the needs of the student hat it would t it had almost reached perfection in this e. The descriptions are clear, and the f pursuing anatomical investigations are h such detail that the book is honestly to its name.—*St. Louis Clinical Record*, 9.

ccess of this old manual seems to be as well in the present as in the past volumes. t seems destined to maintain yet for years its leadership over the English manuals upon dissecting.—*Phila. Med. Times*, May 24, 1879.

As a dissector, or a work to have in hand and studied while one is engaged in dissecting, we regard it as the very best work extant, which is certainly saying a very great deal. As a text-book to be studied in the dissecting-room, it is superior to any of the works upon anatomy.—*Cincinnati Med. News*, May 24, 1879.

We most unreservedly recommend it to every practitioner of medicine who can possibly get it.—*Va. Med. Monthly*, June, 1879.

CARPENTER (WILLIAM B.), M. D., F. R. S., F.G.S., F.L.S.,
Registrar to University of London, etc.

PRINCIPLES OF HUMAN PHYSIOLOGY; Edited by HENRY POWER,

M.B. Lond., F R.C.S., Examiner in Natural Sciences, University of Oxford. A new American from the Eighth Revised and Enlarged English Edition, with Notes and Additions, by FRANCIS G. SMITH, M.D., Professor of the Institutes of Medicine in the University of Pennsylvania, etc. In one very large and handsome octavo volume, of 1083 pages with two plates and 373 engravings on wood; cloth, $5 50; leather, $6 50. (*Just Issued.*)

We have been agreeably surprised to find the volume so complete in regard to the structure and functions of the nervous system in all its relations, a subject that, in many respects, is one of the most difficult of all, in the whole range of physiology, upon which to produce a full and satisfactory treatise of the class to which the one before us belongs. The additions by the American editor give to the work as it is a considerable value beyond that of the last English edition. In conclusion, we can give our cordial recommendation to the work as it now appears The editors have, with their additions to the only work on physiology in our language that, in the fullest sense of the word, is the production of a philosopher as well as a physiologist, brought it up as fully as could be expected, if not desired, to the standard of our knowledge of its subject at the present day It will deservedly maintain the place it has always had in the favor of the medical profession.—*Journ. of Nervous and Mental Disease*, April, 1877.

Such enormous advances have recently been made in our physiological knowledge, that what was perfectly new a year or two ago. looks now as if it had been a received and established fact for years. In this encyclopædic way it is unrivalled. Here, as it seems to us, is the great value of the book; one is safe in sending a student to it for information on almost any given subject, perfectly certain of the fulness of information it will convey, and well satisfied of the accuracy with which it will there be found stated.—*London Med Times and Gazette*, Feb. 17, 1877.

The merits of "Carpenter's Physiology" are so widely known and appreciated that we need only allude briefly to the fact that in the latest edition will be found a comprehensive embodiment of the results of recent physiological investigation. Care has been taken to preserve the practical character of the original work. In fact the entire work has been brought up to date, and bears evidence of the amount of labor that has been bestowed upon it by its distinguished editor, Mr. Henry Power The American editor has made the latest additions, in order fully to cover the time that has elapsed since the last English edition.—*N. Y. Med. Journal*, Jan. 1877.

FOSTER (MICHAEL), M.D., F.R.S.,
Prof. of Physiology in Cambridge Univ., England.

TEXT-BOOK OF PHYSIOLOGY. A new American, from the third

English edition. Edited with notes and additions by EDWARD T. REICHERT, M.D., Demonstrator of Experimental Therapeutics in Univ. of Penna. In one handsome royal 12mo. volume of over 1000 pages, with over 250 illustrations. Cloth, $2 50. Leather, $3 25. (*Just Ready.*)

AMERICAN EDITOR'S PREFACE.

The high reputation acquired on both sides of the Atlantic by Dr. Foster's "Text-Book on Physiology," as a lucid exposition of functional physiology, in its most modern aspect, has seemed to call for an edition more thoroughly adapted to the wants of the American student. The plan of the author has presupposed an acquaintance with the details of physiological anatomy such as the student is accustomed to look to in his treatises on physiology. The absence of these details has rendered many parts of the work vague, if not altogether incomprehensible, and has therefore proved a serious drawback to the usefulness of the book as an accompaniment to lectures on physiology, as it is usually taught in our schools, and this deficiency the editor has endeavored to supply, by brief notes and the introduction of a large number of illustrations.

The almost limitless amount of material accumulated by modern research has rendered difficult the task of selection and compression, without exceeding the reasonable limits of a convenient text-book. In his selection the editor has been guided by his experience in the wants of students, and has endeavored merely to present, in the most concise form, such facts as would seem to be indispensable to a correct appreciation of the structure and function of the important organs. In accomplishing this, his additions have considerably exceeded his expectations, amounting to about 140 pages, including the illustrations which have been increased in number from 72 to 259. If he shall thus have succeeded in rendering this admirable work better fitted for the wants of the American student, he will feel abundantly rewarded.

Nothing has been omitted from the English edition, and all additions have been distinguished by insertions in brackets [—].

On the whole the book can be called the standard work in the English language, while it has none superior in any other tongue. It is, perhaps, the only work in our language which represents physiology fully as an experimental science. Its completeness is admirable. The anxious student can find not only the actual facts of the science, but also the mode in which they were obtained. The author proves to the student not only a compiler but a judicious critic.—*Journ. of Nervous and Mental Diseases*, Jan 1880.

The work, since its first appearance, has continued to be one of the most satisfactory text-books on the subject that we have met with, and is in many respects peculiarly adapted to the use of practitioners. Those whose knowledge of the functions of organs was chiefly acquired a decade ago, and who have not since been diligent students of the subject, can little appreciate what advances have been made, and can do nothing better than to give Dr. Foster's work some careful reading —*New Remedies*, Jan. 1880.

The author of this book is too well known to physiologists to require an introduction. His contributions to this branch of science have secured for him lasting fame. As an advanced thinker and writer his views and teaching are regarded as the highest authority, and may be accepted as the latest outcome of physiological research and study—*Maryland Med. Journal*, Feb. 1880.

An elaborate review at present is not required; it is only necessary to say that it is the best book of its immediate scope in any of the three languages, so far, at least, as our knowledge goes.—*Philada. Med. Times*, Jan. 3, 1880.

HARTSHORNE'S HANDBOOK OF ANATOMY AND PHYSIOLOGY. Second edition, revised. In one royal 12mo. vol., with 220 wood-cuts; cloth, $1 75.

LEHMANN'S PHYSIOLOGICAL CHEMISTRY. Complete in two large octavo volumes of 1200 pages, with 200 illustrations; cloth, $6.

ALTON (J. C.), M.D.,
Professor of Physiology in the College of Physicians and Surgeons, New York, &c.

A TREATISE ON HUMAN PHYSIOLOGY. Designed for the use of Students and Practitioners of Medicine. Sixth edition, thoroughly revised and enlarged, with three hundred and sixteen illustrations on wood. In one very beautiful octavo volume, of over 800 pages. Cloth, $5 50; leather, $6 50. (*Just Issued.*)

ring the past few years several new works on phy- y, and new editions of old works, have appeared, ing for the favor of the medical student, but will rival this new edition of Dalton. As now en- , it will be found also to be, in general, a satisfac- ork of reference for the practitioner.—*Chicago ourn. and Examiner*, Jan. 1876.

Dalton has discussed conflicting theories and ions regarding physiological questions with a s, a fulness, and a conciseness which lend fresh- d vigor to the entire book. But his discussions en so guarded by a refusal of admission to those tive and theoretical explanations, which at best the minds of observers themselves as only pro- s, that none of his readers need be led into rrors while making them a study.—*The Medical* , Feb. 19, 1876.

vision of this great work has brought it forward physiological advances of the day, and renders has ever been, the finest work for students ex- *ashville Journ. of Med. and Surg.*, Jan. 1876.

earness and perspicuity, Dalton's Physiology ded itself to the student years ago, and was a relief from the verbose productions which it ed. Physiology has, however, made many ad- nce then—and while the style has been pre- ct, the work in the present edition has been fully abreast of the times. The new chemical d nomenclature have also been introduced esent edition. Notwithstanding the multi- xt-books on physiology, this will lose none time popularity. The mechanical execution rk is all that could be desired.—*Peninsular of Medicine*, Dec. 1875.

This popular text-book on physiology comes to us in its sixth edition with the addition of about fifty per cent. of new matter, chiefly in the departments of pathological chemistry and the nervous system, where the principal advances have been realized. With so thorough revision and additions, that keep the work well up to the times, its continued popularity may be confidently predicted, notwithstanding the competition it may encounter. The publisher's work is admirably done.—*St. Louis Med. and Surg. Journ.*, Dec. 1875.

We heartily welcome this, the sixth edition of this admirable text book, than which there are none of equal brevity more valuable. It is cordially recommended by the Professor of Physiology in the University of Louisiana, as by all competent teachers in the United States, and wherever the English language is read, this book has been appreciated. The present edition, with its 316 admirably executed illustrations, has been carefully revised and very much enlarged, although its bulk does not seem perceptibly increased.—*New Orleans Medical and Surgical Journal*, March, 1876.

The present edition is very much superior to every other, not only in that it brings the subject up to the times, but that it does so more fully and satisfactorily than any previous edition. Take it altogether it remains in our humble opinion, the best text-book on physiology in any land or language.—*The Clinic*, Nov. 6, 1875.

As a whole, we cordially recommend the work as a text-book for the student, and as one of the best.—*The Journal of Nervous and Mental Disease*, Jan. 1876.

Still holds its position as a masterpiece of lucid writing, and is, we believe, on the whole, the best book to place in the hands of the student.—*London Students' Journal.*

EENE (WILLIAM H.), M.D.,
Demonstrator of Chemistry in Med. Dept., Univ. of Penna.

ANUAL OF MEDICAL CHEMISTRY. For the Use of Students. ased upon Bowman's Medical Chemistry. In one royal 12mo. volume of 312 pages. ith illustrations. Cloth, $1 75. (*Just Ready.*)

SSEN (ALEXANDER),
Professor in the Royal Polytechnic School, Aix la-Chapelle.

EMENTARY QUANTITATIVE ANALYSIS. Translated with otes and additions by EDGAR F. SMITH, Ph.D., Assistant Prof. of Chemistry in the owne Scientific School, Univ. of Penna. In one handsome royal 12mo. volume, of 324 ges, with illustrations; cloth, $2 00. (*Just Ready.*)

obably the best manual of an elementary ent, insomuch as its methods are the best. by examples, commencing with single tions, followed by separations, and then advancing to the analysis of minerals and such products as are met with in applied chemistry. It is an indispensable book for students in chemistry.—*Boston Journ. of Chemistry*, Oct. 1878.

LOWAY (ROBERT), F.C.S.,
Prof of Applied Chemistry in the Royal College of Science for Ireland, etc.

ANUAL OF QUALITATIVE ANALYSIS. From the Fifth London Edition. In one neat royal 12mo. volume, with illustrations; cloth, $2 75. (*Lately Issued.*)

WMAN (JOHN E.), M.D.

TRODUCTION TO PRACTICAL CHEMISTRY, INCLUDING ANALYSIS. Sixth American, from the sixth and revised London edition. With numerous illustrations. In one neat vol., royal 12mo., cloth, $2 25.

MSEN (IRA), M.D., Ph.D.,
Professor of Chemistry in the Johns Hopkins University, Baltimore.

NCIPLES OF THEORETICAL CHEMISTRY, with special reference to the Constitution of Chemical Compounds. In one handsome royal 12mo. vol. of over 232 pages: cloth, $1 50. (*Just Issued.*)

HLER AND FITTIG.

OUTLINES OF ORGANIC CHEMISTRY. Translated with Additions from the Eighth German Ed. By IRA REMSEN, M.D., Ph.D., Prof. of Chem. and Physics in Williams College, Mass. In one volume, royal 12mo. of 550 pp., cloth, $3.

FOWNES (GEORGE), Ph.D.

A MANUAL OF ELEMENTARY CHEMISTRY; Theoretical and

Practical. Revised and corrected by HENRY WATTS, B.A., F R.S., author of "A Diction
ary of Chemistry," etc. With a colored plate, and one hundred and seventy-seven illus
trations. A new American, from the twelfth and enlarged London edition. Edited b
ROBERT BRIDGES, M.D. In one large royal 12mo. volume, of over 1000 pages
cloth, $2 75; leather, $3 25. (*Just Ready.*)

Two careful revisions by Mr. Watts, since the appearance of the last American edition o
"Fownes," have so enlarged the work that in England it has been divided into two volumes. I
reprinting it, by the use of a small and exceedingly clear type, cast for the purpose, it has bee
found possible to comprise the whole, without omission, in one volume, not unhandy for study an
reference. The enlargement of the work has induced the American Editor to confine his additio
to the narrowest compass, and he has accordingly inserted only such discoveries as have been an
nounced since the very recent appearance of the work in England, and has added the standard
in popular use to the Decimal and Centigrade systems employed in the original.

Among the additions to this edition will be found a very handsome colored plate, representin
a number of spectra in the spectroscope. Every care has been taken in the typographical execu
tion to render the volume worthy in every respect of its high reputation and extended use, an
though it has been enlarged by more than one hundred and fifty pages, its very moderate pri
will still maintain it as one of the cheapest volumes accessible to the chemical student.

This work, inorganic and organic, is complete in one convenient volume. In its earliest editions it was fully up to the latest advancements and theories of that time. In its present form, it presents, in a remarkably convenient and satisfactory manner, the principles and leading facts of the chemistry of *to-day*. Concerning the manner in which the various subjects are treated, much deserves to be said, and mostly, too, in praise of the book. A review of such a work as *Fownes's Chemistry* within the limits of a book-notice for a medical weekly is simply out of the question.—*Cincinnati Lancet and Clinic*, Dec. 14, 1878.

When we state that, in our opinion, the present edition sustains in every respect the high reputation which its predecessors have acquired and enjoyed, we express therewith our full belief in its intrinsic value as a text-book and work of reference.—*Am. Journ. of Pharm.*, Aug. 1878.

The conscientious care which has been bestowed upon it by the American and English editors renders it still, perhaps, the best book for the student and the practitioner who would keep alive the acquisitions of his student days. It has, indeed, reached a somewhat formidable magnitude with its more than
thousand pages, but with less than this no fair repr
sentation of chemistry as it now is can be given. Th
type is small but very clear, and the sections are ve
lucidly arranged to facilitate study and reference.
Med and Surg. Reporter, Aug 3, 1878.

The work is too well known to American studen
to need any extended notice; suffice it to say th
the revision by the English editor has been faithfull
done, and that Professor Bridges has added so
fresh and valuable matter, especially in the ino
ganic chemistry. The book has always been a f
vorite in this country, and in its new shape bi
fair to retain all its former *prestige*.—*Boston Jo
of Chemistry*, Aug. 1878.

It will be entirely unnecessary for us to make a
remarks relating to the general character of Fowne
Manual. For over twenty years it has held *the* for
most place as a text-book, and the elaborate a
thorough revisions which have been made from ti
to time leave little chance for any wide awake rival
step before it.—*Canadian Pharm. Jour.*, Aug. 18

As a manual of chemistry it is without a superi
in the language.—*Md. Med. Jour.*, Aug. 1878.

ATTFIELD (JOHN), Ph.D.,

Professor of Practical Chemistry to the Pharmaceutical Society of Great Britain, &c.

CHEMISTRY, GENERAL, MEDICAL, AND PHARMACEUTICAL

including the Chemistry of the U. S. Pharmacopœia. A Manual of the General Princip
of the Science, and their Application to Medicine and Pharmacy. Eighth edition revise
by the author. In one handsome royal 12mo. volume of 700 pages, with illustration
Cloth, $2 50; leather, $3 00. (*Just Ready.*)

We have repeatedly expressed our favorable opinion of this work, and on the appearance of a new edition of it, little remains for us to say, except that we expect this eighth edition to be as indispensable to us as the seventh and previous editions have been. While the general plan and arrangement have been adhered to, new matter has been added covering the observations made since the former edition The present differs from the preceding one chiefly in these alterations and in about ten pages of useful tables added in the appendix.—*Am. Jour. of Pharmacy*, May, 1879.

A standard work like Attfield's Chemistry need only be mentioned by its name, without further comments The present edition contains such alterations and additions as seemed necessary for the demonstration of the latest developments of chemical principles, and the latest applications of chemistry to pharmacy. The author has bestowed arduous labor on the revision, and the extent of the information thus introduced may be estimated from the fact that the index contains three hundred new references relating to additional material.—*Druggists' Circular and Chemical Gazette*, May, 1879.

This very popular and meritorious work has now reached its eighth edition, which fact speaks in the highest terms in commendation of its excellence. It has now become the principal text-book of chemistry in all the medical colleges in t
United States. The present edition contains su
alterations and additions as seemed necessary f
the demonstration of the latest developments
chemical principles, and the latest applications
chemistry to pharmacy It is scarcely necessa
for us to say that it exhibits chemistry in its pr
sent advanced state.—*Cincinnati Medical Ne
April, 1879.

The popularity which this work has enjoyed
owing to the original and clear disposition of t
facts of the science, the accuracy of the details, a
the omission of much which freights many treati
heavily without bringing corresponding instructi
to the reader. Dr. Attfield writes for students, a
primarily for medical students; he always has
eye to the pharmacopœia and its officinal prepa
tions; and he is continually putting the matter
the text so that it responds to the questions wi
which each section is provided. Thus the stude
learns easily, and can always refresh and test h
knowledge.—*Med and Surg. Reporter*, April 19, '7

We noticed only about two years and a half a
the publication of the preceding edition, and r
marked upon the exceptionally valuable charact
of the work. The work now includes the whole
the chemistry of the pharmacopœia of the Unit
States, Great Britain, and India.—*New Remedi
May, 1879.

BLOXAM (*C. L.*),

Professor of Chemistry in King's College, London.

CHEMISTRY, INORGANIC AND ORGANIC. From the Second London Edition.

In one very handsome octavo volume, of 700 pages, with about 300 illustrations. Cloth, $4 00; leather, $5 00. (*Lately Issued.*)

We have in this work a complete and most excel- ent text-book for the use of schools, and can heart- ly recommend it as such.—*Boston Med. and Surg. ourn.*, May 28, 1874.

The above is the title of a work which we can most onscientiously recommend to students of chemis- ry. It is as easy as a work on chemistry could be ade, at the same time that it presents a full account f that science as it now stands. We have spoken f the work as admirably adapted to the wants of udents; it is quite as well suited to the require- ents of practitioners who wish to review their hemistry, or have occasion to refresh their memo- es on any point relating to it. In a word, it is a ook to be read by all who wish to know what is e chemistry of the present day.—*American Prac tioner*, Nov. 1873.

It would be difficult for a practical chemist and teacher to find any material fault with this most admirable treatise. The author has given us almost a cyclopædia within the limits of a convenient volume, and has done so without penning the *useless* paragraphs too commonly making up a great part of the bulk of many cumbrous works. The progressive scientist is not disappointed when he looks for the record of new and valuable processes and discoveries, while the cautious conservative does not find its pages monopolized by uncertain theories and speculations. A peculiar point of excellence is the crystallized form of expression in which great truths are expressed in very short paragraphs. One is surprised at the brief space allotted to an important topic, and yet, after reading it, he feels that little, if any more should have been said. Altogether, it is seldom you see a text-book so nearly faultless. — *Cincinnati Lancet* Nov. 1873.

CLOWES (*FRANK*), *D.Sc., London.*

Senior Science-Master at the High School, Newcastle-under Lyme, etc.

AN ELEMENTARY TREATISE ON PRACTICAL CHEMISTRY AND QUALITATIVE INORGANIC ANALYSIS.

Specially adapted for Use in the Laboratories of Schools and Colleges and by Beginners. From the Second and Revised English Edition, with about fifty illustrations on wood. In one very handsome royal 12mo. volume of 372 pages: cloth, $2 50. (*Now Ready.*)

It is short, concise, and eminently practical. We erefore heartily commend it to students, and espe- ally to those who are obliged to dispense with a aster. Of course a teacher is in every way desi- ble, but a good degree of technical skill and prac- al knowledge can be attained with no other structor than the very valuable handbook now der consideration.—*St Louis Clin. Record*, Oct. 7.

The work is so written and arranged that it can be nprehended by the student without a teacher, and descriptions and directions for the various work are so simple, and yet concise, as to be interesting and intelligible. The work is unincumbered with theoretical deductions, dealing wholly with the practical matter, which it is the aim of this comprehensive text-book to impart. The accuracy of the analytical methods are vouched for from the fact that they have all been worked through by the author and the members of his class, from the printed text. We can heartily recommend the work to the student of chemistry as being a reliable and comprehensive one.—*Druggists' Advertiser*, Oct. 15, 1877.

APP'S TECHNOLOGY; or Chemistry Applied to he Arts, and to Manufactures. With American dditions by Prof. WALTER R. JOHNSON. In two very handsome octavo volumes, with 500 wood engravings, cloth, $6 00.

PARRISH (*EDWARD*),

Late Professor of Materia Medica in the Philadelphia College of Pharmacy.

A TREATISE ON PHARMACY. Designed as a Text-Book for the Student, and as a Guide for the Physician and Pharmaceutist.

With many Formulæ and Prescriptions. Fourth Edition, thoroughly revised, by THOMAS S. WIEGAND. In one handsome octavo volume of 977 pages, with 280 illustrations; cloth, $5 50; leather, $6 50. (*Lately Issued.*)

f Dr. Parrish's great work on pharmacy it only mains to be said that the editor has accomplished work so well as to maintain, in this fourth edi- n, the high standard of excellence which it had ained in previous editions, under the editorship of accomplished author. This has not been accom shed without much labor, and many additions and provements, involving changes in the arrange- ut of the several parts of the work, and the addi- n of much new matter. With the modifications as effected it constitutes, as now presented, a com- ndium of the science and art indispensable to the armacist, and of the utmost value to every actitioner of medicine desirous of familiarizing nself with the pharmaceutical preparation of the icles which he prescribes for his patients.—*Chi- go Med. Journ.*, July, 1874.

The work is eminently practical, and has the rare rit of being readable and interesting, while it pre- ves a strictly scientific character The whole work ects the greatest credit on author, editor and pub her. It will convey some idea of the liberality which s been bestowed upon its production when we men- n that there are no less than 280 carefully executed strations. In conclusion, we heartily recommend the work, not only to pharmacists, but also to the multitude of medical practitioners who are obliged to compound their own medicines. It will ever hold an honored place on our own bookshelves.—*Dublin Med. Press and Circular*, Aug. 12, 1874.

We expressed our opinion of a former edition in terms of unqualified praise, and we are in no mood to detract from that opinion in reference to the present edition, the preparation of which has fallen into competent hands. It is a book with which no pharmacist can dispense, and from which no physician can fail to derive much information of value to him in practice.—*Pacific Med. and Surg. Journ.*, June, '74.

Perhaps one, if not the most important book upon pharmacy which has appeared in the English language has emanated from the transatlantic press. "Parrish's Pharmacy" is a well-known work on this side of the water, and the fact shows us that a really useful work never becomes merely local in its fame. Thanks to the judicious editing of Mr. Wiegand, the posthumous edition of "Parrish" has been saved to the public with all the mature experience of its author, and perhaps none the worse for a dash of new blood.—*Lond. Pharm. Journal*, Oct. 17, 1874.

FARQUHARSON (ROBERT), M.D.,

Lecturer on Materia Medica at St. Mary's Hospital Medical School.

A GUIDE TO THERAPEUTICS AND MATERIA MEDICA.

Second American edition, revised by the Author. Enlarged and adapted to the Pharmacopœia. By FRANK WOODBURY, M.D. In one neat royal 12mo. volume of pages: cloth, $2.25. (*Just Ready.*)

The appearance of a new edition of this convenient and handy book in less than two years may certainly be taken as an indication of its usefulness. Its convenient arrangement, and its terseness, and, at the same time, completeness of the information given, make it a handy book of reference.—*Am. Journ. of Pharmacy*, June, 1879.

This work contains in moderate compass such well-digested facts concerning the physiological and therapeutical action of remedies as are reasonably established up to the present time. By a convenient arrangement the corresponding effects of each article in health and disease are presented in parallel columns, not only rendering reference easier, but also impressing the facts more strongly upon the mind of the reader. The book has been adapted to the wants of the American student, and copious notes have been introduced, embodyin latest revision of the Pharmacopœia, together the antidotes to the more prominent poisons, such of the newer remedial agents as seemed sary to the completeness of the work. Tab weights and measures, and a good alphabeti dex end the volume.—*Druggists' Circula Chemical Gazette*, June, 1879.

It is a pleasure to think that the rapidity which a second edition is demanded may be as an indication that the sense of appreciation value of reliable information regarding the remedies is not entirely overwhelmed in the tion of pathological studies, characteristic of t sent day. This work certainly merits the su has so quickly achieved.—*New Remedies*, J

STILLÉ (ALFRED), M. D.,

Professor of Theory and Practice of Medicine in the University of Penna.

THERAPEUTICS AND MATERIA MEDICA; a Systematic Tr

on the Action and Uses of Medicinal Agents, including their Description and Fourth edition, revised and enlarged. In two large and handsome 8vo. vols. of ab pages. Cloth, $10; leather, $12. (*Lately Issued.*)

It is unnecessary to do much more than to announce the appearance of the fourth edition of this well known and excellent work.—*Brit. and For. Med.-Chir. Review*, Oct 1875.

For all who desire a complete work on therapeutics and materia medica for reference, in cases involving medico-legal questions, as well as for information concerning remedial agents, Dr. Stillé's is "*par excellence*" the work. The work being out of print, by the exhaustion of former editions, the author has laid the profession under renewed obligations, by the careful revision, important additions, and timely reissuing a work not exactly supplemented by any other in the English language, if in any language. The mechanical execution handsomely sustains the well-known skill and good taste of the publisher.—*St. Louis Med. and Surg. Journal*, Dec 1874.

From the publication of the first edition "Stillé's Therapeutics" has been one of the classics; its absence from our libraries would create a vacuum which could be filled by no other work in the language, and its presence supplies, in the two volumes of the present edition, a whole cyclopædia peutics.—*Chicago Medical Journal*, Feb.

The rapid exhaustion of three editions an versal favor with which the work has been by the medical profession, are sufficient pr excellence as a repertory of practical and formation for the physician. The edition fully sustains this verdict, as the work has fully revised and in some portions rewritt ing it up to the present time by the ad chloral and croton-chloral, nitrite of amy ride of methylene, methylic ether, lith pounds, gelseminum, and other remedi *Journ. of Pharmacy*, Feb. 1875.

We can hardly admit that it has a riv multitude of its citations and the fulness search into clinical histories, and we must a place in the physician's library; not, fully representing the present state of kno pharmacodynamics, but as by far the most treatise upon the clinical and practical si question.—*Boston Med. and Surg. Journal* 1874.

GRIFFITH (ROBERT E.), M.D.

A UNIVERSAL FORMULARY, Containing the Methods of P

ing and Administering Officinal and other Medicines. The whole adapted to Physi Pharmaceutists. Third edition, thoroughly revised, with numerous additions, by J MAISCH, Professor of Materia Medica in the Philadelphia College of Pharmacy. In o and handsome octavo volume of about 800 pp., cl., $4 50; leather, $5 50. (*Lately*

To the druggist a good formulary is simply indispensable, and perhaps no formulary has been more extensively used than the well-known work before us. Many physicians have to officiate, also, as druggists. This is true especially of the country physician, and a work which shall teach him the means by which to administer or combine his remedies in the most efficacious and pleasant manner, will always hold its place upon his shelf. A formulary of this kind is of benefit also to the city physician in largest practice.—*Cincinnati Clinic*, Feb. 21, 1874.

A more complete formulary than it is in ent form the pharmacist or physician could desire. To the first some such work is ind ble, and it is hardly less essential to the pra who compounds his own medicines. Much is contained in the introduction ought to mitted to memory by every student of As a help to physicians it will be found inv and doubtless will make its way into libr already supplied with a standard work of t —*The American Practitioner*, Louisville, J

CHRISTISON'S DISPENSATORY. With copious additions, and 213 large wood engravings. By R. EGLESFIELD GRIFFITH, M.D. One vol. 8vo., pp. 1000, cloth. $4 00.

CARPENTER'S PRIZE ESSAY ON THE ALCOHOLIC LIQUORS IN HEALTH AND DISEA edition, with a Preface by D. F. CONDIE, M explanations of scientific words. In one ne volume, pp. 178, cloth. 60 cents.

TILLE (ALFRED), M.D., LL.D., and MAISCH (JOHN M.), Ph.D.,

Prof of Theory and Practice of Medicine and of Clinical Med. in Univ. of Pa.

Prof. of Mat. Med. and Bot in Phila. Coll. Pharmacy, Secy. to the American Pharmaceutical Association.

HE NATIONAL DISPENSATORY: Containing the Natural History, Chemistry, Pharmacy, Actions and Uses of Medicines, including those recognized in the Pharmacopœias of the United States, Great Britain, and Germany, with numerous references to the French Codex. Second edition, thoroughly revised, with numerous additions. In one very handsome octavo volume of 1692 pages, with 239 illustrations. Extra cloth, $6 75; leather, raised bands, $7 50. (*Now Ready*)

Preface to the Second Edition.

e demand which has exhausted in a few months an unusually large edition of the National satory is doubly gratifying to the authors, as showing that they were correct in thinking the want of such a work was felt by the medical and pharmaceutical professions, and that efforts to supply that want have been acceptable. This appreciation of their labors has lated them in the revision to render the volume more worthy of the very marked favor which it has been received. The first edition of a work of such magnitude must necessarily e or less imperfect; and though but little that is new and important has been brought t in the short interval since its publication, yet the length of time during which it was g through the press rendered the earlier portions more in arrears than the later. The unity for a revision has enabled the authors to scrutinize the work as a whole, and to uce alterations and additions wherever there has seemed to be occasion for improve- er greater completeness. The principal changes to be noted are the introduction of seve- gs under separate headings, and of a large number of drugs, chemicals, and pharma- l preparations classified as allied drugs and preparations under the heading of more nt or better known articles: these additions comprise in part nearly the entire German copœia and numerous articles from the French Codex. All new investigations which the authors' notice up to the time of publication have received due consideration.

ries of illustrations has undergone a corresponding thorough revision. A number have ded, and still more have been substituted for such as were deemed less satisfactory.

ew matter embraced in the text is equal to nearly one hundred pages of the first edition. able as are these changes as a whole, they have been accommodated by an enlargement ge without increasing unduly the size of the volume.

numerous additions have been made to the sections which relate to the physiological f medicines and their use in the treatment of disease, great care has been taken to hem as concise as was possible without rendering them incomplete or obscure. The ve been expressed in the terms both of troy weight and of the metrical system, for the of making those who employ the Dispensatory familiar with the latter, and paving the its introduction into general use.

herapeutical Index has been extended by about 2250 new references, making the total in the present edition about 6000.

rticles there enumerated as remedies for particular diseases are not only those which, uthors' opinion, are curative, or even beneficial, but those also which have at any time ployed on the ground of popular belief or professional authority. It is often of as consequence to be acquainted with the worthlessness of certain medicines or with the limits of their power, as to know the well attested virtues of others and the conditions which they are displayed. An additional value possessed by such an Index is, that it the elements of a natural classification of medicines, founded upon an analysis of the of experience, which is the only safe guide in the treatment of disease.

evidence of success, seldom paralleled, clearly how well the authors have met the needs of the pharmaceutical and medical s. Gratifying as it must be to them, they braced the opportunity offered for a thor- vision of the whole work, striving to em- his it all that might have been omitted in r edition, and all that has newly appeared t importance during the time of its col- n, and the short interval elapsed since the publication. After having gone carefully the volume we must admit that the authors ored faithfully, and with success, in main- the high character of their work as a com- meeting the requirements of the day, to e can safely turn in quest of the latest in- concerning everything worthy of notice in on with Pharmacy, Materia Medica, and peutics.—*Am. Jour. of Pharmacy*, Nov. 1879.

with great pleasure that we announce to our the appearance of a *second* edition of the l Dispensatory. The total exhaustion of the ition in the short space of six months, is a t testimony to the value placed upon the by the profession. It appears that the rapid the first edition must have induced both the and the publisher to make preparations for edition immediately after the first had been , for we find a large amount of new matter and a good deal of the previous text altered proved, which proves that the authors do not intend to let the grass grow under their feet, but to keep the work up to the time.—*New Remedies*, Nov. 1879.

This is a great work by two of the ablest writers on materia medica in America. The authors have produced a work which, for accuracy and comprehensiveness, is unsurpassed by any work on the subject. There is no book in the English language which contains so much valuable information on the various articles of the materia medica. The work has cost the authors years of laborious study, but they have succeeded in producing a dispensatory which is not only *national*, but will be a lasting memorial of the learning and ability of the authors who produced it.—*Edinburgh Medical Journal*, Nov. 1879.

A new edition of this great work, only a few months after the first, takes us by surprise. It indicates the high appreciation of its value on the part of physicians and pharmacists, by which a large edition has been so soon exhausted. The present is not merely a reprint but a revision, with important additions and modifications, requiring 100 pages of new matter, and an index increased by 2250 references. The doses are stated in both the ordinary and metric terms. All the more important material of the German and French Pharmacopœias is embodied. It is by far more international or universal than any other book of the kind in our language, and more comprehensive in every sense.—*Pacific Med. and Surg. Journ.*, Oct. 1879.

CORNIL (V.), AND *RANVIER (L.),*
Prof. in the Faculty of Med., Paris. *Prof. in the College of France.*

MANUAL OF PATHOLOGICAL HISTOLOGY.

Translated, Notes and Additions, by E. O. Shakespeare, M.D., Pathologist and Ophthalmic S to Philada. Hospital, Lecturer on Refraction and Operative Ophthalmic Surgery i of Penna., and by Henry C. Simes, M. D., Demonstrator of Pathological Hist the Univ. of Pa. In one very handsome octavo volume of over 700 pages, wi 350 illustrations. Cloth, $5 50; leather, $6 50. (*Just Ready.*)

The work of Cornil and Ranvier is so well known as a lucid and accurate text-boo important subject, that no apology is needed in presenting a translation of it to the A profession. It is only necessary to say that the labors of Drs. Shakespeare and Sim been by no means confined to the task of rendering the work into English. As it app France, in successive portions, between 1868 and 1876, a part of it, at least, was some arrears of the present state of science, while the diffuseness of other portions rendered sation desirable. The translators have, therefore, sought to bring the work up to t and, at the same time, to reduce it in size, as far as practicable, without impairing i pleteness These changes will be found throughout the volume, the most extensive the sections devoted to Sarcoma, Carcinoma, Tuberculosis, the Bloodvessels, the Mam the classification of tumors Corresponding modifications have been made in the ver sive and beautiful series of illustrations, and every care has been taken in the typog execution to render it one of the most attractive volumes which have issued from the A press.

The translators have done their work very well indeed, rendering it into smooth and excellent English, and in their selection of new material they have in the main used good discrimination. We heartily commend the book as one of the best works on the subject.—*Boston Med. and Surg. Journal,* March 11, 1880.

This work, in the original, has for years past occupied a prominent place in the library of French pathologists, as we should naturally be led to believe from the reputation of the distinguished authors. Now that it has been presented to the English student for the first time, it will be perused with unusual interest. The illustrations are by no means the least valuable part of the work. Indispensable as they are to any work of this nature, in the work before us the artist has succeeded in producing cuts which will prove unusually valuable to the reader. The translation is well done, and gives evidence throughout the volume tha made by a person thoroughly conversant subject.—*N. Y. Med. Gazette,* Feb. 28, 1880.

This will be found an exceedingly in and valuable work by all who are engag study of or take an interest in, histology or morbid. The material which was util preparation was derived from autopsies a tions in the hospitals of Paris, which ar rich in it. Nothing was taken for gra everything verified by microscopical inv by the authors themselves in their own la assisted by their pupils. As an aid to mic in their investigations it will be found inv in fact, the very best with which we are a —*Cincinnati Med News,* February, 1880.

We can conscientiously recommend th to the profession.—*Maryland Med. Jour* 1880.

FENWICK (SAMUEL), M.D.,
Assistant Physician to the London Hospital.

THE STUDENT'S GUIDE TO MEDICAL DIAGNOSIS.

Fr Third Revised and Enlarged English Edition. With eighty-four illustrations o In one very handsome volume, royal 12mo., cloth, $2 25. (*Just Issued.*)

GREEN (T. HENRY), M.D.,
Lecturer on Pathology and Morbid Anatomy at Charing-Cross Hospital Medical Sch

PATHOLOGY AND MORBID ANATOMY.

Third America the Fourth and Enlarged and Revised English Edition. In one very handso volume of 332 pages, with 132 illustrations; cloth, $2 25. (*Just Ready.*)

This is unquestionably one of the best manuals on the subject of pathology and morbid anatomy that can be placed in the student's hands, and we are glad to see it kept up to the times by new editions. Each edition is carefully revised by the author, with the view of making it include the most recent advances in pathology, and of omitting whatever may have become obsolete.—*N. Y. Med. Jour.,* Feb. 1879.

The treatise of Dr. Green is compact, clearly expressed, up to the times, and popular as a text-book, both in England and America. The cuts are sufficiently numerous, and usually well mad present edition, such new matter has been was necessary to embrace the later results logical research. No doubt it will continu the favor it has received at the hands of t sion.—*Med and Surg. Reporter,* Feb. 1, 1

For practical, ordinary daily use, this is edly the best treatise that is offered to st pathology and morbid anatomy.—*Cincin ost and Clinic,* Feb. 8, 1879.

GLUGE'S ATLAS OF PATHOLOGICAL HISTOLOGY Translated, with Notes and Additions, by Joseph Leidy, M. D. In one volume, very large imperial quarto, with 320 copper-plate figures, plain and colored, cloth. $4 00.

PAVY'S TREATISE ON THE FUNCTION OF DIGESTION: its Disorders and their Treatment. From the second London edition. In one handsome volume, small octavo, cloth, $2 00.

LINT (AUSTIN), M.D.,

Professor of the Principles and Practice of Medicine in Bellevue Med. College, N. Y.

TREATISE ON THE PRINCIPLES AND PRACTICE OF MEDICINE; designed for the use of Students and Practitioners of Medicine. Fourth edition, revised and enlarged. In one large and closely printed octavo volume of about 1100 pp.; cloth, $6 00; or strongly bound in leather, with raised bands, $7 00. (*Lately Issued.*)

s excellent treatise on medicine has acquired
elf in the United States a reputation similar to
joyed in England by the admirable lectures
Thomas Watson. We have referred to many
most important chapters, and find the revi-
oken of in the preface is a genuine one, and
author has very fairly brought up his matter
evel of the knowledge of the present day. The
s this great recommendation, that it is in one
, and therefore will not be so terrifying to the
as the bulky volumes which several of our
text-books of medicine have developed into.
and Foreign Med.-Chir. Rev., Jan. 1875

course unnecessary to introduce or eulogize
w standard treatise. The present edition
enlarged and revised to bring it up to the
's present level of experience and reading. His own clinical studies and the latest contributions to medical literature both in this country and in Europe, have received careful attention, so that some portions have been entirely rewritten, and about seventy pages of new matter have been added.—*Chicago Med Jour.*, June, 1873.

Has never been surpassed as a text-book for students and a book of ready reference for practitioners. The force of its logic, its simple and practical teachings, have left it without a rival in the field *N. Y.—Med. Record*, Sept. 15, 1874.

It is given to very few men to tread in the steps of Austin Flint, whose single volume on medicine, though here and there defective, is a masterpiece of lucid condensation and of general grasp of an enormously wide subject.—*Lond. Practitioner*, Dec.'78.

E SAME AUTHOR.

LINICAL MEDICINE; a Systematic Treatise on the Diagnosis and Treatment of Diseases. Designed for Students and Practitioners of Medicine. In e large and handsome octavo volume of 795 pages; cloth, $4 50; leather, $5 50. *Now Ready.*)

that the skill and learning of the great
are displayed He has given us a store-
medical knowledge, excellent for the stu-
enient for the practitioner, the result of a
f the most faithful clinical work, collect-
energy as vigilant and systematic as un-
d weighed by a judgment no less clear
observation is close.—*Archives of Medi-*
. 1879

hor of the above work has anticipated a
g felt by those for whom it was especially
the clinical student during his pupilage,
busy practitioner. He has given to the
profession a very necessary and useful
plete in detail, accurate in observation,
statement.—*St. Louis Courier of Med.*,
.

is every reason to believe that this book
well received. The active practitioner is
y in need of some work that will enable
obtain information in the diagnosis and
t of cases with comparatively little labor.
has the faculty of expressing himself clearly, and at the same time so concisely as to enable the searcher to traverse the entire ground of his search, and at the same time obtain all that is essential, without plodding through an interminable space.—*N. Y. Med. Jour.*, Nov. 1879

The eminent teacher who has written the volume under consideration has recognized the needs of the American profession, and the result is all that we could wish. The style in which it is written is peculiarly the author's; it is clear and forcible, and marked by those characteristics which have rendered him one of the best writers and teachers this country has ever produced. We have not space for so full a consideration of this remarkable work as we would desire.—*S. Louis Clin. Record*, Oct. 1879.

It is venturing little to say that there are few men so well fitted as Dr Flint to impart information on these last mentioned subjects, and the present work is a timely one as relates both to the author's capacity to undertake it and the need for it as an accompaniment to the multitude now issued, in which the subject of treatment is but little considered.—*New Remedies*, Nov. 1879.

A TREATISE ON THE PRACTICE OF MEDICINE. Sec

American edition, revised by the Author. Edited, with Additions, by JAMES H. Il
INSON, M.D., Physician to the Penna. Hospital. In one handsome octavo volu
nearly 1200 pages. With illustrations. Cloth, $5 50; leather, $6 50. (*Just R*

In reprinting this work from the recent thoroughly revised second English editio
author has made such corrections as seemed advisable, and has added a chapter on I
The Editor has likewise revised his additions in the light of the latest experience,
work is presented as reflecting in every way the most modern aspect of medical scien
as fully entitled to maintain the distinguished position accorded to it on both sides
Atlantic as an authoritative guide for the student, and a complete though concise t
reference for the practitioner. Notwithstanding the author's earnest effort at comp
the additions have amounted to about one-tenth of the previous edition: but by the u
enlarged page these have been accommodated without increasing the size of the volume,
a reduction in the price renders it one of the cheapest works accessible to the profession.

A new edition of this well-known work which has had the advantage of careful revision not only by its author but also by Dr Hutchinson, than whom there is no one in this country better fitted for the task.—*Phila. Med. Times*, Jan. 3, 1880.

The popularity of the work depends, no doubt, upon the clear and incisive way in which it is written, and the attention to details likely to occur in practice, rather than the discussion of questions of theory.—*New Remedies*, Jan 1880.

What we said of the first edition, we can, with increased emphasis, repeat concerning this:
page is characterized by the utterances of a
ful man. What has been said, has been w
and the book is a *fair reflex* of all that is c
known on the subjects considered."—*Oh*
Recorder, Jan. 7, 1880.

This is not only one of the latest and m
prehensive works out on the general s
Theory and Practice of Medicine, but it is
tionably one of the best.—*So. Med. Prac*

Hospital, etc.***

ON THE DISEASES OF THE ABDOMEN, COMPRISING T

of the Stomach, and other parts of the Alimentary Canal, Œsophagus, Cæcum
tines, and Peritoneum. Second American, from the third enlarged and revis
lish edition. With illustrations. In one handsome octavo volume of over 50
Cloth, $3 50. (*Now Ready.*)

We can do very little to add to the favorable reception which has already been given by the medical press of the world to this well known treatise. We commend to all practitioners a careful perusal of Dr. Habershon's work. More especially, we draw attention to the number of intestinal diseases recorded in its pages, cases of extreme interest clinically and pathologically. This careful record shows that the work is no compilation but a careful exposition of the author's personal experience.—*Canadian Med. and Surg. Journ.*, May, 1879.

This valuable treatise on diseases of the stomach and abdomen has been out of print for several years, and is therefore not so well known to the profession as it deserves to be. It will be found a cyclopædia of information, systematically arranged, o
eases of the alimentary tract, from the mo
rectum. A fair proportion of each chapter
ed to symptoms, pathology, and therapeut
present edition is fuller than former ones
particulars, and has been thoroughly rev
amended by the author. Several new chap
been added, bringing the work fully up to t
and making it a volume of interest to the pra
in every field of medicine and surgery. F
nutrition is in some form associated with all
we have to combat, and we need all the l
can be obtained on a subject so broad and
Dr Habershon's work is one that every pra
should read and study for himself.—*N.*
Journ., April, 1879.

EYNOLDS (J. RUSSELL), M.D.,

Prof. of the Principles and Practice of Medicine in Univ. College, London.

SYSTEM OF MEDICINE WITH NOTES AND ADDITIONS BY HENRY HARTSHORNE, M D., late Professor of Hygiene in the University of Penna. In three large and handsome octavo volumes, containing about 3000 closely printed double-columned pages, with numerous illustrations. Sold only by subscription. Price per vol , in cloth, $5.00; in leather, $6.00.

me I. (*just ready*) contains General Diseases and Diseases of the Nervous System.
me II. (*just ready*) contains Diseases of Respiratory and Circulatory Systems.
me III. (*nearly ready*) will contain Diseases of the Digestive and Blood Glandular ystems, of the Urinary Organs, of the Female Reproductive System, and of the Cutaneous System.

nolds's System of Medicine, recently completed, has acquired, since the first appearance first volume, the well-deserved reputation of being the work in which modern British ine is presented in its fullest and most practical form. This could scarce be otherwise in f the fact that it is the result of the collaboration of the leading minds of the profession, bject being treated by some gentleman who is regarded as its highest authority—as for ce, Diseases of the Bladder by Sir Henry Thompson, Malpositions of the Uterus by y Hewitt, Insanity by Henry Maudsley, Consumption by J. Hughes Bennet, Dis-f the Spine by Charles Bland Radcliffe, Pericarditis by Francis Sibson, Alcoholism ncis E. Anstie, Renal Affections by William Roberts, Asthma by Hyde Salter, al Affections by H Charlton Bastian, Gout and Rheumatism by Alfred Baring Gar-Constitutional Syphilis by Jonathan Hutchinson, Diseases of the Stomach by Wilson Diseases of the Skin by Balmanno Squire, Affections of the Larynx by Morell Mac-, Diseases of the Rectum by Blizard Curling, Diabetes by Lauder Brunton, Intes-Diseases by John Syer Bristowe, Catalepsy and Somnambulism by Thomas King Cham-Apoplexy by J. Hughlings Jackson, Angina Pectoris by Professor Gairdner, Emphy-f the Lungs by Sir William Jenner, etc etc. All the leading schools in Great Britain ributed their best men in generous rivalry, to build up this monument of medical sci-. Bartholomew's, Guy's, St Thomas's, University College, St Mary's in London, while burgh, Glasgow, and Manchester schools are equally well represented, the Army Medical Netley, the military and naval services, and the public health boards. That a work d in such a spirit, and carried out under such auspices should prove an indispensable y of facts and experience, suited to the daily wants of the practitioner, was inevitable, and ss which it has enjoyed in England, and the reputation which it has acquired on this the Atlantic, have sealed it with the approbation of the two pre-eminently practical nations. ge size and high price having kept it beyond the reach of many practitioners in this who desire to possess it, a demand has arisen for an edition at a price which shall ren-ccessible to all. To meet this demand the present edition has been undertaken. The mes and five thousand pages of the original will by the use of a smaller type and double , be compressed into three volumes of about three thousand pages, clearly and hand-printed, and offered at a price which will render it one of the cheapest works ever pre-to the American profession.

ot only will the American edition be more convenient and lower priced than the English; lso be better and more complete. Some years having elapsed since the appearance of a of the work, additions will be required to bring up the subjects to the existing condition e. Some diseases, also, which are comparatively unimportant in England, require more treatment to adapt the articles devoted to them to the wants of the American physi-d there are points on which the received practice in this country differs from that abroad. The supplying of these deficiencies has been undertaken by Henry Harts-M.D., late Professor of Hygiene in the University of Pennsylvania, who will endeavor the work fully up to the day, and as useful to the American physician as it has proved his English brethren. The number of illustrations will also be largely increased, and will be spared to render the typographical execution unexceptionable in every respect. and second volumes are now ready, and the completion of the whole may be expected

y too much praise can scarcely be given to is book. It is a cyclopædia of medicine by some of the best men of Europe. It is eful information such as one finds frequent in one's daily work; for no one head can carry all the knowledge one needs in gen-ctice, and one must refer sometimes to one's As a book of reference it is invaluable. It with the times. It is clear and concentrated , and its form is worthy of its famous pub-—*Louisville Med. News*, Jan. 31, 1880.

olds' System of Medicine" is justly con-the most popular work on the principles and of medicine in the English language The ors to this work are gentlemen of well-reputation on both sides of the Atlantic. ntleman has striven to make his part of the as practical as possible, and the information ed is such as is needed by the busy practi-—*St Louis Med. and Surg. Journ.*, Jan. 20,

artshorne has made ample additions and re-so far, all of which give increased value to ume, and render it more useful to the Ameri-practitioner. There is no volume in English l literature more valuable, and every pur-r will, on becoming familiar with it, congrat himself on the possession of this vast storehouse of information, in regard to so many of the subjects with which he should be familiar —*Gaillard's Med. Journ*, Feb. 18.0

There is no medical work which we have in times past more frequently and fully consulted when perplexed by doubts as to treatmen , or by having unusual or apparently inexplicable symptoms presented to us than "Reynolds' System of Medicine." Among its contributors are gentlemen who are as well known by reputation upon this side of the Atlantic as in Great Britain, and whose right to speak with authority upon the subjects about which they have written, is recognized the world over. They have evidently striven to make their essays as practical as possible, and while these are sufficiently full to entitle them to the name of monographs, they are not loaded down with such an amount of detail as to render them wearisome to the general reader. In a word, they contain just that kind of information which the busy practitioner frequently finds himself in need of. In order that any deficiencies may be supplied, the publishers have committed the preparation of the book for the press to Dr. Henry Hartshorne, whose judicious notes distributed throughout the volume afford abundant evidence of the thoroughness of the revision to which he has subjected it.—*Am. Jour. Med. Sciences*, Jan. 1880.

FINLAYSON (JAMES), M.D.,

Physician and Lecturer on Clinical Medicine in the Glasgow Western Infirmary, etc.

CLINICAL DIAGNOSIS; A Handbook for Students and Practitioners of Medicine. In one handsome 12mo. volume, of 546 pages, with 85 illustrations. Cloth, $2 63. (*Just Ready.*)

The book is an excellent one, clear, concise, convenient, practical. It is replete with the very knowledge the student needs when he quits the lecture-room and the laboratory for the ward and sick-room, and does not lack in information that will meet the wants of experienced and older men.—*Phila. Med. Times*, Jan. 4, 1879.

The aim of the author is to teach a student and practitioner how to examine a case so as to use "*all his knowledge*" in arriving at a diagnosis. All the various symptoms of the several systems are grouped together in such a manner as to make their relations to a final diagnosis clear and easy of apprehension. This work has been done by men of large experience and trained observation, who have been long recognized as authorities upon the subjects which they treat. There is a profusion of illustrations to illustrate subjects under discussion. The application of electricity, and instruments of precision in diagnosis, is fully discussed. This book is all good. We commend it to all students and practitioners of medicine as a work worthy of a place in their libraries.—*Ohio Med. Recorder*, Dec. 1878.

This is one of the really useful books. It is attractive from preface to the final page, and ought to be given a place on every office table, because it contains in a condensed form all that is valuable in semeiology and diagnostics to be found in bulkier volumes, and because in its arrangement and complete index, it is unusually convenient for quick reference in any emergency that may come upon the busy practitioner. —*N. C. Med. Journ.*, Jan. 1879.

HAMILTON (ALLAN McLANE), M.D.,

Attending Physician at the Hospital for Epileptics and Paralytics, Blackwell's Island, N.Y., and at the Out-Patients' Department of the New York Hospital.

NERVOUS DISEASES; THEIR DESCRIPTION AND TREATMENT. In one handsome octavo volume of 512 pages, with 53 illus.; cloth, $3 50. (*Now Ready.*)

This is unquestionably the best and most complete text-book of nervous diseases that has yet appeared, and were international jealousy in scientific affairs at all possible, we might be excused for a feeling of chagrin that it should be of American parentage. This work, however, has been performed in New York, and has been so well performed that no room is left for anything but commendation. With great skill, Dr. Hamilton has presented to his readers a succinct and lucid survey of all that is known of the pathology of the nervous system, viewed in the light of the most recent researches. From the preliminary description of the methods of examination and study, and of the instruments of precision employed in the investigation of nervous diseases, up till the final collection of formulæ, the book is eminently practical.—*Brain*, London, Oct. 1878.

From a very careful examination of the whole work, we can justly say that the author has not only clearly and fully treated of diagnosis and treatment, but, unlike most works of this class, it is very comprehensive in regard to etiology, and exposes the pathology of nervous diseases in the light of the very latest experiments and discoveries. The drawings are excellent and well selected. After this careful revision, we can heartily recommend this work to students and general practitioners in particular as being a full exposition of diseases of the nervous system, their pathology and treatment, to date.—*N. Y. Med. Record*, Aug. 3, 1878.

CHARCOT (J. M.),

Professor to the Faculty of Med. Paris, Phys. to La Salpêtrière, etc.

LECTURES ON DISEASES OF THE NERVOUS SYSTEM. Translated from the Second Edition by GEORGE SIGERSON, M.D., M.Ch., Lecturer on Biology, etc., Cath. Univ. of Ireland. With illustrations. 1 vol. 8vo. of 288 pages. Cloth, $1 75. (*Just Ready.*)

CLINICAL OBSERVATIONS ON FUNCTIONAL NERVOUS DISORDERS. By C. HANDFIELD JONES, M.D., Physician to St. Mary's Hospital, &c. Second American Edition. In one handsome octavo volume of 348 pages, cloth, $3 25.

MORRIS (MALCOLM), M.D.,

Joint Lecturer on Dermatology, St. Mary's Hospital Med. School.

SKIN DISEASES, Including their Definitions, Symptoms, Diagnosis, Prognosis, Morbid Anatomy, and Treatment. A Manual for Students and Practitioners. In one 12mo. volume of over 300 pages. With illustrations. Cloth, $1 75. (*Just Ready.*)

The book is clearly and concisely written, and the subject is handled in a way calculated to be readily intelligible to students. The type is excellent, the work neatly got up and of convenient size, and the manual ought to be very useful for the purpose for which it is intended.—*London Lancet*, Jan. 31, 1880.

FOX (TILBURY), M.D., F.R.C.P., and T. C. FOX, B.A., M.R.C.S.,

Physician to the Department for Skin Diseases, University College Hospital.

EPITOME OF SKIN DISEASES. WITH FORMULÆ. FOR STUDENTS AND PRACTITIONERS. Second edition, thoroughly revised and greatly enlarged. In one very handsome 12mo. volume of 216 pages. Cloth, $1 38. (*Just Ready.*)

The names of the authors are quite sufficient to commend this book, Dr. Tilbury Fox being well known as occupying a place in the front rank of dermatologists of the day.—*Canadian Journal of Med. Sci.*, May, 1878.

The present edition of the Epitome considerably exceeds in size, and surpasses in use, its predecessor. The work is certainly a valuable addition to the "handy volume" department of medical literature.—*The Med. Bulletin*, May, 1878.

WILSON'S STUDENT'S BOOK OF CUTANEOUS MEDICINE and DISEASES OF THE SKIN. In one very handsome royal 12mo. volume. $3 50.

HILLIER'S HANDBOOK OF SKIN DISEASES, for Students and Practitioners. Second Am Ed In one royal 12mo. vol. of 358 pp. With illustrations. Cloth, $2 25.

LINT (AUSTIN), M.D.,

Professor of the Principles and Practice of Medicine in Bellevue Hospital Med. College, N. Y.

A MANUAL OF PERCUSSION AND AUSCULTATION; of the

Physical Diagnosis of Diseases of the Lungs and Heart, and of Thoracic Aneurism. Second edition. In one handsome royal 12mo. volume: cloth, $1 63. (*Just Ready.*)

f. Flint is so well known as a medical teacher writer that it seems superfluous to state that bject has been treated in a thorough and sys- manner. In revising it for a second edition th r has confined himself to such additions as likely to render it more useful. not only to ts engaged in the practical study of the sub- but also to practitioners as a hand book for reference, and we do not hesitate in saying t would prove a valuable addition to every physician's library.—*Med. and Surg. Reporter*, March 13. 1880.

The little work before us has already become a standard one. and has become extensively adopted as a text-book. There is certainly none better. It contains the substance of the lessons which the author has for many years given, in connection with practical instruction in auscultation and percussion, to private classes, composed of medical students and practitioners.—*Cincinnati Med. News*, Feb. 1880.

Professor of Venereal Diseases at the Col. of Phys. and Surg., New York, &c.

THE PATHOLOGY AND TREATMENT OF VENEREAL DISEASES.

Including the results of recent investigations upon the subject. Fourth edition, revised and largely rewritten with the co-operation of R. W. Taylor, M.D., of New York, Prof. of Dermatology in the Univ. of Vt. In one large and handsome octavo volume of 835 pages, with 138 illustrations. Cloth, $4 75; leather, $5 75 (*Just Ready.*)

This work, on its first appearance, immediately took the position of a standard authority on its subject wherever the language is spoken, and the success of an Italian translation shows that it is regarded with equal favor on the Continent of Europe. In repeated editions the author labored sedulously to render it more worthy of its reputation, and in the present revision no pains have been spared to perfect it as far as possible. Several years having elapsed since the publication of the third edition, much material has been accumulated during the interval by the industry of syphilologists, and new views have been enunciated. All this so far as confirmed by observation and experience, has been incorporated; many portions of the volume been rewritten, the series of illustrations has been enlarged and improved, and the whole may be regarded rather as a new work than as a new edition. It is confidently presented as fully on a level with the most advanced condition of syphilology, and as a work to which the practitioner may refer with the certainty of finding clearly and succinctly set forth whatever falls within the scope of such a treatise.

However valuable the previous editions have been, the present is, to our thinking, decidedly of more worth. An air of completeness—of having had garnered into its pages all the best fruit of the world's experience and research upon the subject of which it treats—has been given to the book, without in any way detracting from the peculiarly practical value of previous editions. None the less clinical, the treatise seems much more cosmopolitan. The possession of old editions will be no excuse to the progressive physician for not purchasing this edition, and we predict for it a very speedy sale. We congratulate Dr. Bumstead on the wisdom which led to the selection of Dr. Taylor as colleague, and we sincerely congratulate the two coworkers upon the results of their labor.—*Philadelphia Medical Times*, Dec. 6, 1879.

As it now stands, this is the only complete modern work devoted exclusively to the discussion of venereal diseases. It was needed, and will be cordially welcomed by all who desire to keep abreast with the times in their knowledge of these subjects. It is one of the few really good books needed by every practitioner of medicine or surgery, whether he be a general practitioner or specialist.—*Detroit Lancet*, December, 1879.

Dr. Bumstead's successful labors entitle him now to rank pre-eminently as *the* authority in this country on venereal diseases. But not only does this fact make his present treatise of interest to practitioners; the book is fully abreast with present literature on the subject of which it treats, is extremely practical in descriptions of the several venereal diseases and modes of treatment, and hence should be in every doctor's library.—*Va. Med. Monthly* December, 1879.

CULLERIER (A.), and *BUMSTEAD (FREEMAN J.),*
Surgeon to the Hôpital du Midi.
Professor of Venereal Diseases in the College of Physicians and Surgeons, N. Y

AN ATLAS OF VENEREAL DISEASES. Translated and Edited by

FREEMAN J. BUMSTEAD. In one large imperial 4to. volume of 328 pages, double-columns, with 26 plates, containing about 150 figures, beautifully colored, many of them the size of life; strongly bound in cloth, $17 00; also, in five parts, stout wrappers, at $3 per part.

Anticipating a very large sale for this work, it is offered at the very low price of THREE DOLLARS a Part, thus placing it within the reach of all who are interested in this department of practice. Gentlemen desiring early impressions of the plates would do well to order it without delay. A specimen of the plates and text sent free by mail, on receipt of 25 cents.

ITH (J. LEWIS), M.D.,

Clinical Professor of Diseases of Children in the Bellevue Hospital Med. College, N Y.

COMPLETE PRACTICAL TREATISE ON THE DISEASES OF CHILDREN. Fourth Edition, revised and enlarged. In one handsome octavo volume of about 750 pages, with illustrations. Cloth, $4 50; leather, $5 50. (*Now Ready*)

very marked favor with which this work has been received wherever the English lan- is spoken, has stimulated the author, in the preparation of the Fourth Edition, to spare ns in the endeavor to render it worthy in every respect of a continuance of professional ence. Many portions of the volume have been rewritten, and much new matter intro- , but by an earnest effort at condensation, the size of the work has not been materially ed.

e period which has elapsed since the third of the work, so extensive have been the ad- that whole chapters required to be rewritten. dly a page could pass without some material n or addition. This labor has occupied the losely, and he has performed it conscien- so that the book may be considered a faith- ture of an exceptionally wide clinical ce in infantile diseases, corrected by a care- y of the recent literature of the subject.—*Surg. Reporter*, April 5, 1879.

rcely necessary for us to say the work be- a standard work upon diseases of children, no work has a higher standing than it upon ctions. In consequence of its thorough re- he work has been made of more value than may be regarded as fully abreast of the We cordially commend it to students and s. There is no better work in the language s of children.—*Cincinnati Med. News*, 9.

hor has evidently determined that it shall und in the esteem of the profession for e latest knowledge on that important t of medicine. He has accordingly in- in the present edition the useful and results of the latest study and experience, ican and foreign, especially those bearing peutics. Altogether the book has been improved, while it has not been greatly d in size.—*New York Medical Journal*, 9.

This excellent work is so well known that an extended notice at this time would be superfluous. The author has taken advantage of the demand for another new edition to revise in a most careful manner the entire book; and the numerous corrections and additions evince a determination on his part to keep fully abreast with the rapid progress that is being made in the knowledge and treatment of children's diseases. By the adoption of a somewhat closer type, an increase in size of only thirty pages has been necessitated by the new subject matter introduced.—*Boston Med. and Surg. Jour.*, May 29, 1879.

Probably no other work ever published in this country upon a medical subject has reached such a heighth of popularity as has this well-known treatise. As a text and reference-book it is pre eminently the authority upon diseases of children. It stands deservedly higher in the estimation of the profession than any other work upon the same subject.—*Nashville Journ. of Med. and Surg.*, May, 1879.

The author of this work has acquired an immense experience as physician to three of the large charities of New York in which children are treated. These asylums afford unsurpassed opportunities for observing the effects of different plans of treatment, and the results as embodied in this volume may be accepted with faith, and should be in the possession of all practitioners *now*, in view of the approaching season when the diseases of children always increase. —*Nat Med. Review*, April, 1879.

THOMAS (T. GAILLARD), M.D.,

Professor of Obstetrics, &c., in the College of Physicians and Surgeons, N. Y., &c.

A PRACTICAL TREATISE ON THE DISEASES OF WOMEN. Fourth edition, enlarged and thoroughly revised. In one large and handsome octavo volume of 800 pages, with 191 illustrations. Cloth, $5 00; leather, $6 00. (*Just Issued.*)

The author has taken advantage of the opportunity afforded by the call for another edition of this work to render it worthy a continuance of the very remarkable favor with which it has been received. Every portion has been subjected to a conscientious revision, and no labor has been spared to make it a complete treatise on the most advanced condition of its important subject.

A work which has reached a fourth edition, and that, too, in the short space of five years, has achieved a reputation which places it almost beyond the reach of criticism, and the favorable opinions which we have already expressed of the former editions seem to require that we should do little more than announce this new issue. We cannot refrain from saying that, as a practical work, this is second to none in the English, or, indeed, in any other language. The arrangement of the contents, the admirably clear manner in which the subject of the differential diagnosis of several of the diseases is handled, leave nothing to be desired by the practitioner who wants a thoroughly clinical work, one to which he can refer in difficult cases of doubtful diagnosis with the certainty of gaining light and instruction. Dr Thomas is a man with a very clear head and decided views, and there seems to be nothing which he so much dislikes as hazy notions of diagnosis and blind routine and unreasonable therapeutics. The student who will thoroughly study this book and test its principles by clinical observation, will certainly not be guilty of these faults.—*London Lancet*, Feb. 13, 1875

Reluctantly we are obliged to close this unsatisfactory notice of so excellent a work, and in conclusion would remark that, as a teacher of gynæcology, both didactic and clinical, Prof. Thomas has certainly taken the lead far ahead of his *confrères*, and as an author he certainly has met with unusual and merited success.—*Am Journ. of Obstetrics*, Nov. 1874.

This volume of Prof. Thomas in its revised form is classical without being pedantic, full in the details of anatomy and pathology, without ponderous translation of pages of German literature, describes distinctly the details and difficulties of each operation, without wearying and useless minutiæ, and is in all respects a work worthy of confidence, justifying the high regard in which its distinguished author is held by the profession.—*Am. Supplement, Obstet. Journ.*, Oct. 1874.

Professor Thomas fairly took the Profession of the United States by storm when his book first made its appearance early in 1868. Its reception was simply enthusiastic, notwithstanding a few adverse criticisms from our transatlantic brethren, the first large edition was rapidly exhausted, and in six months a second one was issued, and in two years a third one was announced and published, and we are now promised the fourth. The popularity of this work was not ephemeral, and its success was unprecedented in the annals of American medical literature. Six years is a long period in medical scientific research, but Thomas's work on "Diseases of Women" is still the leading native production of the United States. The order, the matter, the absence of theoretical disputativeness, the fairness of statement, and the elegance of diction, preserved throughout the entire range of the book, indicate that Professor Thomas did not overestimate his powers when he conceived the idea and executed the work of producing a new treatise upon diseases of women.—PROF. PALLEN, in *Louisville Med. Journal*, Sept. 1874.

BARNES (ROBERT), M.D., F.R.C.P.,

Obstetric Physician to St. Thomas's Hospital, &c.

A CLINICAL EXPOSITION OF THE MEDICAL AND SURGICAL DISEASES OF WOMEN. Second American, from the Second Enlarged and Revised English Edition. In one handsome octavo volume, of 784 pages, with 181 illustrations. Cloth, $4 50; leather, $5 50. (*Just Ready.*)

The call for a new edition of Dr. Barnes's work on the Diseases of Females has encouraged the author to make it even more worthy of the favor of the profession than before. By a rearrangement and careful pruning space has been found for a new chapter on the Gynæcological Relations of the Bladder and Bowel Disorders, without increasing the size of the book, while many new illustrations have been introduced where experience has shown them to be needed. It is therefore hoped that the volume will be found to reflect thoroughly and accurately the present condition of gynæcological science.

Dr Barnes stands at the head of his profession in the old country, and it requires but scant scrutiny of his book to show that it has been sketched by a master. It is plain, practical common sense; shows very deep research without being pedantic; is eminently calculated to inspire enthusiasm without inculcating rashness; points out the dangers to be avoided as well as the success to be achieved in the various operations connected with this branch of medicine; and will do much to smooth the rugged path of the young gynæcologist and relieve the perplexity of the man of mature years.—*Canadian Journ. of Med. Science*, Nov. 1878.

We pity the doctor who, having any considerable practice in diseases of women, has no copy of "Barnes" for daily consultation and instruction. It is at once a book of great learning, research, and individual experience, and at the same time eminently practical. That it has been appreciated by the profession, both in Great Britain and in this country, is shown by the second edition following so soon upon the first.—*Am. Practitioner*, Nov. 1878.

Dr. Barnes's work is one of a practical character, largely illustrated from cases in his own experience, but by no means confined to such, as will be learned from the fact that he quotes from no less than 628 medical authors in numerous countries. Coming from such an author, it is not necessary to say that the work is a valuable one, and should be largely consulted by the profession.—*Am. Supp Obstetrical Journ. Gt. Britain and Ireland*, Oct. 1878.

No other gynæcological work holds a higher position, having become an authority everywhere in diseases of women. The work has been brought fully abreast of present knowledge. Every practitioner of medicine should have it upon the shelves of his library, and the student will find it a superior text-book.—*Cincinnati Med. News*, Oct. 1878.

This second revised edition, of course, deserves all the commendation given to its predecessor, with the additional one that it appears to include all or nearly all the additions to our knowledge of its subject that have been made since the appearance of the first edition. The American references are, for an English work, especially full and appreciative, and we can cordially recommend the volume to American readers.—*Journ. of Nervous and Mental Disease*, Oct. 1878.

This second edition of Dr. Barnes's great work comes to us containing many additions and improvements which bring it up to date in every feature. The excellences of the work are too well known to require enumeration, and we hazard the prophecy that they will for many years maintain its high position as a standard text-book and guide book for students and practitioners.—*N. C. Med. Journ.*, Oct. 1878.

MMET (THOMAS ADDIS), M.D.

Surgeon to the Woman's Hospital, New York, etc.

HE PRINCIPLES AND PRACTICE OF GYNÆCOLOGY, for the
**se of Students and Practitioners of Medicine. Second Edition. Thorougly Revised.

PREFACE TO THE SECOND EDITION.

unusually rapid exhaustion of a large edition of this work, while flattering to the author
evidence that his labors have proved acceptable, has in a great measure heightened his
of responsibility. He has therefore endeavored to take full advantage of the opportunity
d to him for its revision. Every page has received his earnest scrutiny; the criticisms
reviewers have been carefully weighed; and while no marked increase has been made in
of the volume, several portions have been rewritten, and much new matter has been
In this minute and thorough revision, the labor involved has been much greater than
ps apparent in the results, but it has been cheerfully expended in the hope of rendering
k more worthy of the favor which has been accorded to it by the profession.
tice of the previous edition is appended.

rves and will receive the careful study of
desire to keep on a level with the progress of
logy. It embodies a larger amount of care-
alyzed personal experience in a unique field
rvation than any volume on Diseases of
which has yet been published. Its great
sists in this—coming as it does from a
ly honest, competent. and able specialist,
me a specialist only after an excellent
and experience as a general hospital phy-
surgeon. The book is not one to be hastily
ever, but will secure the critical study of
gists. Not only its style, which is individual and somewhat peculiar, but the new facts
which it brings out, its original suggestions, its
numerous and important statistical tables, and, in
some instances, its unexpected deductions, will
compel attention, and will form the basis for a
great deal of Gynæcological study and literature
in the future. All who make themselves familiar
with the contents of this volume, will feel assured
that Dr Emmet has well earned and well deserved
the reputation which he has already won, as one of
the great Gynæcologists of the present age.—*The
Am. Journ. of Obstetrics*, April, 1879.

Third American edition, revised by the author. Edited, with additions, by Ro HARRIS, M.D. In one handsome octavo volume of about 700 pages, with ne illustrations. Cloth, $4; leather, $5 (*Just Ready*)

EXTRACT FROM THE AUTHOR'S PREFACE.

The second American edition of my work on Midwifery being exhausted before the sponding English edition, I cannot better show my appreciation of the kind reception has received in the United States than by acceding to the publisher's request that I myself undertake the issue of a third edition. As little more than a year has ela the second edition was issued, there are naturally not many changes to make, but I nevertheless, subjected the entire work to careful revision, and introduced into it a n most of the more important recent additions to obstetric science. To the operation of elytrotomy—formerly described along with the Cæsarean section—I have now devoted rate chapter. The editor of the Second American edition, Dr. Harris, enriched it wi valuable notes, of which, it will be observed, I have freely availed myself.

The medical profession has now the opportunity of adding to their stock of standard medical works one of the best volumes on midwifery ever published. The subject is taken up with a master hand. The part devoted to labor in all its various presentations, the management and results, is admirably arranged, and the views entertained will be found essentially modern, and the opinions expressed trustworthy. The work abounds with plates, illustrating various obstetrical positions; they are admirably wrought, and afford great assistance to the student.—*N. O. Med. and Surg. Journ.*, March, 1880.

If inquired of by a medical student what obstetrics we should recommend for him, *excellence*, we would undoubtedly advise choose Playfair's. It is of convenient size, is of chief importance, its treatment of the subjects is concise and plain. While the di and descriptions are sufficiently elaborate a very intelligent idea of them, yet all de necessary for a full understanding of the su omitted.—*Cincinnati Med. News*, Jan. 1880.

BARNES (*FANCOURT*), *M.D.*,

Physician to the General Lying-in Hospital, London.

of operations and the different modes of
performing them. The work is handsomely illustrated, and the descriptions are clear and well drawn. It is a clever and useful volume; every student should possess one. The preparation of this work does away with the necessity of pondering over larger works on surgery for descriptions of operations, as it presents in a nut-shell just what is wanted by the surgeon without an elaborate search to find it.—*Md. Med Journal*, Aug. 1878.

The author's conciseness and the repleteness of the work with valuable illustrations entitle it to be classed with the text-books for students of operative surgery, and as one of reference to the practitioner.—*Cincinnati Lancet and Clinic*, July 27, 1878.

GROSS (SAMUEL D.), M.D.,

Professor of Surgery in the Jefferson Medical College of Philadelphia.

SYSTEM OF SURGERY: Pathological, Diagnostic, Thera

and Operative. Illustrated by upwards of Fourteen Hundred Engravings. Fifth
carefully revised, and improved. In two large and beautifully printed imperial oc
umes of about 2300 pp., strongly bound in leather, with raised bands, $15. (*Just*

The continued favor, shown by the exhaustion of successive large editions of this gre
proves that it has successfully supplied a want felt by American practitioners and stude
the present revision no pains have been spared by the author to bring it in every resp
up to the day. To effect this a large part of the work has been rewritten, and the w
arged by nearly one-fourth, notwithstanding which the price has been kept at its for
moderate rate. By the use of a close, though very legible type, an unusually large a
matter is condensed in its pages, the two volumes containing as much as four or five
octavos. This, combined with the most careful mechanical execution, and its very dura
ing renders, it one of the cheapest works accessible to the profession. Every subject
belonging to the domain of surgery is treated in detail, so that the student who pos
work may be said to have in it a surgical library.

We have now brought our task to a conclusion, and have seldom read a work with the practical value of which we have been more impressed. Every chapter is so concisely put together, that the busy practitioner, when in difficulty, can at once find the information he requires. His work, on the contrary, is cosmopolitan, the surgery of the world being fully represented in it. The work, in fact, is so historically unprejudiced, and so eminently practical, that it is almost a false compliment to say that we believe it to be destined to occupy a foremost place as a work of reference, while a system of surgery like the present system of surgery is the practice of surgeons. The printing and binding of the work is unexceptionable; indeed, it contrasts, in the latter respect, remarkably with English medical and surgical cloth-bound publications, which are generally so wretchedly stitched as to require re-binding before they are any time in use.—*Dub. Journ. of Med. Sci.*, March, 1874.

Dr. Gross's Surgery, a great work, has become still greater, both in size and merit, in its most recent form. The difference in actual number of pages is not more than 130, but, the size of the page having been increased to what we believe is technically termed "elephant," there has been room for considerable additions, which, together with the alterations, are improvements.—*Lond. Lancet*, Nov. 16, 1872.

It combines, as perfectly as possible, the qualities of a text-book and work of reference. We think this last edition of Gross's "Surgery," will confirm

BY THE SAME AUTHOR.

A PRACTICAL TREATISE ON THE DISEASES, INJU

and Malformations of the Urinary Bladder, the Prostate Gland, and the Ureth
Edition, thoroughly Revised and Condensed, by SAMUEL W. GROSS, M.D., S
the Philadelphia Hospital. In one handsome octavo volume of 574 pages, with
trations: cloth, $4 50. (*Just Issued.*)

For reference and general information, the physician or surgeon can find no work that meets their necessities more thoroughly than this, a revised edition of an excellent treatise, and no medical library should be without it. Replete with handsome illustrations and good ideas, it has the unusual advantage of being easily comprehended, by the reasonable and practical manner in which the various subjects are systematized and arranged. We heartily recommend it to the profession as a valuable addition to the important literature of diseases of the urinary organs.—*Atlanta Med.*
1876.

It is with pleasure we now again take
work in a decidedly new dress. Indeed, it
garded as a new book in very many of its
chapters on "Diseases of the Bladder,"
Body," and "Lithotomy," are splendid s
descriptive writing; while the chapter on
is one of the most concise and clear that w
read.—*New York Med. Journ.*, Nov. 1876.

moreover, possesses the inestimable adva
having the subjects perfectly well arran
classified and of being written in a style
clear and succinct.—*Am. Journal of Med. S*

HURST (JOHN, Jr.), M.D.,

Prof. of Clinical Surgery, Univ of Pa., Surgeon to the Episcopal Hospital, Philadelphia.

E PRINCIPLES AND PRACTICE OF SURGERY. Second

tion, enlarged and revised. In one very large and handsome octavo volume of over pages, with 542 illustrations. Cloth, $6; leather, $7. (*Just Ready.*)

diousness and thoroughness are two very alis of character in the author of this t of these traits largely has grown the his mental fruit in the past, and the pre- eems in no wise an exception to what has e. The general arrangement of the vol- ame as in the first edition, but every part carefully revised, and much new matter *hila. Med. Times*, Feb. 1, 1879.

previously spoken of Dr. Ashhurst's ms of praise. We wish to reiterate those , and to add that no more satisfactory tion of modern surgery has yet fallen press. In point of judicial fairness, of ondensation, of accuracy and conciseness ion and thoroughly good English, Prof. s no superior among the surgical writers .—*Am. Practitioner*, Jan. 1879.

pt to embrace in a volume of 1000 pages field of surgery, general and special, hopeless task unless through the most ustry in collating and arranging, and judgment in condensing and excluding. ies have been abundantly employed by , and he has given us a most excellent ght up by the revision for the second e latest date. Of course this book is not specialists, but as a course of general wledge and for general practitioners, book for students it is not surpassed s yet appeared, whether of home or rship.—*N. Carolina Med. Journal*,

Ashhurst's Surgery is too well known in this country to require special commendation from us. This, its second edition, enlarged and thoroughly revised, brings it nearer our idea of a model text-book than any recently published treatise. Though numerous additions have been made, the size of the work is not materially increased. The main trouble of text books of modern times is that they are too cumbersome. The student needs a book which will furnish him the most information in the shortest time. In every respect this work of Ashhurst is the model text-book - full, comprehensive and compact.—*Nashville Jour. of Med. and Surg.*, Jan. '79.

The favorable reception of the first edition is a guarantee of the popularity of this edition, which is fresh from the editor's hands with many enlargements and improvements. The author of this work is deservedly popular as an editor and writer, and his contributions to the literature of surgery have gained for him wide reputation. The volume now offered the profession will add new laurels to those already won by previous contributions. We can only add that the work is well arranged, filled with practical matter, and contains in brief and clear language all that is necessary to be learned by the student of surgery whilst in attendance upon lectures, or the general practitioner in his daily routine practice.—*Md. Med. Journal*, Jan. 1879.

The fact that this work has reached a second edition so very soon after the publication of the first one, speaks more highly of its merits than anything we might say in the way of commendation. It seems to have immediately gained the favor of students and physicians.—*Cincin. Med. News*, Jan. '79.

NT (THOMAS), F.R.C.S.,

rgeon to Guy's Hospital.

PRACTICE OF SURGERY. Second American, from the Sec-

and Revised English Edition. With Six Hundred and Seventy-two Engravings on d. In one large and very handsome imperial octavo volume of over 1000 large and ly printed pages. Cloth, $6; leather, $7. (*Just Ready.*)

t has enjoyed the advantage of two thorough revisions at the hand of the author since ance of the first American edition, resulting in a very notable enlargement of size and t of matter. In England this has led to the division of the work into two volumes, ere comprised in one, the size being increased to a large imperial octavo, printed on d but clear type. The series of illustrations has undergone a like revision, and will rrespondingly improved.

ed success of the work on both sides of the Atlantic shows that the author has succeeded in the effort to give to student and practitioner a sound and trustworthy guide in the Surgery; while the simultaneous appearance of the present edition in England and ntry affords to the American reader the benefit of the most recent advances made rgical science.

many text-books of surgery, so many lled and distinguished hands, that to ob of a third edition in England is no light ryant merits this, by clearness of style, gment in selecting the operations he re- his new editions he goes carefully over ds, in light of later research. On these llied points, Mr. Bryant is a calm and un- erver, and his book throughout has the of maintaining the true scientific, judicial .—*Med. and Surg. Reporter*, March 22,

before us is the American reprint of the edition, and has the advantage over the g of more convenient size, and in being nto one volume. The author has rewrit- ter part of the work, and has succeeded, t of new matter added, in making it mark- ive from previous editions. A few extra been added, and also a few new illustrations The publishers have presented the work le style. As a concise and practical manual rgery it is perhaps without an equal, and always be a favorite text-book with the practitioner.—*N. Y. Med. Record*, March

Another edition of this manual having been called for, the author has availed himself of the opportunity to make no few alterations in the substance as well as in the arrangement of the work, and, with a view to its improvement, has recast the materials and revised the whole. We ourselves are of the opinion that there is no better work on surgery extant.—*Cincinnati Med. News*, March, 1879.

Bryant's Surgery has been favorably received from the first, and evidently grows in the esteem of the profession with each succeeding edition. In glancing over the volume before us we find proof in almost every chapter of the thorough revision which the work has undergone, many parts having been cut out and replaced by matter entirely fresh.—*N. Y. Med. Journ.*, April, 1879.

Welcome as the new edition is, and as much as it is entitled to commendation, yet its appearance at this time is, in a certain sense, a matter of regret, as it will be in competition with another work, lately issued from the same press. But, the difficult task of forming a judgment as to the relative merits of Bryant and Ashhurst we will not attempt, but predict that, considering the high excellence of both, many others will likewise be forced to hesitate long in making choice between them.—*Cincinnati Lancet and Clinic*, March 22, 1879.

ERICHSEN (JOHN E.),

Professor of Surgery in University College, London, etc.

THE SCIENCE AND ART OF SURGERY; being a Treatise o
gical Injuries, Diseases, and Operations. Carefully revised by the author fr
Seventh and enlarged English Edition. Illustrated by eight hundred and sixty
gravings on wood. In two large and beautiful octavo volumes of nearly 2000
cloth, $8 50; leather, $10 50. (*Now Ready.*)

In revising this standard work the author has spared no pains to render it worthy of a
ance of the very marked favor which it has so long enjoyed, by bringing it thoroug
level with the advance in the science and art of surgery made since the appearance
last edition. To accomplish this has required the addition of about two hundred pages
while the illustrations have undergone a marked improvement. A hundred and fifty
wood-cuts have been inserted, while about fifty other new ones have been substituted fo
which were not deemed satisfactory. In its enlarged and improved form it is theref
sented with the confident anticipation that it will maintain its position in the front
text-books for the student, and of works of reference for the practitioner, while its ex
moderate price places it within the reach of all.

The seventh edition is before the world as the last word of surgical science. There may be monographs which excel it upon certain points, but as a conspectus upon surgical principles and practice it is unrivalled. It will well reward practitioners to read it, for it has been a peculiar province of Mr Erichsen to demonstrate the absolute interdependence of medical and surgical science We need scarcely add, in conclusion, that we heartily commend the work to students that they may be grounded in a sound faith, and to practitioners as an invaluable guide at the bedside.—*Am. Practitioner*, April, 1878.

It is no idle compliment to say that this is the best edition Mr. Erichsen has ever produced of his well-known book. Besides inheriting the virtues of its predecessors, it possesses excellences quite its own. Having stated that Mr. Erichsen has incorporated into this edition every recent improvement in the science and art of surgery, it would be a supererogation to give a detailed criticism. In short, we unhesitatingly aver that we know of no other single work where the student and practitioner can gain at once so clear an insight into the principles of surgery, and so complete a knowledge of the exigencies of surgical practice.—*London Lancet*, Feb. 14, 1878

For the past twenty years Erichsen's Surgery has maintained its place as the leading text-book, not only in this country, but in Great Britain. That it is able to hold its ground, is abundantly proven by the thoroughness with which the present edition has been revised, and by the large amount of valuable material that has been added. Aside from this, one hundred and fifty new illustrations have been inserted, including quite a number of microscopical appearances of pathological processes. So marked is this change for the better, that the work almost appears as an entirely new one.—*Med. Record*, Feb. 23, 1878.

Of the many treatises on Surgery which it
our task to study, or our pleasure to read, th
which in all points has satisfied us so well as
treatise of Erichsen. His polished, clear styl
dom from prejudice and hobbies, his unsurp
of his subject, and vast clinical experience, q
admirably to write a model text-book. Wh
at the least cost of time, to learn the most of
surgery, we turn, by preference, to his work
pleasure, therefore, to see that the apprecia

HOLMES (TIMOTHY), M.D.,

Surgeon to St. George's Hospital, London.

SURGERY, ITS PRINCIPLES AND PRACTICE. In one
some octavo volume of nearly 1000 pages, with 411 illustrations. Cloth, $6; le
(*Just Issued.*)

This is a work which has been looked for on both sides of the Atlantic with much interest. Mr. Holmes is a surgeon of large and varied experience, and one of the best known, and perhaps the most brilliant writer upon surgical subjects in England. It is a book for students—and an admirable one—and for the busy general practitioner. It will give a student all the knowledge needed to pass a rigid examination. The book fairly justifies the high expectations that were formed of it. Its style is clear and forcible, even brilliant at times, and the conciseness needed to bring it within its proper limits has not impaired its force and distinctness.—*N. Y. Med. Rec*
14, 1876.

It will be found a most excellent epito
gery by the general practitioner who h
time to give attention to more minute and
works and to the medical student. In fact,
of no one we can more cordially recomm
author has succeeded well in giving a
practical account of each surgical injury
ease, and of the treatment which is
monly advisable. It will no doubt becom
lar work in the profession, and especially
book.—*Cincinnati Med. News*, April, 1

HAMILTON (FRANK H.), M.D.,

Professor of Fractures and Dislocations, &c., in Bellevue Hosp. Med. College, New York.

A PRACTICAL TREATISE ON FRACTURES AND DISLOCATIONS.

Fifth edition, revised and improved. In one large and handsome octavo volume of nearly 800 pages, with 344 illustrations. Cloth, $5 75; leather, $6 75. (*Lately Issued.*)

This work is well known, abroad as well as at home, as the highest authority on its important subject—an authority recognized in the courts as well as in the schools and in practice—and again manifested, not only by the demand for a fifth edition, but by arrangements now in progress for the speedy appearance of a translation in Germany. The repeated revisions which the author has thus had the opportunity of making have enabled him to give the most careful consideration to every portion of the volume, and he has sedulously endeavored in the present issue, to perfect the work by the aid of his own enlarged experience, and to incorporate in it whatever of value has been added in this department since the issue of the fourth edition. It will therefore be found considerably improved in matter, while the most careful attention has been paid to the typographical execution, and the volume is presented to the profession in the confident hope that it will more than maintain its very distinguished reputation.

There is no better work on the subject in existence than that of Dr. Hamilton. It should be in the possession of every general practitioner and surgeon.—*The Am. Journ. of Obstetrics*, Feb. 1876.

The value of a work like this to the practical physician and surgeon can hardly be over-estimated, and the necessity of having such a book revised to the latest dates, not merely on account of the practical importance of its teachings, but also by reason of the medico-legal bearings of the cases of which it treats, and which have recently been the subject of useful papers by Dr. Hamilton and others, is sufficiently obvious to every one. The present volume seems to amply fill all the requisites. We can safely recommend it as the best of its kind in the English language, and not excelled in any other. *Journ. of Nervous and Mental Disease*, Jan. 1876.

BROWNE (EDGAR A.),

Surgeon to the Liverpool Eye and Ear Infirmary, and to the Dispensary for Skin Diseases.

HOW TO USE THE OPHTHALMOSCOPE.

Being Elementary Instructions in Ophthalmoscopy, arranged for the Use of Students. With thirty-five illustrations. In one small volume royal 12mo. of 120 pages: cloth, $1. (*Now Ready.*)

NETTLESHIP (EDWARD), F.R.C.S.,

Ophthalmic Surg. and Lect. on Ophth. Surg. at St. Thomas' Hospital, London.

MANUAL OF OPHTHALMIC MEDICINE.

In one royal 12mo. volume of over 350 pages, with 89 illustrations. Cloth, $2. (*Just Ready.*)

The book is written in a careful and logical manner, and though extremely concise, we have failed to notice any evidence of ambiguity. It is rendered more compact and homogeneous by frequent references, by page number, to other portions of the work; repetitions are thus avoided, and we have been surprised to find how much information our author has succeeded in conveying in so small a space. A careful study of the book will well repay the general practitioner, even though it should serve only as a monitor. It is particularly useful in the latter regard, as the subject of treatment is presented in a thoroughly conservative manner.—*N. Y. Med. Record*, March 6, 1880.

The author has succeeded in touching upon about all the points, operations, diseases of the eye in relation to general diseases, and has prepared a very acceptable book.—*Cincinnati Lancet and Clinic*, Feb. 7, 1880.

We are sure he has produced a useful volume. Its eighty-nine illustrations add much to its attractiveness. Full directions for examining the eye are given. The descriptions of the various operations and suggestions for local and surgical treatment, and the etiology of eye diseases, are done full justice to. —*Louisville Med. News*, Jan 1880.

It is *multum in parvo*, containing all the leading points to be remembered in the pathology, description, and treatment of diseases of the eye. It will be found especially valuable in preparing for examinations. Practitioners will find it convenient as a work of reference, when they wish to refresh their memories in respect to the features of some affections.—*Cincinnati Med. News*, Jan. 1880.

CARTER (R. BRUDENELL), F.R.C.S.,

Ophthalmic Surgeon to St. George's Hospital, etc.

A PRACTICAL TREATISE ON DISEASES OF THE EYE.

Edited, with test-types and Additions, by JOHN GREEN, M.D. (of St. Louis, Mo.). In one handsome octavo volume of about 500 pages, and 124 illustrations. Cloth, $3 75. (*Just Issued.*)

It is with great pleasure that we can endorse the work as a most valuable contribution to practical ophthalmology. Mr. Carter never deviates from the end he has in view, and presents the subject in a clear and concise manner, easy of comprehension, and hence the more valuable. We would especially commend, however, as worthy of high praise, the manner in which the therapeutics of disease of the eye is elaborated, for here the author is particularly clear and practical, where other writers are unfortunately too often deficient. The final chapter is devoted to a discussion of the uses and selection of spectacles, and is admirably compact, plain, and useful, especially the paragraphs on the treatment of presbyopia and myopia. In conclusion, our thanks are due the author for many useful hints in the great subject of ophthalmic surgery and therapeutics, a field where of late years we glean but a few grains of sound wheat from a mass of chaff.—*New York Medical Record*, Oct. 23, 1875.

WELLS (J. SOELBERG),

Professor of Ophthalmology in King's College Hospital, &c.

A TREATISE ON DISEASES OF THE EYE.

Third American, from the Fourth and Revised London Edition, with additions; illustrated with numerous engravings on wood, and six colored plates. Together with selections from the Test-types of Jaeger and Snellen. In one large and very handsome octavo volume. (*Preparing.*)

LAURENCE'S HANDY BOOK OF OPHTHALMIC SURGERY, for the use of Practitioners. Second edition, revised and enlarged. With numerous illustrations. In one very handsome octavo volume, cloth, $2 75.

LAWSON'S INJURIES TO THE EYE, ORBIT, AND EYELIDS: their Immediate and Remote Effects. With about one hundred illustrations. In one very handsome octavo volume, cloth. $3 50.

BURNETT (CHARLES H.), M.A , M.D.,

Aural Surg to the Presb. Hosp., Surgeon-in-charge of the Infir for Dis. of the Ear, Ph

THE EAR, ITS ANATOMY, PHYSIOLOGY, AND DISEA

A Practical Treatise for the Use of Medical Students and Practitioners. In one h some octavo volume of 615 pages, with eighty-seven illustrations: cloth, $4 50; le $5 50. (*Now Ready.*)

Recent progress in the investigation of the structures of the ear, and advances made i modes of treating its diseases, would seem to render desirable a new work in which all t sources of the most advanced science should be placed at the disposal of the practitioner. it has been the aim of Dr. Burnett to accomplish, and the advantages which he has enjo the special study of the subject are a guarantee that the result of his labors will prove of se to the profession at large, as well as to the specialist in this department.

Foremost among the numerous recent contributions to aural literature will be ranked this work of Dr. Burnett. It is impossible to do justice to this volume of over 600 pages in a necessarily brief notice. It must suffice to add that the book is profusely and accurately illustrated, the references are conscientiously acknowledged, while the result has been to produce a treatise which will henceforth rank with the classic writings of Wilde and Von Trölsch.—*The Lond. Practitioner*, May, 1879

On account of the great advances which have been made of late years in otology, and of the increased interest manifested in it, the medical profession will welcome this new work, which presents clearly and concisely its present aspect, whilst clearly indicating the direction in which further researches can be most profitably carried on. Dr. Burnett from his own matured experience, and availing himself of the observations and discoveries of others, has produced a work, which as a text-book, stands *facile princeps* in our language. We had marked several passages as well worthy of quotation and the attention of the general practitioner, but their number and the space at our command forbid. Perhaps it is better, as the book ought to be in the hands of every medical student, and its study will well re busy practitioner in the pleasure he will deriv the agreeable style in which many otherwi and mostly unknown subjects are treated. specialist the work is of the highest value, a sense of gratitude to Dr. Burnett will we h proportionate to the amount of benefit he can from the careful study of the book, and a reference to its trustworthy pages.—*Edi Med. Jour.*, Aug. 1878.

The book is designed especially for the use dents and general practitioners, and places a disposal much valuable material. Such a b the present one, we think, has long been need we may congratulate the author on his suc filling the gap. Both student and practitio study the work with a great deal of benefit. profusely and beautifully illustrated.—*N. pital Gazette*, Oct 15, 1877.

Dr. Burnett is to be commended for having the best book on the subject in the English la and especially for the care and attention given to the scientific side of the subject.— *Med. Journ.*, Dec. 1877.

TAYLOR (ALFRED S.), M.D.,

Lecturer on Med. Jurisp. and Chemistry in Guy's Hospital.

POISONS IN RELATION TO MEDICAL JURISPRUDENCE MEDICINE.

Third American, from the Third and Revised English Edition. large octavo volume of 850 pages; cloth, $5 50; leather, $6 50. (*Just Issued.*)

The present is based upon the two previous editions; "but the complete revision rendered necessary by time has converted it into a new work." This statement from the preface contains all that it is desired to know in reference to the new edition. The works of this author are already in the library of every physician who is liable to be called upon for medico-legal testimony (and what one is not?), so that all that is required to be known about the present book is that the author has kept it abreast with the times. What makes it now, as always, especially valuable to the practitioner is its conciseness and practical character, only those poisonous substances being described which give rise to legal ia tions.—*The Clinic*, Nov. 6, 1875.

Dr. Taylor has brought to bear on the com of this volume, stores of learning, experie practical acquaintance with his subject, prob beyond what any other living authority on t ogy could have amassed or utilized. He ha sustained his reputation by the consumma and legal acumen he has displayed in the ar ment of the subject-matter, and the result is on Poisons which will be indispensable to eve dent or practitioner in law and medicine.—*T lin Journ. of Med. Sci.*, Oct. 1875.

BY THE SAME AUTHOR.

MEDICAL JURISPRUDENCE. Seventh American Edition. Ed

by JOHN J. REESE, M.D., Prof of Med. Jurisp. in the Univ. of Penn. In one octavo volume of nearly 900 pages. Cloth, $5 00; leather, $6 00. (*Lately Is*

To the members of the legal and medical profession, it is unnecessary to say anything commendatory of Taylor's Medical Jurisprudence. We might as well undertake to speak of the merit of Chitty's Pleadings.—*Chicago Legal News*, Oct. 16, 1873.

It is beyond question the most attractive as well as most reliable manual of medical jurisprudence published in the English language.—*Am. Journal of Syphilography*, Oct. 1873.

It is altogether superfluous for us to offer anything in behalf of a work on medical jurisprudence by an author who is almost universally esteemed to be the best authority on this specialty in our langua this point, however, we will say that we consid Taylor to be the safest medico-legal authority low, in general, with which we are acquainted i language.—*Va. Clin. Record*, Nov. 1873.

This last edition of the Manual is probably the of all, as it contains more material and is worke to the latest views of the author as expressed i last edition of the Principles. Dr. Reese, the e of the Manual, has done everything to mak work acceptable to his medical countrymen.— *Med. Record*, Jan. 15, 1874.

BY THE SAME AUTHOR.

THE PRINCIPLES AND PRACTICE OF MEDICAL JURISPR DENCE.

Second Edition, Revised, with numerous Illustrations. In two large oct volumes, cloth, $10 00; leather, $12 00.

This great work is now recognized in England as the fullest and most authoritative treati every department of its important subject. In laying it, in its improved form, before the A ican profession, the publisher trusts that it will assume the same position in this country.

OBERTS (WILLIAM), M.D.,

Lecturer on Medicine in the Manchester School of Medicine, etc.

PRACTICAL TREATISE ON URINARY AND RENAL DIS-
ASES, including Urinary Deposits. Illustrated by numerous cases and engravings. Third
merican, from the Third Revised and Enlarged London Edition. In one large and
andsome octavo volume of over 600 pages. Cloth, $4. (*Just Ready.*)

OMPSON (SIR HENRY),

Surgeon and Professor of Clinical Surgery to University College Hospital.

ECTURES ON DISEASES OF THE URINARY ORGANS. With
illustrations on wood. Second American from the Third English Edition. In one neat
octavo volume. Cloth, $2 25. (*Just Issued.*)

HE SAME AUTHOR.

THE PATHOLOGY AND TREATMENT OF STRICTURE OF
THE URETHRA AND URINARY FISTULÆ. With plates and wood-cuts. From the
third and revised English edition. In one very handsome octavo volume, cloth, $3 50.
(*Lately Published.*)

E (DANIEL HACK), M.D.,

Joint author of "The Manual of Psychological Medicine," &c.

LUSTRATIONS OF THE INFLUENCE OF THE MIND UPON
HE BODY IN HEALTH AND DISEASE. Designed to illustrate the Action of the
magination. In one handsome octavo volume of 416 pages, cloth, $3 25. (*Lately Issued.*)

NDFORD (G. FIELDING), M.D., F.R.C.P.,

Lecturer on Psychological Medicine at the School of St. George's Hospital, &c.

ANITY AND ITS TREATMENT: Lectures on the Treatment,
edical and Legal, of Insane Patients. With a Summary of the Laws in force in the
ited States on the Confinement of the Insane. By ISAAC RAY, M. D. In one very
ndsome octavo volume of 471 pages; cloth, $3 25.

es a want which must have been sorely
busy general practitioners of this country.
the form of a manual of clinical description
rious forms of insanity, with a description
de of examining persons suspected of in-
We call particular attention to this feature
k, as giving it a unique value to the gene-
ioner. If we pass from theoretical conside-
descriptions of the varieties of insanity as actually seen in practice and the appropriate treatment for them, we find in Dr. Blandford's work a considerable advance over previous writings on the subject. His pictures of the various forms of mental disease are so clear and good that no reader can fail to be struck with their superiority to those given in ordinary manuals in the English language or (so far as our own reading extends) in any other.—*London Practitioner*, Feb. 1871.

(HENRY C.).

PERSTITION AND FORCE: ESSAYS ON THE WAGER OF
AW, THE WAGER OF BATTLE, THE ORDEAL, AND TORTURE. Third Revised
d Enlarged Edition. In one handsome royal 12mo. volume of 552 pages. Cloth,
2 50. (*Just Ready.*)

pearance of a new edition of Mr. Henry C.
perstition and Force" is a sign that our
cholarship is not without honor in its na-
try. Mr. Lea has met every fresh demand
rk with a careful revision of it, and the
ition is not only fuller and, if possible,
rate than either of the preceding, but,
thorough elaboration is more like a har-
ncert and less like a batch of studies.—
, Aug. 1, 1878.

ill be tempted to say that this, like the
nd Fall," is one of the uncriticizable books
re innumerable, its deductions simple and
. and its *chevaux-de-frise* of references
and dense enough to make the keenest,
, and best equipped assailant think twice
dvancing. Nor is there anything contro-
in it to provoke assault. The author is no polemic. Though he obviously feels and thinks strongly, he succeeds in attaining impartiality. Whether looked on as a picture or a mirror, a work such as this has a lasting value.—*Lippincott's Magazine*, Oct. 1878.

Mr. Lea's curious historical monographs, of which one of the most important is here reproduced in an enlarged form, have given him an unique position among English and American scholars. He is distinguished for his recondite and affluent learning, his power of exhaustive historical analysis, the breadth and accuracy of his researches among the rarer sources of knowledge, the gravity and temperance of his statements, combined with singular earnestness of conviction, and his warm attachment to the cause of human freedom and intellectual progress.—*N. Y. Tribune*, Aug. 9, 1878.

E SAME AUTHOR. (*Lately Published.*)

UDIES IN CHURCH HISTORY—THE RISE OF THE TEMPORAL POWER—BENEFIT OF CLERGY—EXCOMMUNICATION. In one large
royal 12mo. volume of 516 pp.; cloth, $2 75.

story was never told more calmly or with
learning or wiser thought. We doubt, indeed,
ether study of this field can be compared with
clearness, accuracy, and power.—*Chicago*
er, Dec. 1870.

ea's latest work, "Studies in Church History,"
sustains the promise of the first. It deals with
subjects—the Temporal Power, Benefit of
, and Excommunication, the record of which has a peculiar importance for the English student, and is a chapter on Ancient Law likely to be regarded as final. We can hardly pass from our mention of such works as these—with which that on "Sacerdotal Celibacy" should be included—without noting the literary phenomenon that the head of one of the first American houses is also the writer of some of its most original books.—*London Athenæum*, Jan. 7, 1871.

DALTON'S PHYSIOLOGY—Lately Issued.

EATISE ON HUMAN PHYSIOLOGY. Designed for the use of Students and Practiioners of Medicine. By J. C. Dalton, M.D., Professor of Physiology in the College of hysicians and Surgeons in New York, etc. Sixth edition, revised and enlarged. With 16 illustration on wood. In one very beautiful octavo volume of 830 pages. Cloth, 5 50; leather, $6 50.

Dalton has discussed conflicting theories and sions regarding physiological questions with fulness, and a conciseness which lend nd vigor to the entire book. But his dishave been so guarded by a refusal of adto those speculative and theoretical explawhich at best exist in the minds of observers as only probabilities, that none of his need be led into grave errors while making study.—*The Medical Record*, Feb. 19, 1876.

The style is clear, the arrangement admirable, and the figures excellent. Though much increased in bulk, it is still a moderate-sized volume. Every chapter bears evidence of a careful revision and all the most important and trustworthy facts of recent physiological science have been incorporated.—*Canada Med. and Surg. Journ.*, Jan. 1876.

Every one concedes that this is the best physiological text-book published in America.—*Va. Med. Monthly*, Jan. 1876.

ELLIS'S DEMONSTRATIONS OF ANATOMY—Now Ready.

NSTRATIONS OF ANATOMY, being a Guide to the Knowledge of the Human Body Dissection. By George Viner Ellis, Emeritus Professor of Anatomy in University llege, London. From the eighth and revised London edition. In one very handsome tavo volume of over 700 pages, with 248 illustrations. Cloth, $4 25; leather, $5 25.

practitioner especially, who has surgical to perform, it will be of even more imservice than the recognized systematic Of course we most unreservedly recommend practitioner of medicine who can possi—*Va. Med. Monthly*, June, 1879.

e been highly interested in examining this The high estimate in which it is held by in England is shown by the fact that it has ached its eighth English edition. It is designed chiefly as a dissecting *vade mecum*, and as such it has few equals. We must congratulate the distinguished author on the selection of his plates. They are clear, large, and readily studied, being equal, if not superior, to the celebrated cuts in Gray's Anatomy. We shall recommend it to our own students as a text-book, and commend it to students generally, as an invaluable guide in their anatomical studies.—*Nashville Journ. of Med. and Surg.*, Sept. 1879.

ABERSHON ON THE ALIMENTARY CANAL—New Edition—Now Ready.

DISEASES OF THE ABDOMEN, COMPRISING THOSE OF THE STOMACH, other parts of the Alimentary Canal, Œsophagus, Cæcum, Intestines, and Peritoneum. O. Habershon, M.D., Senior Physician to and late Lecturer on the Principles and tice of Medicine at Guy's Hospital, etc. Second American, from the third enlarged revised English edition. With illustrations. In one handsome octavo volume of over pages. Cloth, $3 50.

able treatise on diseases of the stomach men has been out of print for several years, efore not so well known to the profession ves to be. It will be found a cyclopædia tion, systematically arranged, on all dise alimentary tract, from the mouth to the A fair proportion of each chapter is devoted oms, pathology, and therapeutics. The dition is fuller than former ones in many s, and has been thoroughly revised and amended by the author. Several new chapters have been added, bringing the work fully up to the times, and making it a volume of interest to the practitioner in every field of medicine and surgery. Perverted nutrition is in some form associated with all diseases we have to combat, and we need all the light that can be obtained on a subject so broad and general. Dr Habershon's work is one that every practitioner should read and study for himself.—*N. Y. Med. Journ.*, April, 1879.

FARQUHARSON'S THERAPEUTICS—Just Ready.

E TO THERAPEUTICS AND MATERIA MEDICA. By Robert Farquharson, turer on Materia Medica in St. Mary's Hospital Medical School. Second American ion, revised by the author. Enlarged and adapted to the U. S. Pharmacopœia by k Woodbury, M.D. In one neat royal 12mo. volume of 498 pages. Cloth, $2 25.

is any book on a medical subject more the general practitioner than this one, we to learn of it. In our opinion, the student possessed himself of its contents is compeer upon the practice of his profession; busy practitioner who keeps it close at y feel that in it he has a trustworthy and nd and guide to follow. The general art is admirable, and everything useless or ful value is omitted or receives a bare nowhile those drugs which are thoroughly treated of have their physiological and therapeutic actions conveniently displayed in parallel columns. We shall not pretend to analyze the work; its full merits can only be made known by a personal examination. Dr. Woodbury has greatly added to the value of the book for American students, and in such an elegant and skilful, and withal modest manner, that our interest in him and his own forthcoming Handbook of Practice is much enhanced.—*N. C. Med. Journ.*, June, 1879.

FINLAYSON'S CLINICAL MANUAL—Just Ready.

ICAL MANUAL FOR THE STUDY OF MEDICAL CASES. For the use of Students d Practitioners of Medicine. Edited by James Finlayson, M.D., Physician and Lecrer on Clinical Medicine in the Glasgow Medical Infirmary, etc. With 85 illustrations wood. In one very handsome volume, royal 12mo. of 546 pages. Cloth, $2 63.

s one of the really useful books. It is attracm preface to the final page, and ought to be place on every office table, because it cona condensed form, all that is valuable in ogy and diagnostics to be found in bulkier s, and because in its arrangement and comndex, it is unusually convenient for quick ce in any emergency that may come upon the busy practitioner.—*N. C. Med. Journ*, Jan. 1879.

The book is an excellent one, clear, concise, convenient, practical. It is replete with the very knowledge the student needs when he quits the lecture room and the laboratory for the ward and sick-room, and does not lack in information that will meet the wants of experienced and older men.—*Phila. Med. Times*, Jan. 4, 1879.

HENRY C. LEA'S SON & CO.—Philadelphia.

NOTICE TO SUBSCRIBERS.

INCREASED INDUCEMENTS FOR 1880.

With a view of increasing the attractions of the "American Journal of the Medical Sciences," and of bringing within the reach of all members of the profession the immense amount of information now presented by it and its accessory periodicals, the "Medical News and Library" and the "Monthly Abstract," the two latter will hereafter be merged together, under the name of "The Medical News and Abstract," commencing January 1, 1880. The "News and Abstract" will consist of sixty-four pages per month, handsomely printed, in a neat cover, and will contain all the material heretofore presented in both periodicals, with the exception of the sixteen pages of the "Library Department." Its price will be Two Dollars and a Half per annum, invariably in advance, at which rate subscribers will receive nearly *eight hundred large octavo pages per annum*, free of postage.

Not only will this monthly thus be in itself one of the cheapest periodicals offered to the profession, but it will be furnished in commutation, without charge, to advance-paying subscribers of the "American Journal of the Medical Sciences," the subscription to which will remain, as heretofore, Five Dollars per annum. For this very moderate sum, therefore, subscribers will receive two periodicals of the highest class, a Quarterly and a Monthly, containing in all nearly two thousand pages per annum, stored with the choicest original and selected matter that can be furnished by the medical literature of both hemispheres.

These terms may be recapitulated as follows:—

TERMS FOR 1880.

The American Journal of the Medical Sciences, published quarterly (1150 pages per annum), and The Medical News and Abstract, published monthly (768 pages per annum),	Five Dollars per annum, in advance.

SEPARATE SUBSCRIPTIONS TO

The American Journal of the Medical Sciences, when not paid for in advance.	Five Dollars.

The Medical News and Abstract, invariably in advance, Two Dollars and a Half.

⁂ Advance-paying subscribers can obtain, at the close of the year, cloth covers, gilt lettered, for binding the volumes of the Journal (two annually) and the News and Abstract (one annually), free by mail, on remitting ten cents for each cover.

It is evident that only a very considerable increase to the existing subscription list will justify the unexampled terms thus offered, by which the equivalent of three or four large octavo volumes is furnished, handsomely printed in a form for preservation, for the trifling sum of Five Dollars. Gentlemen, therefore, are respectfully requested to lose no time in remitting their subscriptions to avoid the risk of disappointment from the exhaustion of the edition printed; and it is suggested that they may aid in rendering the enterprise permanent by kindly communicating to their friends the very great inducements thus offered.

The safest mode of remittance is by bank check or draft, or postal money order drawn to the order of the undersigned. Where these are not accessible, remittances for the "Journal" and "News and Abstract" may be made at the risk of the publishers by forwarding in registered letters. Address

HENRY C. LEA'S SON & CO.,
Nos. 706 and 708 SANSOM STREET,
PHILADELPHIA, PA.

Entered at the Post-Office at Philadelphia as Second-class matter.

VOL. XXXVIII. No. 5. MAY, 1880. WHOLE No. 449.

THE

MEDICAL NEWS

AND

ABSTRACT.

A CONSOLIDATION OF THE "MEDICAL NEWS AND LIBRARY" AND THE "MONTHLY ABSTRACT OF MEDICAL SCIENCE."

EDITED BY

I. MINIS HAYS, A.M., M.D.

PHILADELPHIA:
HENRY C. LEA'S SON & CO.
1880.

PUBLISHED MONTHLY AT $2.50 PER ANNUM IN ADVANCE.
Furnished in conjunction with the Quarterly American Journal of the Medical Sciences (in all nearly 2000 octavo pages) for $5.00 in advance.

According to the Act of Congress, in the year 1880, by HENRY C. LEA'S SON & Co., in the Off
of the Librarian of Congress. All rights reserved.

FOSTER'S PHYSIOLOGY—Revised Edition—Just Ready.

A TEXT-BOOK OF PHYSIOLOGY. A new American, from the third English editi Edited, with notes and additions, by EDWARD T. REICHERT, M.D., Demonstrator of Expe mental Therapeutics in Univ. of Penna. In one handsome royal 12mo. volume of ov 1000 pages, with over 250 illustrations. Cloth, $2 50; leather, $3 25.

AMERICAN EDITOR'S PREFACE.

The high reputation acquired, on both sides of the Atlantic, by Dr. Foster's "Text-Book Physiology," as a lucid exposition of functional physiology, in its most modern aspect, has seem to call for an edition more thoroughly adapted to the wants of the American student. The pl of the author has presupposed an acquaintance with the details of physiological anatomy such the student is accustomed to look for in his treatises on physiology. The absence of th details has rendered many parts of the work vague, if not altogether incomprehensible, and h therefore proved a serious drawback to the usefulness of the book as an accompaniment to l tures on physiology, as it is usually taught in our schools, and this deficiency the editor h endeavored to supply, by brief notes and the introduction of a large number of illustrations

The almost limitless amount of material accumulated by modern research has rendered di cult the task of selection and comparison, without exceeding the reasonable limits of a conv nient text-book. In his selection the editor has been guided by his experience in the wants students, and has endeavored merely to present, in the most concise form, such facts as would se to be indispensable to a correct appreciation of the structure and function of the import organs. In accomplishing this, his additions have considerably exceeded his expectati amounting to about 140 pages, including the illustrations which have been increased in num from 72 to 259. If he shall thus have succeeded in rendering this admirable work better fi for the wants of the American student, he will feel abundantly rewarded.

Nothing has been omitted from the English edition, and all additions have been dis guished by insertion in brackets [—].

On the whole, the book can be called the standard work in the English language, while it has none superior in any other tongue. It is, perhaps, the only work in our language which represents physiology fully as an experimental science. Its completeness is admirable. The anxious student can find not only the actual facts of the science, but also the mode in which they were obtained. The author proves to the student not only a compiler, but a judicious critic.—*Journ. of Nervous and Mental Diseases*, Jan. 1880.

The work, since its first appearance, has continued to be one of the most satisfactory text-books on the subject that we have met with, and is in many respects peculiarly adapted to the use of practitioners. Those whose knowledge of the functions of organs was chiefly acquired a decade ago, and who have not since been diligent students of the subject, can little appreciate what advances have been made, can do nothing better than to give Dr. Foster's w some careful reading.—*New Remedies*, Jan. 188

The author of this book is too well known to siologists to require an introduction. His co butions to this branch of science have secur him lasting fame. As an advanced thinker writer his views and teaching are regarded as highest authority, and may be accepted as the outcome of physiological research and study.—*Med. Journ.*, Feb. 1880.

An elaborate review at present is not required; only necessary to say that it is the best book o immediate scope in any of the three languag far, at least, as our knowledge goes.—*Philada. Times*, Jan. 3, 1880.

EMMET'S GYNÆCOLOGY—New Edition—Just Ready.

THE PRINCIPLES AND PRACTICE OF GYNÆCOLOGY, for the use of Students Practitioners of Medicine. By THOMAS ADDIS EMMET, M.D., Surgeon to the Wom Hospital of the State of New York, etc. Second edition, thoroughly revised. In very handsome octavo volume of 875 pages, with 133 illustrations. Cloth, $5; leather,

PREFACE TO THE SECOND EDITION.

The unusually rapid exhaustion of a large edition of this work, while flattering to the aut as an evidence that his labors have proved acceptable, has in a great measure heightened sense of responsibility. He has therefore endeavored to take full advantage of the opportu afforded to him for its revision. Every page has received his earnest scrutiny, the critici of his reviewers have been carefully weighed; and while no marked increase has been mad the size of the volume, several portions have been rewritten, and much new matter has b added. In this minute and thorough revision, the labor involved has been much greater t is perhaps apparent in the results, but it has been cheerfully expended, in the hope of rende the work more worthy of the favor which has been accorded to it by the profession.

A notice of the previous edition is appended.

It deserves and will receive the careful study of all who desire to keep on a level with the progress of Gynæcology. It embodies a larger amount of carefully analyzed personal experience in a unique field for observation than any volume on Diseases of Women which has yet been published. Its great merit consists in this—coming as it does from a thoroughly honest, competent, and able specialist, who became a specialist only after an excellent training and experience as a general hospital physician and surgeon. The book is not one to be hastily glanced over, but will secure the critical study of Gynæcologists. Not only its style, which is individual and somewhat peculiar, but the new facts which it b out, its original suggestions, its numerous and portant statistical tables, and, in some instance unexpected deductions, will compel attention, will form the basis for a great deal of Gynæcolo study and literature in the future. All who themselves familiar with the contents of this ume, will feel assured that Dr. Emmet has earned and well deserved the reputation whi has already won, as one of the great Gynæcolo of the present age.—*The Am. Journ. of Obstet* April, 1879.

CLINICS.

Clinical Lectures.

N THE TREATMENT OF THE VARIOUS FORMS OF CONSUMPTION,

DELIVERED AT JEFFERSON MEDICAL COLLEGE HOSPITAL.

BY ROBERTS BARTHOLOW, M.D., LL.D.,

OF MATERIA MEDICA AND THERAPEUTICS IN THE JEFFERSON MEDICAL COLLEGE, PHILA.

NTLEMEN: We have had before us recently a number of typical ex-
es of the different forms of phthisis; their distinctive clinical features
been pointed out, and details of the symptomatic treatment have
briefly indicated. It may be conducive to a clearer comprehension
important topic if we now review the subject of the treatment as
e, to ascertain how far the pathological conditions may guide and
l the therapy, and to note the more recent contributions to our re-
s.

ll take it for granted, as generally believed, that there are three
t forms of pulmonary consumption: Chronic, catarrhal, or caseous
nia, which is an essentially inflammatory disease; chronic tuber-
, with special direction to the pulmonary parenchyma, which is a
tic malady; and fibroid phthisis, which is a chronic interstitial pneu-
ingrafted on a chronic bronchitis. It must be obvious that if this
cation has a proper basis, it does not suffice to propose a plan of
ent for consumption, but our therapeutical methods must be guided
ntrolled by the pathological conditions. Whilst this is true, there
rtain general principles of treatment applicable to all forms. I pur-
o consider these first—they are climate and personal hygiene.

considering the subject of a suitable climate for a pulmonary invalid,
not go beyond the limits of the United States, within which are
ned the utmost variety, and, indeed, the perfection of health resorts
s purpose. In the absence of any statistical data showing the re-
f prolonged residence in particular localities which might indeed
the question, we have some general principles to guide us, too little

regarded by the profession, but of great value. We owe to Dr. Bowditch, of Boston, the eminent physician and sanitarian, the first principle, which he established for Massachusetts, and which has been confirmed on a larger scale for England. The Bowditch generalization is, that there is a constant ratio between the number of cases of consumption and the amount of water—rainfall and collections of water in streams, ponds, and lakes. This principle is not applicable to the ocean, where other conditions obtain. Certain parts of England, having had a large mortality from consumption, present a very different report since suitable drainage works have been put into operation. You need only to cast your eye over the elaborate Atlas of Medical Geography, by Lombard, to see how large a part excess of moisture plays in the geographical distribution of phthisis. All along the sea-coast are traced the deeply shaded lines, whilst in the elevated interior regions the mortality has disappeared. It is true that density of population and other evil hygienic influences are at work, but excess of moisture is a large factor.

Next to dryness of soil and climate as a remedy for consumption is elevation. This fact stands out as conspicuously in the great Atlas of Medical Geography as the previously considered influence. In the elevated regions—the great plains and plateaus of India, Africa, and America—phthisis is almost unknown (Lombard, vol. iv. p. 420). Elevation has an important influence in the relief of phthisis, because the air is dry and rarefied. Breathing rarefied air lessens the intrathoracic pressure, increases the rate of the respiratory movements and the rapidity of the pulmonary circulation. Residence in a rarefied atmosphere increases the rapidity of the circulation and the amount of blood in the peripheral vessels. The influences of these factors in promoting digestion, assimilation, and tissue metamorphosis are unquestionable. Uniformity is only less important as a requisite for a climate for pulmonary invalids. The reason of this requirement is obvious. Those invalids in a condition to be benefited by out-door exercise need an equable temperature in which to pursue their sports or recreations with safety. But more important than this is the bad influence of a variable climate in causing attacks of bronchial catarrh, a morbid process so much concerned in the production of caseous phthisis. Applying these principles to the question of a climate for consumptives, I place first on the list the great plains and plateaus of our interior continent, next certain parts of California, then a limited district, of which Aiken, South Carolina, may be regarded as the centre, and lastly, the upper lakes and Minnesota and the Red River of the North. In the limited space of a clinical lecture it is quite impossible to go further into details on the subject of climate.

Amongst the questions of personal hygiene, alimentation is the most important. And here, gentlemen, I have some important facts to submit to your consideration. We owe to Hughes Bennett the important practical suggestion that the initial disorders of phthisis are stomachal—that before any pulmonary trouble arises there is a period during which the organs of digestion do poor work, prepare the aliment imperfectly, and hence the nutrition of the body declines. That acute minded physiological surgeon, Mr. Jonathan Hutchison, has investigated this, as so many other subjects, in a quite original manner, and he finds that almost universally a form of dyspepsia precedes phthisis. In fact it is a matter of common observation, that the individual is out of condition, is losing ground, and this long before the manifestations of pulmonary lesions of any

d. A chronic gastro-intestinal catarrh is present, and one of its special
ures is that the patient has a positive distaste for the fatty constituents
he food, and that the power to digest fats is much impaired. In a disease
acterized by failure of nutrition, and in which the process of repair
feeble, it is of the utmost importance to maintain the digestion and
milation at the highest efficiency. There is a general agreement on
point, and hence no sooner is the diagnosis of phthisis arrived at than
njunction of active feeding follows. Without any attempt at correct-
he morbid state of the digestive organs, they are plied with the richest
ocarbons, with a tablespoonful of cod-liver oil before each meal, by
of appetizer, and a tablespoonful or more of whiskey after meals as a
ter. It results from this method that the appetite is utterly de-
ed, and the food, swallowed with disgust, is either rejected or remains
tress. I hope you will always bear in mind that it is not the quan-
f food swallowed, but the amount digested and assimilated which is
rtant to the welfare of the individual. The diet, then, should be
lly regulated to the requirements of the individual. Let me now
ou a practical hint, on which you will be able to act with great good
r patients. *A period of rest to the stomach by a minimum diet will*
the organ to recover from the morbid state, and will induce a great
e. Acting on this rule, I have repeatedly effected great improvement
condition of phthisical subjects at the initial period. Put the
on milk for a week or two, and then gradually construct a suitable
y. To remove the condition of gastro-intestinal catarrh there are
remedies on which we may rely with confidence. Arsenic stands
robably, and is to be given in small doses—two drops—three times
before meals. Scarcely inferior to arsenic is the combination of
and carbolic acid: ℞. Tinct. iodinii ℥j, acid. carbol. ℥ss. M. Sig.
two drops in a tablespoonful of water three times a day, before
The oxide and nitrate of silver are also highly serviceable, but
nately they cannot be continued long, owing to the danger of ar-
The mineral acids, if the digestion merely flags, or if the previ-
edies have been taken for a sufficient time, are very important
es. I have seen some striking results from the use of the nitro-
ic acid during the initial stage, but the action of this remedy in
g morbid states of the mucous membrane and in promoting appe-
digestion is the secret of any curative power it possesses. The
strychnia, dissolved in diluted muriatic acid, makes a useful com-
, for strychnia is probably the most effective agent which we pos-
arresting the vomiting of phthisis.

he morbid state of the mucous membrane has been removed, and
petite restored, then we may consider the question of forcing the
on by increasing the performance of the assimilative organs. Now
y give cod-liver oil, and aid its digestion by the administration of malt
or alcohol in some form. It should be given after meals, to be di-
and assimilated with the other foods. It is a great error to admin-
he oil, as is so often done, on an empty stomach and some time before
al, because it will spoil the appetite, and keep the stomach at work
g its proper period of repose. Furthermore, the quantity of oil
should rarely exceed a teaspoonful, for this amount only can the
ive organs properly assimilate at one time. If it impair the appetite
nnot be digested it is useless, and should not be continued. Bernard
ut us in possession of an important fact, which ought always to be

utilized—that is, that ether promotes the digestion of the oil when administered with it. Bernard's notion was that ether increases the flow of the pancreatic juice, and must therefore promote the emulsionizing of the oil. Whether or no the theory be correct, there has been accumulated sufficient testimony to show that the digestion of the oil is much more easily and perfectly accomplished by the addition of some minims of ether.

To what extent is the administration of alcohol desirable and proper in the treatment of phthisis? First of all, we should take our position firmly against a too prevalent notion that whiskey is in a certain degree antidotal, and that any case of consumption must be cured if only it is given early enough, and in sufficient quantity. This mischievous fallacy is so far from true, that we now know a form of degeneration of the pulmonary parenchyma is produced by alcoholic excess. Before hectic comes on, as a rule, the extract of malt and malt liquors are preferable to whiskey and brandy. When wasting proceeds rapidly, and destruction of the lung tissue is going on at the same pace, when the fever approaches more and more the septicæmic type, the stronger liquors are better, but at any period whiskey should be given instead of malt liquors, if it agrees better. Is there any guide to the proper administration of alcohol? I am perfectly clear that these are well-defined principles: That quantity of spirit which increases the appetite, and improves the digestion, is the proper quantity. An excess is hurtful, because the alcohol precipitates the pepsin from its solution in the gastric juice, and therefore suspends the production of peptones. A large quantity taken on an empty stomach is without influence on the digestion of foods, and whilst it affects the mucous membrane injuriously, after absorption acts on the hepatic cells. These reasons seem conclusive in favor of a moderate quantity of alcoholic food—say half to an ounce of whiskey—taken after each meal.

I will now pass to the consideration of particular forms of phthisis.

You have seen recently several cases of caseous phthisis, in which there were considerable areas of infiltration; the period of inflammation had passed, and the products accumulated in the alveoli of the lungs were undergoing caseation. Now the problem for solution in these cases is, How shall we obtain the softening and extrusion of the caseous material without destruction of the pulmonary tissues? Although it is generally held that we possess no direct means of acting on these caseous deposits, and that they can be removed only by the improvement which we may effect in the bodily condition, I have reason to believe that we can reach and act on them to a considerable extent. The salts of ammonia have the power to increase the alkalinity of the blood, to prevent coagulation of fibrin, and to dissolve the albuminous exudations. Whilst these remedies were administered I have repeatedly observed the absorption and disappearance of caseous deposits. It is obvious the smaller in extent and the more recent the more amenable to the action of the remedy. Probably the best mode of administration of the ammonia is to dissolve the carbonate in solution of the acetate (gr. v–x–℥ss), or when it is desirable to give the iodide with the carbonate, they may be administered in an emulsion together. The duration of the administration will be governed by the effect on the caseous deposits, and by the forbearance of the digestive organs, but the remedies must be used for many months in most cases. By giving them properly diluted before meals, and allowing the stomach periods of rest, they may be continued for lengthened periods without ill results.

The range of temperature, and the amount and kind of interference quired, are very important subjects. With regard to the character of e fever it must suffice for me to insist upon the fact, which I have often ted, that the febrile movement of the stage of exudation and deposit is erent in character from that of the period of softening and extrusion. e former is inflammatory; the latter septicæmic. During the inflam- tory stage we are concerned to employ means to lessen exudation, and favour its immediate liquefaction and discharge. These means are nia, digitalis, aconite, jaborandi, etc. When, however, the alveoli are cked with the caseous deposits our attention must needs be directed to re a favourable disposition of this material. When the caseation is pleted there is a temporary subsidence of the active symptoms, which continue for some time; the fever abates notably or disappears; the ral state correspondingly improves; the cough is less troublesome; expectoration slight; and there is, in fact, a delusive appearance of ning health. The scene changes when the process of softening ns, and moist sounds are audible in abundance where bronchial voice breath were heard a short time before. Now there is an extensive of pus formation, and the fever which attends it is a septicæmic fever. re the attendant phenomena: there is a daily sensation of coldness, of ness, or a distinct chill, some time during the morning, and for a time before it the temperature had been at nornal or even below; a fever comes on, the mercury rising to 103°, 104° F.; and the process terminating in a profuse sweat. In respect to this fever practical point I wish to impress on you is, that the best means of ing down the temperature are rest, and the administration of reme- to restrain the sweats, and to quiet the cough. By rest I mean a tion of repose without exercise, except such muscular movements as equired in dressing, in walking from one room to another on the same , etc. There are sound physiological reasons for this recommenda- Rest lessens the consumption of material, the wear of tissue, and roduction of heat, and conversely exercise increases the consumption aterial, wastes the tissues, and increases the production of heat. Ap- g the physiological data to the subject before us, I must admit that ise is theoretically prejudicial to the phthisical suffering from septi- c fever. I have made a number of careful observations with a rd thermometer to ascertain the effect of exercise on the daily tem- re of consumptives in the stage of softening, and I have noticed a from one to two degrees. Any observant physician, whose atten- directed to it, will not fail to perceive the disastrous effect of per- exercise in respect to an exacerbation of all the symptoms. Whilst strongly insist on the necessity for rest when there is any consider- elevation of temperature in phthisis, I do not mean to apply this dic- to all cases. In the cases of incipient phthisis, fibroid lung, and ic forms, with little fever, I advise an outdoor life, and exercise con- t with the stamina of the individual. Experience has abundantly n that in cases of consumption at the initial stage, an outdoor life of considerable exposure, indeed, is permanently beneficial. Further- , gentlemen, I must relieve your minds of the impression, if you received it, that I mean by *rest*, confinement to the foul air or other hygienic influences of the sick room, By no means. Rest is not in- patible with constant, or nearly constant, exposure to the external air, this I always insist upon in prescribing the necessary regimen.

I come now to another symptom—cough—which usually taxes sev the resources of the physician. As cough prevents sleep, destroys and is exhausting, the patients are clamorous for relief. Much coug is a peculiarly severe form of exercise, and demands suppression or lioration for this reason. The expedients are almost past computatio sure indication both of failure and intractability. The reflex irrit proceeding from the fauces may be allayed by a gargle of bromide of sium, by brushing over the mucous membrane a one per cent. solutio carbolic acid, or by atomizing a solution of morphia. The combinati diluted hydro-bromic acid, and spirit of chloroform proposed by Dr. F ergill, does very well sometimes, but in general is disappointing. In there are no efficient substitutes for opium, and we must turn to when the cough is severe and persistent. The most generally usef the preparations and derivatives of opium is codeia. The grounds utility in cough, are these: it has a selective action on the pneumog nerve, allaying irritability of its end organs; it is calmative and hyp and as compared to morphia is less excitant and less nauseant. Cod adapted to those cases in which the cough is largely nervous. It m combined with strychnia when there is vomiting, and with atrop picrotoxine when the sweats are profuse. The following are exam ℞. Codeiæ sulph. gr. x, ext. hyoscyami ℈j. M. ft. pil. no. xx. Sig pill every four hours. ℞. Codeiæ sulph. gr. xvj, strychniæ sulph. atropiæ sulph. gr. ⅛, acid. sulph. dil. ʒij, aquæ ʒvj. M. Sig. T fifteen drops three times a day. Morphia may be substituted for cod any of these prescriptions, by reducing the quantity one half. Ca acid exercises no little influence over cough, expectoration, and feve is most serviceable in allaying the reflex vomiting. It is best giv solution, as follows: ℞. Acid. carbolic. gr. viij, aquæ lauro-cerasi, āā ℥i. M. Sig. A teaspoonful every four hours. Carbolic acid is cially indicated in the fetid expectoration of bronchiectasis. In the of fibroid lung, and of the stage of deposit before softening in ca pneumonia, I have had excellent results from the administration of i of ammonium in the wine of tar. ℞. Ammonii iodidi ʒij, vini liquid. syrp. tolu āā ℥j. M. Sig. A teaspoonful.

Now, gentlemen, I come to the last topic which I can discuss to-d night sweats. This is both an interesting and an important subject. is interesting because of the striking results obtained by some new c butions to our therapeutical resources, and important because of the b influence of the sweats over the progress of the disease. If the swea profuse, there is an actual loss of material, of salts and organic m which represents waste of tissue. It is highly important to check waste and preserve the material for the nutrition of the body. Unti recent observations of Dr. Murrell proving the great value of picroto atropia had the first place as a remedy for the night sweats of phthisi have usually given atropia with strychnia and morphia for the triple of arresting the sweating, allaying cough, and stopping the reflex vomi It is not a little remarkable that the temperature is generally reduce the combined use of these remedies. I have preferred to give the at with regularity three times a day, because of an influence over the pro of the disease, which seems to be independent of its anhydrotic power, which can be explained only, on the supposition that it has the pow improve the nutrition of the lungs. Its introduction into use as a re for phthisis, has put a new phase on the prognosis of cases of ca eumonia, not advanced to the stage of softening. Some practitioners efer to give atropia in a single full dose ($\frac{1}{80}$th of a grain) at bed hour, t the results are better, if given in a small quantity ($\frac{1}{500}$th of a grain) e effect being distributed through the day. The susceptibility to the tion of atropia varies greatly, and as immense discomfort may be pro- ced by a medicinal dose, care is necessary to avoid unpleasant results. cognizing the importance of the influence which atropia appears to have the trophic system of the lungs, I have had patients take it for years a time, and without any ill effects.

The success of picrotoxine as an hydrotic has been quite decided. Dr. rrell finds that so small a quantity as the $\frac{1}{500}$th of a grain, given at bed r, may arrest the sweating for a number of days. Although possessed roperties somewhat like those of strychnia, it is by no means so pow- l, and may be given by the stomach up to $\frac{1}{30}$th of a grain. Dover's der, and, oddly enough, pilocarpine occasionally acts, very decidedly n arrester of perspiration—a capital illustration of certain kinds of iological antagonism. But pilocarpine cannot be depended on for tant service. Take it all in all, atropia should be preferred in most , because of its apparent influence over the nutrition of the lungs. lst atropia is given, three times a day, picrotoxine may be exhibited dtime, if the effect of the former is inadequate.

ere are other important topics connected with the treatment of phthisis h I would gladly enter on, if there were sufficient time, but in the I have laid before you will be found the main points from which the ls may be easily derived. You will find, indeed, that treated accord- to the principles I have just developed, many cases of phthisis will be cted ultimately to a safe termination, and you will learn to look with hopeful confidence on the success of your management than you have bly done heretofore.

ATARRH OF THE BLADDER; ALBUMEN IN THE URINE.

ert of a Clinical Lecture recently given at University College Hospital.

BY SIR HENRY THOMPSON,
Surgeon Extraordinary to the King of the Belgians.

re is a group of symptoms frequently met with in men of advancing years, ich I desire especially to call your attention. One of the first circumstances ract notice is that the urine is more or less cloudy when passed, and that on ing it deposits some adhesive opaque matter in the bottom of the vessel. urine is generally neutral, or at best faintly acid; occasionally it is alkaline, ys becoming so rapidly by keeping. On interrogating the patient, you learn the act of micturition is performed rather more frequently than natural—that disturbed by it two or three times in the night, and every two hours or so ng the day. He may also complain of dull pains about the pelvis and back; finds the effort to pass water rather greater than it formerly was, and the ral health has of late suffered a little.

ow it is by no means uncommon to hear this group of symptoms spoken of as cating the presence of a "catarrh of the bladder." And catarrh of the blad- is very generally regarded as a particularly obstinate, sometimes indeed as an urable, affection. And I am free to confess that as long as these phenomena are considered referable to a specific disease, "catarrh," so long probably the disease prove rebellious to treatment and sometimes even incurable.

Again, when the urine described is examined by the microscope, a quantity pus, varying much in different cases, is seen to be present in it; and when amined by heat and nitric acid, a certain amount of albumen is, as a matter course, deposited.

It happens to me, in the course of consultations, to observe that these ph mena—the admixture of pus with the urine and the presence of albumen— singly or together, frequently regarded in themselves, and apart from other f as necessarily presenting indications of very grave importance. Are they so?

Certainly they are by no means necessarily grave; on the contrary, in great majority of cases of elderly men, the presence of these products is not gr Let me demonstrate to you the marked distinction which exists between the nificance which albumen possesses in two different categories of cases. I scarcely ask your attention to a matter of higher practical importance.

1. When a patient's urine, habitually clear, acid, and free from the fai blood-tint, throws down to the test of heat and nitric acid a notable quantit albumen, the source of that albumen is the renal circulation, and, if persis the case is almost certainly one of grave import. The presence of organic ch in the kidney structure is to be inferred, and other evidence of its existenc sought for, will probably be found.

2. A very slight admixture of blood in any urine, no matter what the sour the hemorrhage, will produce a considerabie deposit of albumen. It is evi then, that the product in such cases, although sometimes grave, is not neces so, and that it may furnish an indication of the slightest possible import, inas as a little blood may appear in the anterior passages, from a lesion which is and temporary in its nature.

3. Pus in the urine may, and most commonly does, proceed from some condition of the bladder, occasionally, indeed, from local inflammation of urethra. Nevertheless, albumen will be deposited on applying appropriate t It is evident that albumen, resulting simply from pus produced by chronic cys has an import vastly less grave than that described above as No. 1, being a p local and mostly temporary affection of an organ which has no vital function, merely a mechanical one; the albumen in the former instance being evidenc disorganization in the structure of a vital organ—that is, one the sufficient of which is essential to the very existence of the body.

In short, there ought not to be the slightest temptation to confound two so utterly unrelated as the two states which I have here contrasted, although offer from one point of view an accidental similarity—that is, there is in bo admixture of albuminous material in the urine.

Still, nothing is more common than to hear, in connection with a case of p local bladder affection, the remark gravely and significantly made, "I assure I have on several occasions found by testing a large quantity of albumen in patient's urine." It is a little difficult sometimes, although necessary, to to such an observation with quite sufficient patience. Does the observer desire to intimate that the patient has constitutional albuminuria—*i. e.*, form of Bright's disease? If not, his remark is simply devoid of meani since, as we know, there is vesical pus in the urine, we know equally that albuminous constituent must appear on applying the test. And vesical p the urine certainly has no more relation to constitutional albuminuria than which comes from an external abscess or surrounds a common boil. Simpl all this may appear to you and to me, it is quite astonishing how much conf there is in men's minds in regard to this matter, and how much importance persons attach to all albumen found in a urinary test-tube, although the source of the deposit may be easily demonstrated to be the bladder, and no other part of the organs which lie above it.

Finally, the important practical point in relation to treatment is first to ascerain the occasion of the local catarrh. In nine out of ten of these cases it consists in inability, often only to a slight extent, on the part of the patient to empty the ladder completely. The universally acknowledged cause, hypertrophy of the rostate, is, of course, the first in order of frequency. But after this are others t infrequent. Defective action may be due, first, to simple atony, the result f past habitual or occasional over-distension of the bladder with urine; secondly, thickened and incompetent muscular parietes of the bladder after chronic inmmation, sometimes associated with old stricture; thirdly, to defective innertion seen in connection with other slight signs of impaired function in a nervous tre; the last being, of course, the most serious of all, in its nature and probae results.

In all of these local treatment, by carefully removing all the secretion by means a soft catheter two or three times a day, perhaps aided by gently washing out e remainder, is the chief efficient remedy. Remember that this incompetence he bladder is always to be sought for by physical examination; no other form evidence in relation to it, as the patient's sensation, etc., is to be accepted as worthy. The introduction of a soft catheter immediately after the patient passed water by his natural efforts, is the only test, and it should be applied wo or three occasions before arriving at a definite conclusion. The causal tion between the group of symptoms enumerated at the outset, and the defecfunction described, is far more common than it is generally supposed to be. s on this account, therefore, that I have asked your attention specially to the ject.—*Lancet*, Jan. 3, 1880.

Hospital Notes.

Case of Intravenous Injection of Milk.

ichael M., aged forty, was admitted into Jervis Street Hospital, Dublin, r the care of Dr. Meldon, on Dec. 4, 1879. About two years before, symps of phthisis commenced, and gradually increased until May last, when his ds were in daily expectation of his death. Dr. Meldon injected three and lf ounces of milk into his veins. The operation, which was not followed by y obstruction of respiration, gave him almost immediate relief from the feeling eakness from which he suffered. His appetite returned; he slept well, and a few days he was able to sit up. Soon after he was sent to the convalescent pital, where he continued to improve, and in about six weeks was able to me his occupation of a pawnbroker's assistant. During the summer months improved very much, and increased considerably in weight. In November t he was attacked with pneumonia, after which he had a constant cough. The er symptoms of phthisis also returned, and increased until, unable to continue employment, he sought admission into the hospital.

On admission both lungs were extensively diseased, and there was constant rrhœa, which had reduced the patient to an almost moribund condition. His gh was most distressing, and he was unable to take any nourishment. As all orts to improve his condition were of no avail, Dr. Meldon, yielding to his patient's own urgent entreaty, consented to repeat the operation of injecting mil into the veins.

On the 13th of January, assisted by Drs. Cranny, Stoker, and Kelly, and i the presence of a large class of students, Dr. Meldon injected three and a hal ounces of goat's milk, at a temperature of 100°, into one of the veins of the righ arm. The milk, as usual, was rendered alkaline by the addition of carbonate o ammonia, and the goat was milked at the bedside of the patient. During th operation the man complained of pain and coldness in his back, but he stated h did not feel any difficulty in breathing or pain in the head. Soon after the ope ration the temperature rose from 99° to 104°; his breathing for a few hours wa somewhat hurried, but there was no obstruction to respiration, as in many of th previous cases. The pain in the back and the coldness remained for some hou but the patient slept well that night, and awoke next morning greatly improv in spirits and feeling much stronger. The diarrhœa was, as in all former cas immediately checked by the operation. For some days he made steady progr towards recovery—his appetite increased, and his cough diminished.

Dr. Meldon, in his remarks to the students, said that the operation of int venous injectment of milk had been received in Europe with very little enco agement, and even in New York, where there was every promise of the ope tion receiving a fair trial, it seemed to have fallen into disrepute. The pres was the tenth case in which Dr. Meldon had performed the operation, and w a result that made him most hopeful of its success when performed in suit cases and with proper precautions. As yet he had only resorted to it in ca where the patient's hours were already numbered. In all these cases life been considerably prolonged, and in four the patients had been completely cu by the operation. The operation was quite free from danger if one or two po were attended to, besides those which had to be looked to in every case of tran sion. The two points which were peculiar to the transfusion of milk were, care should be taken that the milk was alkaline, and that only a small quan should be thrown in at a time, four and a half ounces being the largest amount should be injected. Lately a good deal has been written against the operat The opponents of the procedure might be classed under three heads: First, th who say it is *theoretically* wrong, second, those who argue from experiments lower animals, and, thirdly, those who believe the globules of the milk are too h to pass through capillaries. The first and last of these may be met by pointin the fact that several cases have been successful, and in no case where the ope tion has been performed with proper care with regard to the two special po which Dr. Meldon mentioned have injurious results followed.

With regard to the comparative experiments on dogs, the great error had be that healthy dogs had been selected, and, comparatively speaking, an enorm quantity of milk had been injected.

Dr. Meldon stated that he had no doubt if a healthy country patient w selected for the operation, and say forty ounces of milk injected into his vei the result would be almost necessarily fatal. This really had been the kind experiment on dogs, and it was not surprising that the conclusions drawn fro these experiments should be so unfavourable.

The cases which Dr. Meldon had cured were all cases of pernicious anæmi and he stated he could easily understand how in that disease a small quantity corpuscule-supplying fluid might alter the condition of the blood, and there effect a cure.—*Lancet*, April 3, 1880.

MONTHLY ABSTRACT.

Anatomy and Physiology.

Congenital and Progressive Hypertrophy of the Right Upper Extremity.

Hypertrophy of one extremity or of one side of the body is of very rare occurrence, and cases have only been met with and reported by continental writers, with the exception of that of Mr. Adams, reported in the *Lancet* in 1858. The case recorded in this instance by Professor OSLER (*Journ. of Anat. and Phys.*, vol. xiv. part 1) occurred in a girl nearly nine years of age. The enlargement seems to have existed from birth, but had been passed over almost unnoticed for some time, till the great disparity in the size between the two hands attracted ttention. When the case came under the observation of the author, the limb oked like that of a medium-sized man. The enlargement extended to the uscles of the shoulder, namely, the deltoid, pectoralis major, and trapezius, though to a less extent in the latter; the sterno-cleido-mastoid muscles, how- er, were of equal size. The right arm measured from the tip of the acromion the styloid process of the radius 42 centimetres, whereas the left was only 37 timetres, making a difference of five centimetres in the length of the two arms. he right humerus measured 3.1 centimetres longer than the left, so that the fference between the forearms must have been 1.9 centimetres in favour of the ght. The clavicles did not vary more than they frequently do on the two sides the body of a normal person. The circumference of the right arm, with the ceps extended, was 18.5 centimetres, while that of the left, with the muscle in e same state, was 15.6 centimetres. When the biceps was strongly flexed, the ght arm measured 20.3 centimetres, and the left 15.9 centimetres. The circum- rence of the right forearm in its thickest part was 21.2 centimetres, while the ft measured only 17 centimetres; the right wrist measured 15.5 centimetres in cumference, while the left was only 13.5 centimetres. Similar variations were und in the measurements of the hands, the right being larger than the left, in e same ratio that the right arm was larger than the left. The biceps was very ongly developed, as were all the muscles of the humerus. The right forearm owed a marked contrast to the child-like appearance of the left. The fingers re kept in the semi-flexed position, but all except the middle finger could be tended at will. The power over the fingers which the patient possessed seems have been only gradually acquired by use, and the fingers were much more exed when the patient was younger. The grip of the two hands was very rked, that of the right being much more powerful and strong than that of the ft.—*London Med. Record*, March 15, 1880.

Materia Medica and Therapeutics.

Tayuya.

Recent investigations add weight to the estimation of the value of this drug in scrofula and syphilis. Various writers cited in the *Centralblatt für Chirurgie*

No. 48, 1879, give notes of fifteen cases of syphilis and one of ulceration of the lip of uncertain origin cured by tayuya within a month. **Alpago Novello** gives the case of a girl, aged 9, suffering with scrofulous ulcers and submaxillary lymphatic engorgement, lymphoma of the neck, etc., who was much improved by the use of the tincture. Of two other similar cases, one was almost or entirely cured, the other much improved.—*Lond. Med. Record*, March 15, 1880.

Bromide of Ethyl.

Dr. R. J. **Levis**, Surgeon to the Pennsylvania Hospital, has lately been using the bromide of ethyl as an anæsthetic, and has now had sufficient experience upon which to base some very decided impressions of its value. Its principal physiological characteristics which will concern the surgeon are its rapidity of action and the quickness of recovery from its effects. As far as observed by Dr. Levis, it does not influence the circulation, excepting to sometimes produce a slight increase in the rapidity of the heart's action and in arterial tension or pressure. The cerebral anæmia and the fatal syncope of cardiac depression, to which cloroform is liable, are dangers which do not appear to threaten in the anæsthesia of the bromide of ethyl. Respiration is but little influenced by the bromide of ethyl, beyond the ordinary characteristics of all anæsthetic sleep; but in this respect its action seems more to resemble that of ether than that of chloroform. Nausea and vomiting appear to occur less frequently in the anæsthesia of the bromide of ethyl than in that of ether or of chloroform, and the rapidity of recovery from its effects must render such impressions very brief and transient. Commencing with the occasional and very cautious use of the agent, Dr. Levis has recently adopted it to the exclusion of other anæsthetics.

Bromide of ethyl, or hydrobromic ether, is a colorless liquid, with a specific gravity a little greater than that of water. It has a decided and characteristic odor, which is thought to resemble that of chloroform, but is less agreeable. It vaporizes more readily than chloroform, and in this respect and in density is intermediate between ether and chloroform. It seems to be entirely eliminated through the lungs, and in this regard has a decided advantage as to safety over chloroform. The high vaporizing point of chloroform does not permit its rapid elimination from the body, and it is not entirely removed by the lungs. So, when some secreting organs happen to be, from disease, incapacitated, the nervous system is liable to become overwhelmed. The odour of the bromide of ethyl remains for a longer time on the breath of a patient than does that of ether or chloroform, but it seems to be quickly dissipated from the apartment in which it has been used. Its vapour is quite unirritating to the respiratory passages when inhaled, and in this quality has the advantage over both ether and chloroform.

General excitement and the tendency to struggle occur far less frequently than in the early stages of the anæsthesia of ether, and, apparently, even in that of chloroform. It is evident that the impression on the motor centres must be very rapid, and Dr. Levis estimates that complete anæsthesia is accomplished in one-third less time than is the case with chloroform. The recovery from its effects is even comparatively more rapid, in the greater number of cases the time not exceeding two minutes after the inhalation has ceased. Muscular co-ordination is so quickly regained that the patient is often able at once to stand and to walk on awakening from profound anæsthesia. The pupils dilate as soon as complete anæsthesia is induced, and, as the sentient state returns, they resume their normal condition. Dr. Levis suggests that the condition of the pupils may be an index and guide in the administration.

Anæsthesia with the bromide of ethyl is usually effected in from two to three minutes. The most rapid production of complete insensibility, in Dr. Levis's experience, has been in one minute, in the case of a girl eight years old; the longest period has not in any case exceeded four minutes. When carefully administered, the quantity consumed has varied from one fluidrachm in the case of a child, iridectomy being performed, to eleven drachms used during an amputation of the forearm of an adult, occupying forty minutes, including the ligation of the vessels and the dressing of the stump.

The quantity of the article consumed in affecting anæsthesia will greatly depend on the method and manner of using it. Much of it is, of course, wasted by dif-sion in the atmosphere. With great regard for economy, this waste may be prevented by imperviously covering the material on which it is poured. Dr. Levis's lan, with adults, is to pour two drachms of the bromide of ethyl on a small pkin folded up to a space of about four inches square, and then laid on a ger napkin, folded so as to be large enough to cover the entire face of the tient. It is well to secure the two napkins together with a pin.

The vapour of the bromide of ethyl is not inflammable; indeed, when dense, extinguishes a flame if brought into contact with it.

Whilst feeling inclined to impress caution in regard to the use of so powerful agent as the bromide of ethyl, Dr. Levis is, from a basis of experience, in-ed to recommend its use to the profession.—*Philadelphia Medical Times*, 17, 1880.

Subcutaneous Injection of Metallic Mercury.

Professor FURBRINGER, of Jena (*Archiv für Klin. Med.*), has made a large ber of hypodermic injections of metallic mercury, and states that at the time injection they are well borne, but within twenty-four hours inflammatory symp-s set in, and frequently result in abscess. If it be simply injected and not ided by subsequent rubbing, no mercury can be found in the urine, but it has n obtained in a reguline state under the skin at the end of a year and a half. wever administered, a slow improvement of the syphilitic symptoms takes ce. Metallic mercury is best borne when injected in an emulsion of mercury o parts, mucilage of acacia and glycerine each ten parts. One or two injec-s per week should be made. Fürbringer believes that this plan of treating philis by mercurial emulsion injections should be reserved for cases in which nctions and internal treatment fail or in which it is not advisable to make fre-nt injections.—*Lond. Med. Record*, March 15, 1880.

Uses of Physostigmin in Diseases of the Eye.

WEBER (*Arch. für Ophthal.*, and *Jahresbericht*) publishes his experience of therapeutic value of physostigmin in various diseases of the eye, which he increases the tension in the vitreous space and diminishes it in the anterior mber. It acts in direct antagonism of atropia, which in a healthy eye lowers tension in the vitreous space and raises it in the anterior chamber. He, there-e, recommends physostigmin in keratocele, in conical cornea, in ulceration of cornea, as highly advantageous. In glaucoma, he found physostigmin very eful, and explains its effect, that by the contraction of the pupil the detachment the ciliary margin of the iris from the periphery of the cornea is effected, and filtration of the fluids of the eye through the canal of Fontana is rendered possible, and thus tension is diminished.—*Lond. Med. Record*, March 15, 1880.

Nitro-glycerine as a Therapeutic Agent.

For some time past, nitro-glycerine has been used as a remedy for neuralgia, but has never attained anything like a wide popularity with the profession, probably on account of the disagreeable, not to say dangerous, effects known to follow an overdose. The case is recorded of a lady who, for many years, suffered from a most persistent neuralgia, which had resisted the best efforts of her numerous medical advisers. At last, it was determined to try the effects of nitro-glycerine, and she was given two and a half drops of a five per cent. solution in a teaspoonful of water. In the course of a minute or so, she complained of sickness and faintness. These rapidly increased, and there was for a few minutes unconsciousness, accompanied by stertorous breathing and convulsive action of the muscles of the face. She became deadly pale, the pulse was alarmingly feeble, and for a time she was undoubtedly in imminent danger. Some brandy and water was poured down her throat; she vomited, and the unpleasant symptoms gradually subsided. On recovering, she found that her neuralgia had left her completely, and, as it subsequently proved, permanently.

This is a remarkable case, but the fact of an overdose of a strong solution having been given is no argument against its employment, in a more dilute form, in the hands of a skilled observer. Both Mr. Field and Dr. Brady speak of i as an anti-neuralgic of the greatest value. It is not likely to supersede established remedies—such as quinine, chloride of ammonium, croton-chloral, phosphorus and gelseminum—in the treatment of neuralgia; but still it may be found useful from time to time, and in obstinate cases. In addition to its use in neuralgia, i has been suggested as a remedy for tetanus, hydrophobia, sea-sickness, chloroform poisoning, and many other morbid conditions.

It is, however, as a remedy for angina pectoris that it will be found most usefu Dr. Murrell's cases show that, in the treatment of this terrible complaint, it is a agent of the greatest possible value, worthy to be ranked with nitrite of amyl. I is now in general use in most of our London hospitals, and in many cases it h effected a complete cure. A very striking account of the benefit derived from i employment has been published by Mr. Jameson, of Caistor, who suffered ve severely from angina pectoris. At Dr. Murrell's suggestion, he began by taki two minims of the one per cent. solution every three or four hours during t day. He always found relief if he took the dose when he felt the first threate ing of the attack, and the paroxysm was staved off. He continued taking th two-minim dose regularly every three or four hours for four days, and, as th attacks did not trouble him so much, he began to diminish the frequency of t dose, and took it only when he felt an attack threatening. He says: "I alway carry an ounce and a half bottle of the diluted solution in the breast pocket of m coat, the bottle carefully marked for six doses, each dose containing five minims of the one per cent. solution. If I feel an attack coming on, I apply to my bottle, and at once feel that I am saved from a paroxysm. The action of the medicine seems to commence the moment it is swallowed, just as Dr. Murrell describes. It produces always a feeling of fulness in the head, singing in the ears, and a sensation of pulsation all over, especially in the head, severe at the root of the nose, as if epistaxis were threatened. I do not suffer from headache, and the congested feeling soon goes off. It is a great boon to have a remedy in which you can have perfect confidence that the attacks can be controlled. I have not had any severe attack of the disease since I got the solution, and began to take the drug, six weeks ago."

The nitro-glycerine can be obtained in solution either in alcohol or in ether, but the former is usually preferred. It is difficult to lay down any absolute rule as to dosage; but it is a good plan to begin with a drop of the one per cent. solution—or, in the case of a delicate woman, even less—and gradually to increase it until the full physiological action is produced. A dose may be administered at stated intervals—*e. g.*, every three or four hours; but it is best to be guided by the urgency of the symptoms, and to give it only at the threatened onset of an attack. The condition of relaxation of the bloodvessels, as shown by Dr. Fancourt Barnes's sphygmographic tracings, usually lasts about half an hour. At first, headache is often a source of inconvenience; but tolerance in this respect is soon established, and the patient ceases to complain. It is undoubtedly, in many cases, a nuisance to have always to carry a bottle of medicine about in the pocket, and an attempt has been made to put up the nitro-glycerine in a more portable form. Mr. Martindale has recently shown that it is soluble in melted cocoa butter, and this mass may be employed as a basis for making pills. The great objection to the pills is that they do not act so quickly as the spirituous solution, unless munched up in the mouth, and the idea of having to chew pills is anything but a pleasant one. A better plan is to add an equal quantity of chocolate-paste to the pill-mass, and then to roll it out and cut it into lozenges, which can be made of any desired strength.

It is often asked if nitro-glycerine can be dispensed with perfect safety, and this question we can answer most positively in the affirmative. With the most ordinary care, it would be impossible for an accident to occur. There would naturally be objections to manufacturing nitro-glycerine in the midst of a crowded city; but there can be no danger in keeping the one per cent. solution in small quantities for medicinal use. The pill-mass may be thrown on the fire, or hammered on an anvil, without any danger of explosion; and it has not been found necessary to adopt the suggestion of a daily contemporary, and label each box of pills: "Explosive, with care: containing dynamite." Nitro-glycerine can be used in medicine with perfect and absolute safety. It has already proved of such service, that it is to be hoped that the one per cent. alcoholic solution may find a place in the next edition of the *Pharmacopœia.*—*British Med. Journal*, March 27, 1880.

Odourless Iodoform.

No satisfactory method of disguising the penetrating odour of iodoform has yet been proposed. The following formula, however, it is asserted by Dr. LINDEMANN (*Allgemeine Medicin. Central-Zeitung*, 1879, No. 74), does away with the smell entirely: ℞. Iodoformi, gr. xvj; bals. Peruviani, gr. xxx; vaselini, adipis, ung. glycerini, āā ʒij.—M. If desired in a fluid form, the following formula may be employed: ℞. Iodoformi, gr. xvj; bals. Peruviani, ℈iiss; alcoholis, glycerini, collodii, āā ʒiij.—M.—*Lond. Med. Record*, March 15, 1880.

Medicine.

Benzoic Acid in Acute Articular Rheumatism.

Dr. SENATOR (*Zeitschrift für Klinische Medicin*, Band i.) has given benzoic acid in forty-six cases of rheumatic polyarthritis. Small doses were given at first, in order to guard against irritant effects; and, finally, 10 to 12 grammes (150 to 180 grains) of the acid, or 12 to 15 grammes or more of benzoate of soda, were given daily; the acid itself in the form of powder, boluses, or capsules; the salt in a solution of 10 to 15 per cent. in aromatized water, with or without sugar. The results of the observations may be summed up by saying, that benzoic acid is a remedy of high value in acute articular rheumatism, though inferior to salicylic acid. Of twenty-two cases of acute articular rheumatism, twenty-one were cured within a period varying from two to seven days; in one case, where th disease was of longer duration, the time required was eleven days. The acti of salicylic acid is more decided than that of benzoic acid, which is grad Several cases in which salicylic acid had been given without effect or in which could not be tolerated, recovered under the use of benzoic acid. One point favour of benzoic acid was the fact, that in none of the cases treated were th any symptoms of irritation of the stomach, intestines, or other organs. In cases treated by it there were no relapses, nor cardiac or other complicatio Further experience, however, is required in order to determine whether ben acid, in spite of the comparative slowness and uncertainty of its action—fo failed in several cases—is to be preferred to salicylic acid on the ground of permanency of the cure and the absence of complications. The use of ben acid appears to be indicated in cases where salicylic acid or its soda-salt ei cannot be borne or fails to produce any effect.—*Lond. Med. Record*, Ma 15, 1880.

Syphilitic Muscular Contraction.

M. Cesbron, in his thesis (*Thèse de Paris*, and *Journal de Médecine et Chirurgie Pratiques*, November, 1879), has brought together a certain num of facts relating to a comparatively little known affection, syphilitic muscular traction. They concern those contractions which manifest themselves in course of syphilis, without appreciable lesion of the contracted muscle and constituent parts of the region. This affection is met with in the secon period of syphilis, sometimes also in the tertiary period, or at the same tim the so-called transitory symptoms. It may show itself in different muscle the masseters, in the gastrocnemius; but its favourite habitat is the bra biceps, for which reason it has been termed, by M. Mauriac, bicipital myop In this case, as M. Cornil has stated, it shows itself by stiffness of the elbow-j and the impossibility of complete extension of this joint. If this extensio increased, the biceps, which extends itself, is contracted, and opposes itself movement. Gradually the extension movement becomes more and more limit and the forearm remains bent over the arm at a varying angle, from the obtuse a very acute angle. The movements of the articulation are thenceforward v restricted, but the movements comprised in the limited angle of extension readily performed. It is a question of a contraction of the biceps, which is to be got over, and produces sharp pain when extension is forcibly made; there is nothing wrong in the joint. Palpation shows that the tendon of the bic is hard and stretched like a cord, and that the muscle itself assumes the roun form which it puts on when it contracts. Patients suffer at the same time, variable extent, and the seat of the pain is found either at the level of the elb bend, or at the circumference of the olecranon; in the lower limb, pain occup the popliteal space, and the upper extremity of the gastrocnemii. The gen phenomena observable at the same time are ruled by the syphilis; but it is uncommon to find pains appear simultaneously in some joints. Likewise, in certain number of cases, cold has appeared to be the occasional cause in the pr duction of this contraction. Syphilitic contraction presents somewhat consider ble differences in its progress: it never constitutes a very serious affection, b may last a long time, sometimes even for years. Thus the treatment is ve important, for its action is as quick in this as in other syphilitic manifestatio Mercury should be used when the contraction shows itself at an early stage, an the iodide of potassium when it puts in a later appearance.—*Lond. Med. Recor* March 15, 1880.

Syphilis of the Central Nervous System.

At a meeting of the Königsberg Association for Scientific Medicine (*Berliner*
Wochen., 1879, p. 407), Dr. NAUNYN discussed sixty cases in which the
ry of the patients had been accurately noted. Eight had been examined
-mortem. No exostoses (which during life are frequently set down as the
e of brain-symptoms in syphilis) were found. On the other hand, gummata
he brain-substance, subdural gummata softening as a sequela of endarteritis,
or without consecutive thrombosis, and simple softening, were ascertained
e present. Brain-symptoms frequently belong to the earlier manifestations
e disease. Naunyn has frequently seen it within the first year. Heubner's
tion, that intellectual and active men are particularly liable to this form of
se, does not appear to be borne out by Naunyn's experience. In general,
y be said that young persons are especially liable to syphilis of the brain.
there are any specific peculiarities about the disease, excepting the paralysis
e ocular muscles and pain in the head, Naunyn cannot admit. The only
cteristic point is that the usual symptoms occur in the young instead of the
An important diagnostic point is the absence of symptoms pointing to
ession (*stauungspapilla*, etc.). The usual symptoms are those pointing
ntre of disease; hemiplegia was common in Naunyn's cases, together with
is of the ocular muscles in many instances, which, as is known, rarely
n ordinary hemiplegia. Epilepsy is not uncommon. Charcot's assertion
mi-epilepsy is particularly characteristic of syphilis, is not borne out by
n's experience. He has never seen a case. Paraplegia occurred in eight
out of the sixty; once the group of symptoms pointed to hemiplegia
. The prognosis of brain-syphilis is, according to Naunyn, always
l. The number of cases which entirely recover is very small. In any
owever, the prognosis is more favourable than when the same symptoms
e to any other cause. Naunyn uses mercurial inunctions, and only
ys iodide of potassium occasionally.—*London Medical Record*, March 15,

---

Rapid and almost Universal Paralysis with Recovery.

a recent meeting of the Clinical Society of London (*Lancet*, March 20,
, Dr. BUZZARD read notes of a case of Rapid and almost universal Paral-
volving the four Extremities and both sides of the Face, Respiration and
ition; Recovery. The patient, a sparely-built man, forty-four years of
en admitted under Dr. Buzzard's care at the National Hospital, pre-
double facial palsy. His face was devoid of expression; he could not
nor frown, and the saliva dribbled from his mouth. There was also com-
palsy of the external rectus of each eye. The tongue was tremulous, but
sted. He could not swallow solids, except with difficulty; but fluids did
egurgitate. The sterno-mastoids were flaccid. Respiratory movements
upper thoracic, and they were not aided by the sterno-mastoids. There was
loss of control over the sphincter ani. As to the limbs, he could just move
ms sufficiently to feed himself, but otherwise they were powerless, though
asted. He was unable to stand, and there was great muscular flaccidity in
gs. The patellar tendon-reflex was absent in both legs.—*Cutaneous Sensi-*
. Over both sides of face there was loss of tactile sensation, but heat and
were differentiated. On the extremities there were defined areas of anæs-
a.—*Smell.* Assafœtida and sumbul could be recognized by right nostril, not
e left.—*Sight.* Muscæ; diplopia; fundus oculi normal.—*Hearing.* Nor-
—*Taste.* Neither sugar nor salt could be perceived on either side of tongue.

He suffered from sharp pain in the right thigh. The urine contained no al men. The history of the case was as follows: A month previously his face noticed to be drawn to the right. Then he began to have sensations of "p and needles" in the hands and feet; then his legs failed him. Next he power in swallowing, and, lastly, his arms got weak. There was no history blow or other injury, or exposure to cold, nor of any throat affection, nor of having been in the vicinity of any one suffering from sore-throat. When twe four years of age he contracted syphilis, but had no marked manifestation of disease. He was given ten grains of iodide of potassium every four hours. provement soon set in, and about a fortnight after admission he was ord mercurial inunctions, the dose of the iodide being increased to fifteen gr Ten days later the anæsthesia was much diminished, and a considerable am of power had been regained; and in about another ten days he was able to When discharged three months after admission he could walk fairly well; the patellar tendon reflex was still absent. A note three weeks later stated he could then walk three or four miles, and that there was decided patellar re in the right leg.

Dr. Buzzard remarked that this seemed to be one of the cases of " ascending paralysis," without muscular atrophy, first described by La which in the majority of instances terminated in asphyxia from paralysis of respiratory muscles. Erb, who remarks that the disease may progress d wards from the bulb, says that as a rule there is a very slight disturbance of sibility, so marked a feature in this case. The lessened muscular excit was also peculiar. Dr. Buzzard compared the case to one he had brought the Society in 1874, which he believed to have been syphilitic in origin. spinal origin of the disease was evident from the absence of patellar refle widespread paralysis, and the diminished irritability to the induced curre it were a myelitis it must have involved the posterior as well as the anteri nua, or it might be produced by some thickening or exudation in the pia In the case he had previously recorded he thought the symptoms might been produced by a pachymeningitis, but he rather doubted this from subse experience. He had had two other similar cases. In all but one there strong history of syphilis. The rapidity with which they all recurred under syphilitic remedies was in favour of their being due to that disease.

Dr. S. Mackenzie said the case was a most peculiar one. There must been some lesion in the cord itself. About ten years ago he had seen two ca sudden and severe universal paralysis, both fatal. One was a case of a youn who after severe headache was attacked with vertigo and brought to the L Hospital partially insensible and completely paralyzed. Drs. Ramskill, S and Hughlings Jackson examined the case. Sensibility was retained, ther no change in the optic nerves, the extremities were livid. She was bled to ounces, with temporary relief. After death no gross change was found i nervous centres. Another case, about the same time, was that of a man wh suddenly seized with paralysis in all his limbs, followed by tonic spasms, a tetanic in character. Here again no change was found after death. He tioned these cases to show to what an obscure class they belonged, and how cult it was to decide the seat and nature of the lesion. Indeed, it was difficult with our present knowledge to determine what lesion would accou all these symptoms.

Dr. Mahomed had seen a somewhat similar case with Dr. Broadbent years ago. It was not so severe a case as Dr. Buzzard's. A young man taken suddenly ill, with intense vertigo, great weakness, and almost con hiccough. For two or three weeks previously he had suffered from heada le became more or less paralyzed in the lower limbs; his face was expression-s and the pulse irregular. The case is published in Dr. Broadbent's lecture "Syphilitic Nervous Diseases." The patient recovered rapidly under anti-philitic treatment; but for weeks afterwards he had disordered sensation—*e. g.*, en in a cold bath one-half of his body felt hot and the other cold, and *vice versâ*. e marked feature was the intensely offensive character of the urine as soon as sed. There was no retention, and it appeared as if the urine underwent some emical decomposition shortly after its excretion. The fundus oculi in this case normal.

Dr. **Buzzard**, in reply, said that the anæsthesia of the skin of the face was t complete, but he had no note of the condition of the mucous membranes. asked Dr. Mackenzie if there was any reason to suspect syphilis in his cases, ch apparently belonged to the same category.

r. **Mackenzie** said there was no evidence of syphilis in either of them.

r. **Greenhow** remarked upon the analogies presented by the case with those evere diphtherial paralysis, of which he related an instance where there was plete palsy of limbs, face, and tongue. Although there seemed no doubt Dr. Buzzard's cases were due to the syphilitic poison, yet it was interesting te their similarity to those due to diphtheria.

Diabetic Coma.

ofessor **Quincke**, of Kiel, contributes a paper on this subject to the *Ber-Klin. Wochenschrift*, No. 1, 1880, with special reference to a case of well-ed hereditary diabetes in a girl of sixteen, which terminated after several ths' observation in the following way: Two days before death the patient suddenly seized in the early morning, after a very copious movement of the ls, with great weakness and desire to sleep, which lasted the whole day. In vening she became very excited and frightened, was delirious, and screamed y. She then gradually passed into a state of stupor, at first answering when en sharply to, but afterwards becoming quite unconscious and incapable of lowing, with very laboured respirations. In this state she died.

rofessor Quincke considers that the term "diabetic coma," which was first oduced by Kussmaul (*Deutsches Archiv für Klin. Med.*, 1874), should be ed to the train of nervous symptoms just described. Kussmaul supposed such symptoms depended on the presence of some poisonous material, prob-acetone, in the blood. In the present case, not only towards the end of the t's life, but also several months earlier when she suffered from sleepiness yspnœa without objective lung symptoms, the urine on treatment with per-de of iron became of the colour of red Burgundy wine, a reaction which been supposed by Gerhardt and others to indicate the presence of diacetic r $(C_6H_{10}O_2)$ in diabetic urine. Professor Quincke, however, observed that urine of his patient had not the characteristic smell of this ether, and further while normal urine to which even $\frac{1}{1000}$ part of it had been added smelt dis-ly, it was necessary to add more than one or two parts per thousand of the r to the diabetic urine before it smelt at all. He concludes, therefore, that patient's urine contained some substance which combined with the diacetic r until saturated by the latter, but experiments showed that this substance not an alkali, grape-sugar, nor one of the normal constituents of the urine. fessor Quincke has also found that though the physiological effects of diacetic r on animals somewhat resemble, they are not precisely the same as the symp-s of so-called diabetic coma. Dogs, for example, become restless and stupid r large doses of the ether, and they suffer from well-marked dyspnœa with celerated breathing, which persists until death. On the other hand, the ether does not appear in the urine as such, nor does the breath, even after its injecti into the blood, smell of it. He therefore regards the substances which cause Burgundy-red colour with perchloride of iron in diabetic urine as one allied diacetic ether, but not identical with it. He also remarks that since the sy toms of "diabetic coma" in the few hitherto reported cases vary considerabl character and in their degree of intensity, just as do those of uræmia, it is pro ble that, as in the analogous case of the latter condition, "it is not *one*, several, substances which are formed in varying proportion by the abnormal sue-change which is taking place, and by their accumulation lead to toxic eff which, though capable of combination into one congruous picture, vary indiv ally much more than, for example, the symptoms of poisoning by any partic alkaloid." The whole tenor of Professor Quincke's paper is to show how we yet understand the true *rationale* of diabetic coma, and there is eviden wide field open for investigation in this as in other branches of patholo chemistry.—*Med. Times and Gazette*, Feb. 28, 1880.

Osseous and Articular Lesions in Locomotor Ataxy.

At a recent meeting of the Pathological Society of London (*British* M *Journal*, Feb. 14, 1880), Dr. **Buzzard** exhibited three patients suffering osseous and articular lesions in the course of locomotor ataxia. The histo one of these patients, a man, had been published. He was a typical examp tabes dorsalis, in whom the right hip-joint was completely disorganized head and neck of the femur having entirely disappeared) within a space pro of three months. He presented besides a curious bony process, nine inches developed in the superior tendon of the rectus femoris muscle of the same Of the two other patients, one was a widow, aged 50, an in-patient o National Hospital for the Paralyzed and Epileptic. The patient, who ha fered for about eleven years from typical lightning pains in her legs and had been affected for an equal time with attacks of the *crises gastriques* of cot, attacks in which there was pain in the stomach and chest, with con retching and vomiting, occurring at irregular intervals. Other symptoms of which she presented were ataxic gait, very small pupils not reacting to analgesia of the extremities, defective muscular sense, and absence of pa tendon-reflex. In October, 1878, whilst walking quietly along the ward right femur was fractured through its neck. In July, 1879, whilst retchi bed, the left hip-joint suddenly "bulged out." Since then, she had been u to use either leg. Mr. Adams, who examined the patient at Dr. Buz request, reported the movements of both hip-joints free, but limited in directions, with crepitation more marked in the right than in the left. O right side, the top of the great trochanter was nearly level with the an superior spinous process; and on the left, the trochanter was extremely pr nent and the bone enlarged. The conditions observed might be due, he tho either to spontaneous fracture of the neck of the bone on each side, or to plete disorganization of the joint with atrophic changes and absorption of the and neck of the bone on the right side, and similar changes on the left, associ with enlargement of the great trochanter from throwing out of new bone. other patient was a married woman, aged 36, an out-patient of the Nati Hospital for the Paralyzed and Epileptic. For the opportunity of observing patient, Dr. Buzzard was indebted to Mr. Henry Smith, under whose care had previously been. Like the other woman, she had been subject (for upw of ten years) to attacks, not only of typical lightning pains in her extremi recurring at intervals of a month or two, and lasting three or four days, but of very characteristic *crises gastriques*. These occurred at irregular interv etween which she felt quite well. Her other symptoms had been staggering it, diplopia, inability to stand with the eyes shut, partial colour-blindness, pils insensitive to light, analgesia of the extremities. Three years ago, the ht leg became red and swollen, though not painful; these symptoms subsided der rest, but in June, 1878, they recurred. In September, the swelling had e down, but the knee-joint was useless. At the same time, the left leg began swell, and was larger than natural when she was admitted into King's College spital at the end of the year. During her residence of one month in the hosl, the left leg became dislocated outwards and backwards on the femur. The cles of the lower extremities were wasted. The patient was discharged at end of January, 1879, with leather supports to each knee, which enabled her ove about with help. Mr. Broster, resident medical officer to the hospital in een Square, reported that it felt as though all ligamentous connections had ppeared from the right knee-joint. The ends of the bones could not be ght into apposition, and they were so loosely connected that the patient, re she put on the leather casing, had to bandage them together. It seemed hough the condyles had been bevelled off, and the end of the femur turned a rounded and smooth stump, whilst the upper end of the tibia was bevelled wards. The patella was two inches above, and to the outside of, the end e femur. Along the outer side of the inner hamstring was a firm, smooth, led mass, one inch by half an inch. On the left side, the tibia and fibula dislocated backwards and slightly outwards. The condyles were rounded e inner one being enlarged. The patella lay over the end of the femur in . The right shoulder had lately shown swelling, and there was crepitus on ment.

. Buzzard remarked that, although nearly twelve years had elapsed since ot first described the arthropathy which was apt to occur in tabes, the subhad hitherto engaged but little attention in England. The first case ded in England was by Dr. Clifford Allbutt in the *St. George's Hospital rts* for 1869. The second was published by Dr. Buzzard in the *Lancet*, t 22, 1874. It was a typical example of tabes, with enormous swelling isorganization of the knee-joint, which began when the patient had been ed at least five years with the disease, and proceeded with great rapidity. es the four examples which had occurred in Dr. Buzzard's practice, he had a few others of similar nature, but less broadly characteristic. In 1873, Dr. Mitchell[1] alluded incidentally to the frequency of fractures in tabetic ts; and about the same time Charcot brought to the Société Anatomique ris the case of a woman (affected with tabes dorsalis) in whom, concury with great disorganization of certain joints, multiple spontaneous fractures e neck of the left femur and of both bones of both forearms had occurred. e present time, Charcot was disposed to consider the joint-changes and the aneous fractures as secondary manifestations of the fault of nutrition of the ous tissue, dependent on an influence of the nervous system. According to , the extremely rapid wearing away of the articular extremities was the prinl character which distinguished tabetic arthropathy from arthritis deformans. cases of spontaneous fracture due to tabes, it was common to find a more than lly exuberant callus thrown out. In the three patients present, there were, d been, all the conditions which had been described as characterizing the ous and articular lesions of locomotor ataxia. Extensive swelling, more often not painless, and never confined to the joint itself, but extending also down long axis of the limb, disappearance or disablement of the articular ligaments, rapid erosion and absorption of the ends of the bones, were the features which marked two of the cases. In the other, spontaneous fracture certainly of one femur and, as he believed, also of the other, was coupled with the formation of what was probably a voluminous callus. The *crises gastriques*, which were comparatively rare in tabes, were frequent in cases of arthropathy. Altogether, in eight out of twenty-one cases of arthropathy, *crises gastriques* were also present. As the gastric symptoms were probably due to sclerosal invasion of the roots of the vagus nerve, Dr. Buzzard suggested the probability that change in some structure contiguous to them in the medulla oblongata might be the lesion giving rise to the altered nutrition in the osseous system, and he thought that it was in this quarter that pathological anatomy might usefully direct its energies.

---

[1] American Journal of the Medical Sciences, July, 1873, p. 113.

Dr. GOWERS showed an elbow-joint from a patient with locomotor ataxy (aged 45), who, four years after the disease commenced, and when the symptoms were well marked in both arms and legs, fell, striking the elbow. He used the arm next day without inconvenience, but the joint rapidly swelled, and a medical man whom he consulted thought some bone had been broken. Two months later, when seen, the joint was enormously swollen, fourteen inches in circumference, abnormally mobile, and loose bone could be felt. There was not, nor had there been, any pain. The swelling slowly lessened. Six months later, he died from a painless but extreme pleural effusion. The cord presented the usual lesion. In the elbow-joint, the external condyle of the humerus had been split off, and the coronoid process of the ulna was also fractured. The ends of the bones had lost most of the cartilage and were eroded. The synovial membrane was covered, between the bones, by villous projections, some fine, others large. There were also two pieces of bone which could not be accounted for by fracture; one, about half an inch square, was above the coronoid process, and projected into the cavity of the joint; the other was a plate of bone in the outer wall of the synovial sac, about an inch square, but apparently in two pieces.

Mr. HUTCHINSON exhibited a series of casts of bones presenting changes in locomotor ataxy, which had been sent over by Professor Charcot. There were the bones forming an elbow-joint which showed all the changes described by Dr. Gowers. Another cast showed a wearing away of the upper part of a femur, associated with an ununited fracture of the neck of the bone. A third showed extreme shortening of a femur after fracture. He showed also some casts taken from a living patient in the Salpêtrière. The left humerus was dislocated beneath the clavicle, the head of the bone being apparently little altered. There was no pain in the joint, and the arm could be freely moved in all directions without pain. The opposite humerus was dislocated on to the dorsum of the scapula, the head of the bone being partly absorbed. There was dislocation of the right knee-joint, the tibia and fibula being twisted out and displaced upwards behind the femur, the lower end of the latter bone being also partially absorbed. He had seen a case of locomotor ataxy which had begun with severe *crises gastriques*, that rendered the patient quite unable to work. This symptom passed away, and was followed by pain and weakness in the right hip-joint, which symptoms were attributed to rheumatoid arthritis. Three years later, amaurosis set in, beginning with defective sense of colour, and rapidly going on to blindness, with white atrophy of the disk. Subsequently, many other symptoms of locomotor ataxy became developed, and the condition of the right hip was such that either dislocation on to the dorsum ilii and absorption of the head must have taken place, or there existed an ununited fracture of the neck of the femur. The patient had latterly very much improved, and, except that the right leg was considerably shortened, he walked about very well. The President narrated another case which had been under observation for fifteen years. The symptoms began

ith amaurosis, which, however, never became complete. Subsequently, various
mptoms of locomotor ataxy developed. The patient walked with a limp.
ter death, an ununited fracture of the neck of the femur was found. There
s no history to show when the fracture had taken place.

Mr. Macnamara thought the disease of the bones was probably the result of
synovial distension rather than of any central nervous condition. He consid-
ed the condition to be not unlike that seen in chronic rheumatoid arthritis.
narrated a case of joint-disease occurring in locomotor ataxy that had come
der his own notice.

Dr. Allen Sturge narrated a case of locomotor ataxy which had been re-
tly under his care, in which the earliest symptom was the occurrence of *crises*
triques of a very intense character, lasting over a period of three years.
e were followed by great enlargement in the right knee-joint, and somewhat
r by very well-marked symptoms of locomotor ataxy. The knee-joint recov-
without much alteration in the bones. He had seen two cases of spontaneous
ture in locomotor ataxy; in one case, a man with well-marked symptoms of
disease had fractured the right femur at the middle of the shaft whilst putting
is boot, and he had subsequently fractured the left leg by an equally slight
ement. Both fractures had reunited. The other case was a woman in the
étrière, who had sustained a spontaneous fracture in the left leg whilst under
ation, and a few days later had fractured the right humerus, whilst trying
ve her position in bed.

. Broadbent had treated one of the patients exhibited by Dr. Buzzard
gh some of the earlier stages of her illness, and he gave further details of
se, a remarkable point being that, during her attacks of gastric pain, she
ntly ran about the ward without giving any sign of ataxy of the legs. He
ot inclined to accept Dr. Buzzard's view of the connection of the *crises*
iques with joint-disease. He had seen six cases of *crises gastriques* associ-
with locomotor ataxy, and in only one case was there joint-disease.

r. Buzzard, in reply, said he was prepared to find that surgeons would not
der there was anything remarkable about these joint-affections. In rheuma-
rthritis, in by far the larger number of cases, the smaller joints were first
ted, but they were never affected in locomotor ataxy. The amount of liquid
ed in the latter disease was often much more than was seen in rheumatoid
itis. In many of the cases of ataxy, moreover, there was a remarkable
gression, which did not occur in anything like the same degree in the
atic affection. The rapidity with which the changes were produced in
was also peculiar, a few days sometimes sufficing for the complete destruc-
f a joint. He agreed with Mr. Butlin in thinking that probably all the
tures of the joints might be primarily affected.

On the Treatment of Chronic Dysentery.

r. C. H. Ralfe, Senior Physician to the Seaman's Hospital, concludes a
tical paper on this subject (*Lancet*, Feb. 28, 1880) with the following sum-
y:—

he castor-oil treatment may be advantageously employed in all stages of the
ase—either at an early period, when the disease is subacute and the ulcera-
still extending, or when the process of repair is going on, and we are deal-
merely with an ulcerated condition of the bowel; or when the ulcers have
led, and there remains a thickened and contracted condition of bowel, caused
cicatrization, with a mucous surface extremely liable to catarrh. It is appa-
tly beneficial by causing a soft non-irritating flux from the small intestines,

which sweeps before it scybala, decomposing shreds of mucous membrane, or food, and offensive discharges accumulated in the lower bowel. It is not improbable, in addition to this mechanical action, that the flux from the small intestine may have some remedial action on the ulcerating surface analogous to that said to be produced on the inflamed mucous membrane of the bladder by the injection of normal urine. In the later stages of the disease, when cicatrization is completed, or nearly so, castor oil relieves the constipation, the consequence of the thickened coat and diminished calibre of the bowel, and it also appears to diminish the tendency to catarrhal relapses. With respect to the dose, in twenty-one cases two drachms of the oil were administered every alternate night. Of these, six were discharged cured. In the remaining seventeen cases the oil was given twice a week in half-ounce doses, and the number of cases discharged cured amounted to eleven. Each dose of castor oil was guarded by the addition of eight drops of laudanum. The administration of castor oil does not usually lead to an immediate diminution of the number of stools, its first effect being to improve their character. By the end of the first or second week the stools become more feculent and less offensive, and the tormina and tenesmus are less urgent. The stools then gradually fall in number, preserving often a regular gradation, interrupted, however, by repeated relapses, each relapse, if treated promptly with ipecacuanha, being more manageable and of shorter duration.

When castor oil alone was relied on, the results were not so satisfactory as when either a mixture of bismuth or hæmatoxylon was given at the same time, or at some period during treatment. Indeed, the most satisfactory results were obtained with half an ounce of castor oil administered twice a week, and a mixture of hæmatoxylon given three times a day. I cannot, however, at present come to any decision with regard to the respective merits of bismuth and hæmatoxylon. In the majority of the cases treated with bismuth the castor oil was administered in two-drachm doses, repeated every other night, and the cases treated with hæmatoxylon with half-ounce doses of oil only twice a week. The more favourable result obtained with the latter treatment may be due to the larger but less frequent dose of oil. Both have a different action, bismuth diminishing the catarrh of the mucous membranes in the neighborhood of the ulceration; hæmatoxylon[1] by restraining undue peristaltic action throughout the intestinal canal, allowing digestion to be more completely performed, and in this way improving the general nutrition, and diminishing the irritation of the ulcerated surfaces by lessening the passage over them of undigested matters. In four cases turpentine was administered in conjunction with the oil. Turpentine seems to be indicated where we have a large ulcerated surface, and the discharge is offensive. A considerable number of cases treated solely with turpentine were collected for me by my friend, Dr. Andrew Duncan, when house-physician at Greenwich, the notes of which I have unfortunately mislaid, or I would have appended them to this paper. The results obtained were encouraging, but, as the turpentine was sometimes uncertain in its action, I have not continued its use, except occasionally as a supplement to castor oil.

With regard to the topical application of substances to the ulcerated surface by means of injections, in only one of the cases quoted was this tried, the administration of the oil being stopped during the case. The injection, which consisted of bismuth, was given twice with the effect of at once increasing the number of stools, and adding greatly to the patient's distress. The enemata were at once discontinued, and the castor-oil treatment resumed, and the patient made a good recovery. In other cases where I have tried bismuth injections, and injections of other substances, the results have not been encouraging. In some cases where ulceration was low down in the bowel the injections sometimes seemed to do good.

---

[1] Hæmatoxylon, according to Pereira, though classed as an astringent, does not constipate or disorder the digestive functions.

Ipecacuanha powder was given in large doses in seven cases, six for relapses uring castor-oil treatment, and in one case on admission. The dose ranged om twelve to twenty grains of the powder. In two cases in which the larger se was given vomiting was produced; but with fifteen grains nothing beyond feeling of nausea was complained of. Ipecacuanha is indicated whenever in e course of treatment the stools that had become feculent begin to lose that aracter, accompanied or preceded by abdominal pain and tenderness, with an crease of blood and slime in the stools and a return of tenesmus. A very sud- n diminution in the number of stools passed daily is often a premonitory indi- tion that a relapse is about to occur. As each relapse adds to the already isting debility and protracts the disease, it is of the utmost importance either prevent their occurrence or cut them short if they have occurred. There- e, at the first indication, a full dose of ipecacuanha powder should at once be en. If administered sufficiently early the urgent symptoms will be found to s away, and the character of the stools improve, generally at the end of nty-four hours; but if delayed till the relapse is well established it will be days re the patient will recover lost ground. Too much importance, therefore, ot be laid on the *necessity of watching for the earliest indication of a re- e*, for on its early recognition and prompt arrest depends the ultimate suc- s of all treatment of chronic dysentery.

All cases complicated with constitutional conditions, such as syphilis, ague, mia, scurvy, and the like, call for appropriate treatment in addition to that ired for the dysentery. With reference to the use of iron, the solution of pernitrate agrees very well with most patients. Some, however, are very lerant of iron in any form administered by the mouth. In these cases it may advisable to try the subcutaneous injection of the dialyzed solution.

Rest and strict attention to diet are essential to the cure of chronic dysentery. long as there is tenesmus and much straining, and the stools contain blood slime, the patient should be confined to bed, or at least remain in the hori- tal position. When the stools become feculent he may be permitted to sit up a few hours daily, but till the stools have become consistent he should not be mitted to go out of doors; even then only in dry, warm weather. Exposure ld and damp almost invariably causes a relapse. Nourishment should be n only in small quantities at a time. When the symptoms are subacute, f-tea must be chiefly relied on, and if the exhaustion is great fluid extract of at, or juice of raw beef, must be freely administered. As the more urgent mptoms subside, boiled fish may be given, and then minced meat (made from sh, not cooked meat). The effect, however, of the changes to a more solid t should be carefully watched, for if given too soon, or in too large quantities, will provoke a relapse. The best way is to begin with a very small ration, d increase it daily. Farinaceous food should be given in very small quantities, at all. The digestive powers being usually enfeebled in chronic dysentery, me portion of the starchy matter may escape conversion into sugar, and, by composition in the large intestine, the unconverted starchy material will give e to flatulence, and to the formation of lactic acid. The same caution is neces- sary with regard to milk, which if not speedily absorbed, rapidly undergoes lactic acid fermentation. Coffee and alcohol in any form are injurious, and should be abstained from. Fresh fruits in small quantities and lime-juice are benefic especially if there is a scorbutic taint, which is very common.

Double Abscess of the Liver Discharging through the Right Kidney and th Bladder.

LACAZE reports (*La France Médicale*, December, 1879) a case of abscess the liver opening through the kidney, which is certainly rare and deserving record. The patient, a young man, aged 24, was a native of the Island of union, but had lived in France since his fifth year. He first came under notice of the author in August, 1878, when he presented himself for exami tion in order to find out whether he had been properly cured of a pleurisy of right side, for which he had been treated. At that time he still had a little in the side, but no cough or difficulty in breathing, though he was very thin pale. An examination of the lungs failed to reveal anything wrong, and Lacaze accordingly gave it as his opinion that the pleurisy had completely solved. He did not see the patient again till the following November, whe was called to attend him, and found him presenting the following symptoms: was very much emaciated, the skin was hot and of a pale yellow colour, he no appetite, and had occasional diarrhœa; there was well-marked and cons pain in the right side; the pulse was 120–125. The liver extended below border of the false ribs and was tender to the touch. The pain was relieve the application of a blister to the right hypochondrium, but two days later a sl prominence was noticeable in this region and careful palpation revealed de seated fluctuation. On the fourth day, on visiting his patient, Dr. Lacaze fo him much improved, and was informed by him that he had passed a large q tity of urine during the previous night, and on examining a specimen of i found it to contain a considerable amount of pus. The prominence menti above had disappeared. The patient continued to improve after this for a time, but towards the end of January, 1879, all the symptoms returned with creased violence, and on examining him it was found that the prominence ha appeared, fluctuation could again be noticed, and the urine, though generally c contained pus from time to time. Two days later the tumour had increased much in size and an exploratory puncture proved the presence of pus. A repeated applications of Vienna paste, the abscess, being then close to the face, was opened, and the escape of 900 grammes of thick chocolate-colou pus left no doubt of its being connected with the liver. A drainage-tube inserted to a depth of 10 centimetres, the cavity washed out twice daily wi solution of carbolic acid, and a preparation of iodine and Vichy was given ternally. The suppuration diminished gradually, though the pus still maintai the same character, and finally a fistulous opening was established and kept by pieces of lint. The pus in the urine was of a pale yellowish color. All unfavourable symptoms disappeared. At the solicitation of his family, the pati returned to Réunion; on the voyage the suppuration increased, and after rea ing home, he died of exhaustion at the end of a month. No necropsy was ma In his remarks on the case, which he presented before the Society of Practi Medicine at Paris, the author calls attention to the rarity of this mode of d charge of an abscess of the liver, though similar cases had been reported, amo others by Rayer and Neumann. He has seen two cases of abscess of the li which had opened into the bronchial tube, and a cure followed; but where discharge had taken place into the intestine, or where they had presented ext nally, and been opened either by the knife or caustic, a fatal result had alwa supervened. Taking these facts into consideration, though perhaps somethi ight be hoped for from Dieulafoy's aspirator, he was inclined to agree with the xperience of those who saw such cases frequently in tropical climates, that it as best to refrain from surgical interference, and allow them to follow their atural course.—*London Med. Record*, March 15, 1880.

Acute Nephritis in Typhoid Fever.

Dr. GREENHOW, at a late meeting of the Clinical Society of London (*Lan-t*, March 20, 1880), communicated notes of a case of Typhoid Fever with ute Nephritis and Profuse Hæmaturia without Dropsy. A porter, aged enty-one, was admitted into the Middlesex Hospital under Dr. Greenhow's e, on November 25, 1879, the fifth day of a fever, which set in with consid-ble severity, the second day of the attack being marked by vomiting, cough, d slight sore-throat; and in the night he began to have painful micturition, d noticed that his urine was almost black in colour. On admission, pulse 108; perature 103.2°; urine sp. gr. 1012, of a deep red colour, from admixture h blood, containing albumen—one-half, numerous blood-globules, blood and thelial casts. He was very prostrate, and suffered from muscular pains. re was impaired resonance with bronchial breathing and scanty crepitation at apex of the right lung, but no râles elsewhere. The cardiac second sound reduplicate. Abdomen was tympanitic, and there were tenderness and ding in the right iliac fossa. The liver and spleen were not enlarged. There no diarrhœa nor rose-spots. Cold sponging was ordered and a fluid diet. 9 P.M. pulse 126; temperature 104.6°. The illness ran a rapid course, tration increased, the pulse-rate ranged between 100 and 130; the tempera-97.6° to 104.8°. Restlessness and delirium, passing towards the close into nolence with occasional subsultus in arms and legs, were observed. The ue became dry and fissured. The urine continued to be blood stained, but the nt of blood and albumen diminished. The abdominal distension persisted, characteristic diarrhœa appeared on the 27th, continuing till death, which k place on December 8th, the thirteenth day of his illness. The autopsy ealed mitral thickening and enlargement of the heart, and marked pulmonary ostasis. Two or three sloughing ulcers occurred at the lower end of ileum, one in the healing stage, Peyer's glands and solitary follicles being elsewhere llen. Liver and spleen greatly swollen and softened. Kidneys, weighing lve and fourteen ounces respectively, were intensely gorged; their secreting les were filled with swollen granular epithelium, and between the tubules e was small-celled infiltration.

r. Greenhow remarked that he had not met with a similar instance. Albu-ria, when it occurs, is usually a late event in typhoid fever; according to bermeister, not until the fever has reached its height; and Murchison says it ly appears sooner than the third week, and is due either to congestion or to enchymatous degeneration, not as due to acute nephritis. Dr. Murchison also s that when copious hæmaturia occurs it is generally associated with other morrhages. The only parallel instance to the present case Dr. Greenhow had nd on record was a reference by Liebermeister to two cases of uræmia from te parenchymatous nephritis in the Basle hospital, in 1872, soon after admis-n, and during the height of an attack of typhoid fever. The most careful quiry failed to elicit any history of previous disease in the present case; so that seemed as if the trivial cardiac hypertrophy and mitral thickening were due to e very intense nephritis. The points then of chief interest were the concur-ence of typhoid fever with such intense nephritis, the entire absence of dropsy, nd the severe and rapid course of the disease.

Dr. CAYLEY said that of late years in the London Fever Hospital there h only been one case of typhoid fever complicated with acute nephritis, whi came on during convalescence from the fever. Two years ago a patient in t same hospital had profuse hæmaturia, but Dr. Cayley had never seen a case wi so rapid a course as that described by Dr. Greenhow. The presence of a heali ulcer would suggest that the period of the fever was later than was apparent.

Suppurative Pyelitis treated by Incision.

Dr. HABERSHON at a late meeting of the Clinical Society of London read t notes of a "case of pyelitis; discharge of pus; incision in the loin; recovery." The patient, aged twenty-eight, a carman, of phthisical stock, was admitted i Guy's Hospital on the 29th January, 1879. Four months before, he had noti blood in the urine, and had experienced pain at the end of the penis during m turition. For some time previously he had had pain in the left arm, side, a thigh. A month later a swelling appeared in the left loin, and the severity the pain compelled him to keep in bed. One night the swelling disappear and he passed about half a pint of pus with his urine, and continued passin little pus for three or four weeks. On admission, he appeared ill and distres his sleep was disturbed, and movement gave pain. There was tenderness in left loin; and dulness from the eighth rib to the crest of the ilium on this as well as fulness, but no defined swelling. Harsh breathing at apex of r lung, but no dulness except at the left base, where breath-sounds were ab The urine was clear, specific gravity 1022; free from pus, blood, albu sugar, or phosphates; it contained a few squamous epithelial casts. Eve temperature 102°. Morphia was given to relieve pain.

Diagnosis—disease of pelvis of left kidney, probably strumous; but it doubtful whether there had been tubercular disease at the commencement, the symptoms did not indicate calculus.

On February 8th six ounces of clear, light-green fluid, followed by two ou of pus, were withdrawn by means of a fine trocar and canula introduced bet the ribs and iliac crest. The fluid had a fetid odour; it contained no ure uric acid, nor hydatid, but pus-cells and fibrin. On the 14th the tempera was high; the tumour distinctly felt.

Mr. Davies Colley made an incision under carbolic spray in the left loin, ab three inches in length, just beyond the edge of the quadratus muscle. A fi thick-walled abscess was found and laid open, evacuating nearly two pints of The abscess extended beneath the ribs to about the eighth rib, and downw about two inches below the crest of the ilium, forwards to the edge of the rec Its walls were lined with calcareous material. A drainage tube was introduc and the wound dressed antiseptically. Quinine was given. On March 21st t perature 102°, the wound had healed, and Mr. Colley reopened it, evacuat half an ounce of pus. From that time he continued to improve, leaving pital on May 15th. The sinus was still left open, and he was directed to co to the hospital every third day, to have the side dressed.

Dr. Habershon remarked that the family history and appearance of the pati suggested the probability of tubercular disease. It was not easy to give a decid opinion as to the cause of the hemorrhage. The pain at the end of the pe suggested vesical irritation, as from calculus. Perhaps a calculus had block the ureter, and led to distension and suppuration in the pelvis of the kidney; the alternative view of tubercular disease or caseous inflammation, followed chronic suppurative pyelitis, was more feasible, and was borne out by the se calcareous state of the diseased pelvis. The relief afforded by the operation w marked that Dr. Habershon felt sure that had it been postponed the man ould soon have become exhausted, and he suggested that it might be more frently resorted to in such cases with benefit and the saving of life. It would e well if the whole gland could be safely removed. He mentioned a case of a an who, from the age of sixteen or seventeen, suffered from periodic discharges f pus from the bladder, the discharge of pus being preceded by the formation of large projecting sac, extending from the ribs to the iliac fossa on the right side. e lived to the age of sixty-four, dying from cancer of the remains of the kidy, and it was found after death that a calculus blocked the ureter, and that collected until the distension of the ureter made the passage free.

In a note appended to the case that had been read, Mr. Colley states that the mbered character of the sac indicated its being an enlargement of the pelvis. e discharge continued until the end of October, and when last seen in Novem- the wound had been healed two weeks, and no signs of any abdominal our remained.

Mr. **Golding Bird** endorsed Dr. Habershon's statement as to necessity for y operative interference, and further suggested that surgical aid might be had urse to for the purpose of diagnosis. In a case under his care, with painful ptoms of prostatic and probably also renal disease, where there was a swell- in the neighbourhood of the kidney, he cut down upon that organ, and lored it thoroughly. The operation gave no relief, but it was performed only iagnosis. When there were symptoms of calculus in the kidney, surgical might be called in to establish the diagnosis. It only required a simple ion, and the risk to the patient was *nil*.

r. **Walsham** said there was another method by which this end could be ined—viz., exploration by the whole hand in the rectum. Simon had thus cted stone in the renal pelvis. He (Mr. Walsham) had employed this hod in five cases, and had easily reached the kidney. He had never found ill result occur.

Dr. **Habershon** said there was sometimes great difficulty in distinguishing ween an abscess of perinephritic character and one of pyelitic origin. The e of operation was well illustrated in the case he had brought forward.— cet, Jan. 31, 1880.

Hyaline Degeneration.

A kind of degeneration of the vessels and substance of the lymphatic glands, h, although it has probably been observed in this country, does not appear ave been regularly investigated or named, has been recently described by **GER**, a pupil of Recklinghausen's, in *Virchow's Archiv* (vol. lxxviii., part age 25), and deserves the careful attention of pathologists. The disease, for ch the name of "hyaline degeneration" has been proposed, naturally prets different characters, according as it effects the vessels or the proper subnce of the lymphatic glands. When the former are the seat of the change, e smallest bloodvessels of the gland are found to be converted into hyaline bes, their wall being greatly thickened and their lumen narrowed. The hyaline terial possibly consists of a cellular infiltration of the vessel-coats, especially e adventitia. The final stage of the process consists of a diffuse calcification. emically, the hyaline substance is to be distinguished from the connective ues, and to be classed with the colloid materials. With respect to the cause this degeneration, the most important factors appear to be circulatory disturbnces in conditions of dyscrasia or senility.

The naked-eye appearances of glands, when their vessels are thus affected, are not characteristic until a section is made, when a perfectly typical picture is presented. Instead of the familiar characters of a lymphatic gland, there is se upon a somewhat congested ground, an extremely fine and delicate network whitish, more or less opaque, somewhat prominent trabeculæ, which divides t section into a number of small fields of tolerably normal appearance. To th fingers the trabeculæ feel firm and even sandy, and nodules occur at their poi of communication. Such networks are by far most abundant in the periph portion of the gland. The degeneration affects the different groups of gla very unequally; the lumbar glands apparently seldom escaping in any case, a the inguinal and axillary glands being next most commonly invaded, whilst t mesenteric glands have never been found involved. Altogether, Wieger fo the disease in ten cases in the course of 600 post-mortem examinations ma during a period of nine months.

With respect to the minute anatomy of the process, it is found to be confin to the follicular substance of the lymphatic glands, and never to invade t lymph-paths. The disease is readily referred to the capillary vessels, which a enlarged by thickening of their walls, whilst their canal is diminished or ev obliterated; and this by the presence of a highly refractive, translucent su stance which is not unlike the matrix of hyaline cartilage. Careful examina sometimes revealed traces of the tunica intima within the zone of new mate and even appearances of the remains of a tunica media, so that the degenera would appear to have its seat, in these instances, in the adventitia of the ca lary arteries. Treatment with staining fluids and other reagents failed to re the presence of nuclei or of anything resembling the contour of a cell in degenerated coat. The gland-tissue lying between diseased vessels may atrophied by pressure, but otherwise remains healthy. The process appear proceed from the centre of the lymphatic follicles outwards. The last stag hyaline degeneration seems to be calcification, and the removal of the calcar particles by means of an acid leaves the substance translucent as before. special interest is the reaction of the hyaline substance to the ordinary tests in morbid histology. Iodine solution colours it of a light straw-tint only, the amyloid reaction is entirely wanting. Water does not affect it; and mineral and acetic acids hardly cause it to swell, increase its translucency, bring out no nuclei in it. Alkalies produce marked translucency, so that substance becomes vitreous and absolutely amorphous, whilst it swells consi ably. It shrinks when boiled in water, and is not dissolved even when process is prolonged. Carmine, picro-carmine, and eosine stain it dee hæmatoxyline and aniline-brown not at all. From these reactions it may gathered that the hyaline substance is most nearly related to colloids, and little affinity with condensed connective tissue and no affinity with amyl material.

What is the genesis of this hyaline substance, and what are the beginnings the process? In a single case only Wieger found an appearance which m possibly represent the first stage of the change, namely, a fusiform swelling individual vessels, due to the development of cells which lay closely adherent the vessel-wall and to each other, not unlike leucocytes, or fused together in su a manner that their contours were indistinguishable. Careful examination r vealed that the cells were actually an infiltration in the adventitia of the vess and that, where the cell-contours had disappeared, the resulting masses bore strong resemblance to the "hyaline" substance. But whether this appearan actually advances to hyaline degeneration, Wieger declares himself unable determine. Wieger believes that this hyaline degeneration has no relation the arterio-capillary fibrosis of Gull and Sutton. It is probably almost identic in most of its characters with the peculiar change which is found in the vessels he cortex cerebri and pia mater in dementia paralytica; but there is at present o evidence that the two processes occur at once in the lymphatic glands and in e cerebral vessels—that is, that they are one and the same.

Besides the hyaline degeneration of the vessels of the lymphatic glands just scribed, Wieger twice met with a somewhat similar, if not identical, change in e proper tissue of the glands, which, however, he believes to be due rather to chronic inflammatory process. When the process is advanced, the glands are olutely white or grayish-white, highly anæmic, and not unlike amyloid liver consistence. The subjects of the disease had died in both instances in a conion somewhat resembling acute tuberculosis.—*Medical Times and Gazette*, rch 27, 1880.

Estimation of Uric Acid by its reducing Action upon the Ammoniated Cupric Test.

At a late meeting of the Royal Medical and Chirurgical Society (*Lancet*, April 1880) Dr. F. W. PAVY read a paper on this subject, of which the following is bstract.

he author first refers to the importance of being able to determine readily and precision the amount of uric acid voided for the purpose of studying the cons which tell favourably and unfavourably upon the uric-acid diathesis, and as ide to treatment during the management of a case in which the uric-acid deoccurs. The old methods of estimating uric acid could not be spoken of as ing the requirements of the medical practitioner either as regards facility of cation or precision. The method which the author desired to bring before notice of the Society is founded upon the reducing action which uric acid, like , exerts upon the oxide of copper. The ordinary form of copper test is most ptible of application to the purpose, but the ammoniated cupric liquid, which author has recently introduced[1] for the quantitative determination of sugar is ctly available. With this test the reduced oxide, instead of falling as a prete, is held in solution by ammonia, and a simple decoloration of the liquid s as the reduction proceeds.

he mode of preparation and employment of the test having been described, it ted that the results obtained from observations conducted with known quanof pure uric acid so closely harmonized with the expression that three atoms ide of copper are reduced by one atom of uric acid, as to justify this formula g adopted as the basis of calculation for the process. For the determination e uric acid in a specimen of urine the reducing power is taken before and treatment with acetate of lead. The first or total reducing action is in part o uric acid and in part to the small amount of sugar which urine naturally ins. The addition of acetate of lead effects a precipitation of the uric acid, the reducing power now obtained represents the reducing power of the urine, s that of the uric acid it contained. By the difference between the two deinations the amount of uric acid is ascertained. The mode of calculation is n. Results are furnished showing the precision with which known quantities ic acid added to urine are revealed by the process. To be certain that what ken as expressing uric acid is in reality due solely to the presence of uric acid, process was checked against the actual collection and subsequent determinaof the uric acid. Results are first given to show that the collection and subent determination of uric acid can be carried out in a manner to afford reliable rmation, and then the two processes, the determination from the difference the reducing power before and after precipitation with acetate of lead, and by actual separation of the uric acid, and its subsequent estimation, were applied to various specimens of urine, and the results compared. The figures obtained present a close accord, and justify confidence being placed in the results derived from the process brought forward.

---

[1] Proceedings of the Royal Society, vol. xxviii. p. 260, and vol. xxix. p. 272.

The author thus concludes his communication: "This completes what I have to say about the process I have described for the estimation of uric acid. The next matter to deal with is the result obtained by its application to the urine under various conditions of health and disease. This is a matter of some magnitude which I must reserve for the subject of a future communication, but I may here state that, according to the observations I have conducted, the figures that have been hitherto given as representing the amount of uric acid present will have to undergo considerable alteration." Dr. Pavy then exhibited the process above described to the Society, and further added some interesting remarks upon the estimation of the acidity of the urine by means of phenol-phthaline, a test which he also exhibited. He said that he had made comparative observations upon the amount of uric acid and the acidity, but his conclusions were not numerous enough for generalization.

Pilocarpin in the Treatment of Prurigo.

Professor OSCAR SIMON, of Breslau (*Berliner Klinische Wochenschrift*, No. 49, 1879), has used preparations of jaborandi with good effect in cases of prurigo both in adults and children. Hebra's prurigo, which is a rare disease in England, is comparatively common in Breslau, and forms about 3 per cent. of the non-venereal cases in the skin clinic of the University; this method of treatment, therefore, is of less interest to us than to the Germans, but it deserves at least a short mention here. Either subcutaneous injections of one gramme of a 2 per cent. solution of hydrochlorate of pilocarpin or a syrup of jaborandi were used. The latter is an infusion of three parts jaborandi leaves in fifteen parts boiling water, filtered and mixed with eighteen parts sugar. The dose for an adult is two or three tablespoonfuls, for small children a teaspoonful, for older children two teaspoonfuls. After the dose the patient was always wrapped up in blankets for two or three hours. The salivation and other well-known effects of pilocarpin accompany the sweating, which seems so valuable to the pruriginous patients. Professor Simon compares its influence to that of a bath or an ointment. It softens the dry, harsh skin, and probably relieves the openings of the sweat-ducts of the accumulations of epidermis which, as the microscope shows, blocks them in prurigo. On the average, a fortnight's pilocarpin treatment temporarily cures moderately severe cases of prurigo, while a month suffices for all but the very worst. We need scarcely add that it does not permanently cure; relapses occur as under other plans of treatment. Professor Simon has not found pilocarpin of use in other skin affections. In two or three cases of alopecia the result was undecided. He makes some valuable remarks in the second part of his paper on the natural history of true prurigo; especially he points out the difficulty of diagnosing it accurately in the early years of life owing to the similarity of the lesions to those of infantile prurigo (*Lichen urticatus*). He considers that we cannot be absolutely sure of the diagnosis before the end of the fourth year. "A prurigo which runs on after this is incurable." We quote Professor Simon's conclusion without comment, except that we must not be understood to give it our unqualified assent. As to etiology, he agrees with Hebra that the parents of the pruriginous, and especially the mothers, are often phthisical, but he has never seen a case of hereditary transmission, though more than one child in the same family is sometimes affected.—*Med. Times and Gazette*, Feb. 21, 1880.

Surgery.

Relief of Pains in Locomotor Ataxy by Nerve-Stretching.

LANGENBUCH (*Berlin. Klin. Woch.*, No. 48) relates a case of well-marked
d very painful locomotor ataxy, in which the acute and sudden attacks of ago-
ing pain caused the patient great suffering in spite of sedatives. Langenbuch,
his case, finding that the left sciatic nerve was specially affected, tried stretch-
of this nerve with the best results. The wound healed under antiseptic pre-
tions by first intention; the motor and sensory paralysis disappeared after a
days, and the pains did not recur. Encouraged by this, Langenbuch ope-
d also on both the crural nerves and the right sciatic nerves in the same way,
with the same happy effect on the pains. When the patient made his first
pt at walking, he asserted that he now knew again what he had under his
, and that he could walk better; and Langenbuch ascertained the unexpected
that the ataxy had completely disappeared. He proposes at a future time to
t his further observations on this case; meantime, he recommends his col-
es, especially in recent cases, to put the treatment by nerve-stretching to
r test.—*London Med. Record*, March 15, 1880.

Cure of Neuralgia by Nerve-Stretching.

the *St. Petersburger Med. Wochenschrift*, December 20, 1879, Dr. E.
NG reports a case of supra-orbital neuralgia of over three years' standing,
had obstinately persisted notwithstanding various plans of treatment. Al-
h there was tenderness at the point of emergence of the supra-orbital, the
intense neuralgia was in the track of the naso-ciliaris, the infratrochlear, and
hmoidal nerves. These nerves being out of reach, he determined to attempt
on them by a thorough stretching of the supra-orbital. This he effected
free opening of the orbital cellular tissue, exposing the nerve in its entire
along the roof of the orbit. Near the orbital fissure he surrounded it with
t hook and so stretched it (inwardly) that its adhesions to the bony roof
broken up. Ten days after the operation the upper eyelid was freely mov-
There was complete anæsthesia of the forehead on that side as well as of
rnea. The neuralgic pains gradually lessened in severity, but did not en-
tease for several months. The anæsthesia continued for nearly six months.
don Med. Record, March 15, 1880.

Two Cases of Nerve-stretching.

the *Berliner Klin. Wochenschrift*, No. 46, 1879, Dr. SCHÜSSLER, of
en, describes a successful application of nerve-stretching to a case of mimic
of the left side of the face in a lady of thirty-nine. All other treatment
g proved unavailing, and the severity of the twitchings being such that the
nt's health was suffering from the disturbance of her nightly rest, he exposed
trunk of the facial nerve, with antiseptic precautions, separated it from its
h, and with a hook forcibly pulled it outwards. After one or two attempts
twitchings, which at first were excited by touching the nerve, ceased in all
s supplied by it except the angles of the mouth and neck. By stretching the
ch supplying these parts separately the twitchings were entirely checked.
ould be stated that the trunk of the nerve was in a congested state. The
ation took place on January 23, 1879; on April 12 the paralysis of the left
al muscles caused by the nerve-stretching had disappeared, there were no

twitchings, and the patient could feel perfectly everywhere except in the lobe of the left ear. She was well in every respect except that at intervals of ten to fourteen days she felt pain in the left brow and upper part of the left cheek, which was worse at the monthly period. She had experienced similar pain, but much more frequently, before the operation. On June 6, 1879, she reported that her health "left nothing to be desired." The twitchings, we should add, were first noticed in the summer of 1871. The second case is published in No. 48 of the same journal, 1879. A man of forty was admitted into the Berlin Lazarus Hospital under Dr. Carl Langenbuch on August 11, 1879, with symptoms of marked locomotor ataxy, with very severe "electric pains" in all the limbs, which could not be relieved by any sedative. The left sciatic nerve seemed the seat of the most intense pain, so Dr. Langenbuch began with that on September 13, operating antiseptically. The nerve-trunk was found on exposure to be injected and somewhat swollen. The stretching entirely removed the pain in that region, and the motor and sensory paralysis which resulted disappeared in a few days. On September 25, the right sciatic and both crural nerves were stretched at a single sitting. The patient was thus not only freed from the pains in his legs, but *the symptoms of ataxy also ceased.* He was able after a short time to walk without assistance, with perfect control over the movements of his legs, and freedom from all disturbance of their sensibility. The arms, which were never affected to nearly the same extent as the lower extremities, and which had undergone no treatment, were still ataxic and painful at the time when Dr. Langenbuch wrote. The further progress of this case will be of great interest. It seems to be one in which the disease involves the peripheral nerves alone. Both in the case here given and in Dr. Schüssler's patient it may be said that it is only since the introduction of the antiseptic method that the operations described could have been attempted without great risk of dangerous after-affects.—*Med. Times and Gaz.*, Jan. 10, 1880.

Antiseptic Treatment of Head Injuries.

Since 1860, Prof. J. A. ESTLANDER (*Nordiskt Medicinskt Arkiv*, vol. xi. No. 3) has treated 341 cases of injuries to the head, not including those of the face. Previous to 1870 the old methods were followed; since that time Lister's antiseptic treatment has been in use. To render the results of these two epochs more evident, he has divided his cases into three groups: 1. Simple wounds of the integument. 2. Similar wounds with denudation of the cranium. 3. Such as were complicated with fracture of the cranium and lesions of the encephalon. He has omitted the cases where other affections caused sudden death and no treatment of the wounds could exert any influence. From this comparison it would appear that previous to 1870 simple wounds afforded less favourable results than those treated by the antiseptic method, but the difference is not very great. The wounds with denudation of the cranium, on the contrary, gave much more favourable results by Lister's method. By the latter the mortality fell to 1.5 per cent., whereas by the old methods it was 24 per cent. The author considers that this complication should no longer be viewed in the serious light which prevailed previous to the adoption of the new method. The difference is still greater in the third category, for, before 1870, he lost three-fourths of the cases which presented lesions of the bones of the cranium and of the brain, while by the antiseptic treatment he has saved five-sixths of them. This is still more remarkable, as the fractures of the base, where the antiseptic treatment cannot be placed in question, have furnished the same results during the two periods. It is true that the diagnosis of this lesion may have been occasionally doubtful, where death did not

esult, but the diagnosis has always been based on the same signs, and the errors
t is fair to suppose have been equal. Several cases are related in detail to illus-
te this method of treatment.—*Med. Record*, March 27, 1880.

—

Disturbances of Vision caused by Injuries to the Skull.

Dr. **Berlin** has collected a number of cases which have come under the ob-
vation of himself and others, in which amaurosis has followed severe blows
the head. In an interesting paper, read before the Ophthalmological Society
Heidelberg, he has given his views on this subject. These may briefly be
med up as follows: The amaurosis is in by far the greatest number of cases
ateral; it arises suddenly at the time of, or immediately after the injury,
is generally complete and incurable. The injuries giving rise to the amau-
s are almost always severe, such, indeed, as generally give rise to loss of
sciousness at the time, and may often be supposed to have caused fracture.
frequency of fracture of the roof of the orbit is very great, as may be seen
the statistics of Hölder. Of 126 cases of fracture of the base of the skull
mined by him, 88 involved the base, in 80, or 90 per cent., of which the
f of the skull was fractured. In 54, or 60 per cent., the line of fracture
ed through the walls of the foramen opticum, and this independent of the
tion of the force producing the fracture. In the 54 fractures of the optic
en Hölder found extravasation of blood into the sheath of the optic nerve
mes. No extravasation into the sheath of the nerve was found in any case
the fracture did not involve the foramen. Taking into consideration, then,
severe nature of the injuries causing amaurosis, and the statistics of Hölder,
in is of opinion that the amaurosis in such cases is generally the result of
y to the optic nerve from fracture through the foramen.—*Edinburgh Med.*
nal, March, 1880.

—

Experiments on Blindness produced by Pressure.

great many experiments have been adduced lately by Boll, Kühn, Ewald,
others, in support of the theory that retinal excitation is of a photochemical
re. In the last number of *Pflüger's Archives*, p. 614, Professor **Exner** de-
es some phenomena which he considers can only be explained by supposing
there exists in the retina a supply of a sensitive substance acted on by light,
h is constantly being replaced from the blood as it is used. The following
e more important of Exner's experiments: 1. If the field of vision be
ed into a white and black half, and a point fixed on the line of intersection,
t at the same time pressure be applied to the eye until the white half be-
es almost completely dark, it is found that if a white substance be then pre-
ed to the black half of the field it appears of normal intensity, gradually
g its brightness as the fixation is prolonged. 2. If an object be fixed for
e time, it will, as is well known, give rise to an after-image, the duration of
ch depends partly on the brightness of the object and partly on other circum-
nces which are well known. If, however, the object be fixed whilst the eye
subjected to pressure, the duration of the after-image is greatly diminished,
d, if sufficient pressure has been employed, ceases to appear at all. It must
remembered that such experiments are not absolutely free from danger. Care
st especially be taken not to release the pressure too suddenly.—*Edinburgh*
d. Journal, Feb. 1880.

Observations concerning the Value of the Audiphone.

Dr. H. **Knapp**, of New York (*Archives of Otology*, March, 1880), has recently making comparative tests of the value of the audiphone and of dipper-shaped ear trumpet as aids to hearing. The results of his clinical are that the audiphone (Rhodes's) produced no increase of the acutene hearing in 20 per cent. of the cases, a slight increase (from 1.2 to 1.5 time 20 per cent., a moderate increase (from 2 to 5 times) in 60 per cent., wh the *dipper-shaped ear trumpet* produced an increase of the acuteness of he in all cases, slight in 8 per cent., moderate (from 2 to 5 times) in 35 per c and great (from 6 to 20 times) in 58 per cent. The audiphone, therefore, i a *useless* instrument. It increases, in a moderate degree, the hearing pow the majority of very deaf persons; in every case, however, as far as Dr Kn examinations have gone, was its value exceeded, and in most cases greatly ceeded, by the ear trumpet.

In addition to the tabulated cases from which these conclusions were obta Dr. Knapp has tested others with the same result, and his conclusions a accord with those of other qualified observers.

Treatment of Strictures of the Œsophagus.

In the course of a recent discussion in the Vienna Medical Society (*A meine Wiener Med. Zeitung*, No. 42, 1879) Dr. **Weinlechner**, who o the discussion, said he would confine his remarks to the cases requiring œs geal or gastric fistulæ. One indication for such an operation would of cou the presence of a foreign body so situated that it could be neither extracted above nor driven downward to the stomach. Besides, there were cases in scarcely a drop of fluid nutriment could be taken, and finally, there mi a diverticulum of the œsophagus.

He had twice performed œsophagotomy for very tight strictures of that In 1868 he operated upon a woman, aged 34, who had complained of di deglutition for seven months, had been able to swallow only fluids for months, and not even these for three days prior to her admission to the ho The patient was much emaciated, was feverish, and coughed incessantly large mass was felt at the lower extremity of the pharynx, completely closi orifice of the œsophagus. A small sound could not be forced past it. The ration was performed, and she was fed with concentrated fluid nutriment thr a catheter in the fistula made in the neck, but died on the fourteenth d pneumonia of the right lung. Examination showed beside this a tuber infiltration of the lungs, and at the upper extremity of the œsophagus a epithelial carcinoma, which involved also the posterior half of the larynx. he to again encounter such a case, he would (following Czerny) attemp removal of the neoplastic growth, even should it involve the resection of a tion of the œsophagus.

Dr. Weinlechner's second case was one of impermeable stricture produce swallowing concentrated lye. The child had swallowed absolutely nothin five days; the constriction was in the vicinity of the manubrium sterni. Œso gotomy was here performed, in the hope of more easily introducing the so and it appeared at first to be successful, as the bougie passed through the fi and beyond with apparently no obstruction. But, as milk was injected thr it, the child became instantaneously livid, gasped for breath, and died in tw hours. *Post-mortem* examination revealed right-sided purulent pneumonia, proved that the milk had been forced into the loose connective tissue of mediastinum.

After such experience, the speaker felt more inclined to resort to gastrostomy, ticularly as it appears to be more properly indicated in cases of cicatricial or malignant stricture not situated in the neck, and in case of foreign bodies usual size or shape. He referred to the statistics of this operation in carci- of the stomach, and stated that Schönlorn's patient had lived for three ths after the operation.

r. Weinlechner had performed gastrostomy twice. The first patient was a eleven years of age, who died of peritonitis in fifty hours. The next was a aged 17, who had two years before swallowed caustic potash and had re- red. When admitted he had been unable to swallow for six days. Intro- tion of a bougie was impossible. Death followed the operation in thirty s. In both cases artificial nourishment by clysters proved of no service ever. Although he had himself been so unfortunate, Verneuil's statistics extraordinarily favourable.

rofessor BILLROTH stated as his opinion that, in the majority of cases of re the result of carcinomata, the introduction of bougies only irritated the ths, accelerated ulceration, and caused more rapid death. When unable to the stricture with an elastic bougie, he obtained another (elastic and hollow) filled it with quicksilver, the weight of which sometimes caused it to find its through. He had sometimes employed bougies of tin, but their use was ely hazardous. Such patients died either from starvation, marasmus, or tion of the œsophagus or stomach. He had twice performed œsophago- cancerous strictures, and then from the opening in the neck had pushed e neoplasm; but both the patients died very soon, and he had given plan. Computing that the infiltration of the lymphatic glands occurs te in œsophageal cancer, he began to think seriously of the radical re- of these neoplasms. He made his first experiments upon large dogs, cut- t a portion of the œsophagus, and feeding them for a considerable period h tubes. The animals were very tractable, soon learning to come of their e will to be fed in this manner. On examining these after killing, he that the borders of the œsophageal mucous membrane so closely approxi- , that although an inch and a quarter had been cut out, only a slight cicatrix remained. Such experiments were very encouraging. Profes- erny had done the first operation of this character in the case of a woman. moved the growth, together with a portion of the œsophagus, but did not the fistula to heal because he feared a return. The woman lived at least , but her subsequent history was unknown. Partial resection of the œso- was also possible, and he considered it advisable to make such attempts, close the fistulæ, and introduce food by the mouth. This has proven ful in dogs. He had performed œsophagotomy for the extraction of bodies three times in children and once in an adult. The result was ly successful.

hough gastrostomy had been highly extolled during the past few years, lly in cancer of the cardiac orifice, Dr. Billroth could not recommend it, procedure had thus far given the patients only a very brief respite. He ed the same statement would apply with equal force to the formation of al anus in cancer of the rectum. He did not think much had been gained single case in which he had so operated. The patient's nutrition was ved, he lived an entire year, but his pain was not at all alleviated. Finally, Billroth narrated two unfortunate cases in which, on introducing the sound h the œsophagus, a perforation of the stomach had resulted, causing diffuse nitis and death within twenty or thirty hours. He relied very little in any hese cases upon artificial nourishment by enemata.

Professor **WEINLECHNER** referred to several cases in which death came
with the symptoms of perforation of the œsophagus, in which *post-mortem* exa
nation failed to discover any wound. In all these, however, pleuritis was p
sent. Professor Billroth stated that in distension for the passage of fluids
cicatrix might be torn, and thus a periœsophagitis, mediastinitis, and ple
might rapidly follow.

Dr. **TELEKY** mentioned two cases of œsophageal stricture, the introductio
sounds through which proved unsuccessful. In one he perforated after he
repeatedly passed it with great ease. Section proved that death of the tis
had taken place about the stricture, thus rendering perforation almost unav
able. In the second case, fatal hæmoptysis followed, but no perforation
made. The discussion concluded with the report by Billroth of one, and
Weinlechner of several cases of œsophageal stricture caused by syphilitic ul
tion.—*London Med. Record*, March 15, 1880.

Diagnosis of Carcinoma of the Mammary Gland.

In an instructive clinical lecture on the life and diagnosis of mammary c
noma, based upon a study of one hundred cases, Dr. **SAMUEL W. GROSS**,
geon to the Philadelphia Hospital, makes the following remarks (*Boston*
and Surg. Journal, March 25, 1880) on diagnosis and treatment:—

The points in favour of carcinoma are, non-development before the a
twenty, greatest frequency after the fortieth year, irregular shape, almost
formly densely hard and knobby feel, immobility in the gland, attachme
the skin and deeper structures, solitary origin, comparatively small v
and slow growth, retraction of the nipple, infiltration of the lymphatic g
invasion of the skin by small nodules, non-enlargement of the subcut
veins, limited ulceration, without any tendency to fungous protrusion, an
thickened, indurated, and everted edges of the ulcer.

The diagnosis of the non-carcinomatous tumours is based, on the other
upon their occurrence in every sixth case before the age of twenty, their gr
frequency before the fortieth year, their multiplicity in one breast, their
pheral situation, their rounded or ovoid and bossed outline, the firm consi
of the smaller and the unequal feel of the larger, their mobility in or on the
and the adjacent tissues, their comparatively rapid growth and bulky si
natural appearance of the skin, the enlargement of the subcutaneous veins
they are voluminous, their tendency to ulcerate and protrude late in the di
and the absence of adhesions between the fungus and margin of the ulce
their freedom from retraction of the nipple, nodules in the skin, and taint
associated lymphatic glands.

Among the more prominent signs of carcinoma are those which indicate
infection of the surrounding tissues, and a knowledge of the date of their ap
ance will prove serviceable in deciding the question of an operation. No
may be looked for in the skin in fourteen months, the contaminated lymp
glands of the axilla may be detected in fifteen months, ulceration may be
pected in seventeen months, and deep adhesions take place in twenty-one mo
These figures denote the average dates; but I have known infiltration of the
pectoral muscle, and glands, and ulceration, to occur as early as four months,
to be postponed, on the other hand, for several years. Glandular involvem
indeed, may show itself as early as the first month, or even before the pri
tumour can be felt; and from the fact that the glands are buried in the fat of
axilla, thereby evading early detection, I believe that their invasion anted
that of the skin. Be this as it may, if you are about to operate on a cas

hich there is nodular infiltration of the skin, you should be prepared to open e axilla and search for infected glands, even if they cannot be distinguished om without.

Finally, I desire to state that I am no believer in the constitutional origin of rcinoma, and that I am convinced that we will obtain good results after operr- n if we can only secure cases in which the disease is limited to the gland itself. ven when the skin over the breast is infiltrated to a slight degree, and the lym- atic glands of the axilla are not too seriously involved, I believe that we may olong life, if not obtain a radical cure, by extirpation. To do this, however, must discard the operation as you usually see it performed, and remove the ire gland, with all its coverings, by a circular incision, dissect away the pec- al fascia, and clean out the axilla. In other words, do not aim to secure a ering for the wound, but practise thorough excision.

On the Treatment of Cancer of the Female Generative Organs by a New Method.

In a communication to the *Lancet* (March 27, 1880), Prof. JOHN CLAY, Ob- ric Surgeon to the Queen's Hospital, Birmingham, strongly recommends n turpentine in the treatment of cancer of the female generative organs, and cancer of other organs; and from the results which he has obtained, he , it may be confidently stated that the remedy exerts a powerful action on er of the female generative organs in particular, and it will be of advantage int out some of the conclusions at which he has arrived respecting the effi- of the drug and the manner in which it should be employed. The oil of ntine, if it produces any effect on cancer, is inadmissible on account of the dy production of its specific effects even when administered in small doses. same remark applies with less force to the Venice and Strasbourg turpen- s; in his hands they have not produced the same beneficial effects on cancer- growths as the Chian turpentine has done. The maximum dose of the last- ed drug which can be safely and continuously given is twenty-five grains y. It is advisable to discontinue the remedy for a few days after ten or ve weeks' constant administration, and then to resume it as before. The bination with sulphur was given at first, and has been continued. It is doubt- whether much benefit is derived from the combination, but the effects have so uniformly good with it, that it was thought advisable to continue its use. e is every reason to believe, from the trials made with other substances in bination with the turpentine, such as carbonate of lime, iodide of calcium, oniated copper, quinine, bebeerine, hydrastin, etc., that the turpentine is administered simply, as the most marked and rapid effects have always been ifested when it has been given alone.

The turpentine appears to act upon the periphery of the growth with great r, causing the speedy disappearance of what is usually termed the cancerous ltration, and thereby arresting the further development of the tumour. It oduces equally efficient results on the whole mass, seemingly destroying its lity, but more slowly. It appears to dissolve all the cancer cells, leaving the els to become subsequently atrophied, and the firmer structures to gradually n a comparatively normal condition.

It is a most efficient anodyne, causing an entire cessation of pain in a few days, d far more effectually than any sedative that Dr. Clay has ever given. In the es he describes no sedative was employed in any instance, although in some es where great pain had existed previously to commencing the treatment, large oses had been given. Whether this arrest of pain arises from the death of the

tumour, or is due to there being no longer irritation of the sentient nerves (
consequence of tension being withdrawn by the removal of the cells), the f
is the same.

If, after the use of the remedy for some weeks, one of these cases were ex
ined by a stranger for the first time, he would probably conclude that it was
of commencing malignant disease, by reason of the irregularities of its surf
The effect of the remedy being first to remove the cellular structures, any lo
tissue produced by the invasion of the disease cannot be restored, and hence
irregular touch and appearance even after cicatrization. The arrest of the h
orrhagic discharge and the remarkable freedom from glandular affections, aft
lengthened use of the turpentine, are specially important factors in materi
aiding the removal of the cachexia and of improving the general conditio
the patient.

Without being in a position to affirm that the Chian turpentine is a posit
cure for advanced cancer of the female generative organs, yet however the fa
here adduced may be interpreted in this respect, two circumstances are indisp
able—one, that all the patients after several months' treatment are living,
that the disease has not advanced as is usually the case, but has retrogressed—
fact, has all but disappeared; and it may at least be safely asserted that when
remedy is steadily used for some time it arrests the progress of the disease,
relieves the pain incidental to the morbid growth in a manner which canno
said of any other remedy. It is probable that on an extended experience o
use and by variations of the mode of administration, it may prove an effe
cure for this intractable disorder. Patience and perseverance on the pa
patient and medical adviser are absolutely required. We know that in some
eases, as bronchocele and syphilis, a long continuance of well-known remedi
often necessary to effect a cure of the particular disorder, and that the adm
tration of the remedies has to be varied from time to time, according to the
rapeutic effects produced by the drugs. In cancer, as far as experience ha
present indicated, the same alternating method may perhaps have to be emplo
Whatever may be the ultimate results, there can be no doubt that Chian turpen
in these disorders is a most valuable medicine. Judging by Dr. Clay's experien
it is no figurative expression to say that it acts as a direct poison upon the grow
probably causing its ultimate death. In advanced cancer the process of rep
tion is slow, but if the surrounding structures are not too much involved in
process of destruction, it will seem that a cure may be reasonably expected. I
not that the remedy has failed against the cancer, but that the vital organs ar
much destroyed that their complete reconstruction and adjustment of functi
are not possible, and life fails in consequence of their mutilated condition. E
under these circumstances, if the cancer does not recur, the efficacy of the me
cine is obvious. In the early stages of cancer it may be affirmed that an
doubted cure may take place speedily, and as the contiguous structures are
extensively involved, but little deformity ensues; and experience justifies
expectation that under such circumstances a recurrence of the disease will
follow.

The following is the formula which Mr. Clay uses: Solution of Chian turpe
tine, half an ounce; solution of tragacanth, four ounces; syrup, one ounc
flowers of sulphur, forty grains; water to sixteen ounces: one ounce three tim
daily.

The *Lancet* (April 3, 1880) calls attention to the importance of making s
that the drug employed is certainly what it professes to be. As a matter of fa
it is by no means easy to obtain Chian, or Cyprus turpentine. So long ago
the date of the publication of the earlier editions of Pereira's Materia Medi

ere was so much difficulty in procuring the substance that the profession was pecially warned against the almost inevitable substitution of Venice or Canada rpentine, or some other terebinth of totally different properties, in dispensing prescriptions, for Chian turpentine. Probably there is scarcely any of the true in in the market at present, and only druggists who happen to possess a small gotten store *can* supply it. We think it desirable to make this intimation for sake of medical practitioners who may be anxious to try the remedy, but who almost sure to be disappointed, unless they take more than ordinary measures ensure accuracy. As Professor Clay stated in his paper, no other terebinth cept the Chian has been known, or can be expected, to produce the effects ch have followed its use in his cases. The public should also be cautioned inst resorting to the remedy, without skilled medical advice and supervision; very earnestly must they be made to understand that probably not a tithe of medicine likely to be sold under the name of "Chian turpentine" during the t few months will be genuine. The caution given to the profession years ago he then highest authority on the subject of pharmacy, at a time when there no special demand for the drug, will be doubly necessary now, when nothing the accident of having a small reserve on hand can enable any druggist to dis- e it. It only remains to add that some of the received descriptions of *Tere- ina Chia* seu *Cypria* are so faulty that identification of the genuine drug will tended with more than ordinary difficulty. It is the gum of a tree growing or thirty-five feet in height, and is obtained by cutting crosswise with a t the trunks of the largest trees. The yield is very small, "not exceeding or ten ounces" for each tree; so that it must be obvious that the bulk of the rial sold under this designation at two or three shillings a pound is not ine. Its consistency is that of honey, but it is more glutinous. The colour enish-yellow. It has an agreeable turpentine-like odour, combined with the r of fennel or citron and jasmine. Its taste is very mild. By keeping it ifies, and, we may add, loses some of its virtue. The coniferous turpentines, h do not possess its special qualities, are usually sold for it.

—

On the Treatment of Gonorrhœa.

might be thought that all has been said that can be said on the treatment of rrhœa, but the experience of so distinguished a specialist as Prof. Zeissl, ienna, detailed in a communication to the *Wiener Med. Wochenschrift* (1879, 38, 39, and 40), cannot fail to prove of interest to our readers.

e object he has in view, he says, is to indicate some of the leading points in eatment of catarrhal disease of the male urethra; and he enters into details the subject, because both his hospital and private practice have too often him the sad opportunity of observing that both old and young practitioners not always careful enough in avoiding manipulations that are highly injurious e urethra, as, for example, the employment of concentrated solutions for ctions.

1. *The Direct Treatment of Acute Gonorrhœa.*—As every one knows, we can t gonorrhœa either by direct applications to the urethra, or indirectly through digestive organs. In the direct treatment, before all things, we must insist the patient wearing a suspensory, in order to prevent traction on the testes. should take no beer or champagne, or any drink which contains much car- e acid in the nascent state, as this gives rise to dysuria. Meat in the even- and late meals should be avoided, as favouring the occurrence of nocturnal utions, aggravating the patient's condition. The same may be said of the -bath taken late in the evening. During the acute stage, if there still exist

severe pain, especially after passing urine, and stabbing pains at the posterior part of the urethra—one of the earliest symptoms of gonorrhœa—we may confidently begin the treatment by the injection of a very weak solution of an astringent metallic salt. After the first effective injections the pains are considerably diminished, the urine is passed more easily, and the slight fever which is often present disappears. The relief of the pain may also be hastened by tepid sitz-baths. It is an interesting fact that the patient who at the beginning of the gonorrhœa can only pass urine amidst the severest pain is able to empty the bladder while in the bath with the greatest ease and comfort. With regard to the injections, they should at first be as weak as possible, so that they may never act as caustics, but only as astringents. The substance from which Prof. Zeissl has derived the best results is the permanganate of potash, of which he prescribes two centigrammes in 200 grammes of distilled water, thrown in four times daily by means of a caoutchouc syringe, care being taken to prevent the entrance of air, the presence of even a small quantity of which in the urethra suffices to induce severe dysuria. If this occur, or pains arise in the testes, the injections must be suspended, and the symptoms suitably treated. As already stated, it often happens that after a few injections the pain diminishes, and all traces of the gonorrhœa frequently disappear after only a week's employment of the permanganate. If, however, after using this very weak solution for a week no essential improvement has taken place, it may be strengthened by a centigramme; but Prof. Zeissl never goes beyond fifteen centigrammes in the 200 grammes of water. A rule to be observed is not to continue the same injection for too long a time, as the urethra becomes accustomed to the presence of the medical agent, the further employment of which is then useless. Therefore, if the permanganate does not cause the disappearance or diminution of the purulent discharge after it has been employed ten or twelve days, a weak solution (thirty centigrammes to 200 grammes) of sulphate of zinc should be substituted, gradually increasing the strength to five decigrammes. If this does not succeed, Prof. Zeissl then resorts to the employment of insoluble bodies, such as bismuth, kaolin, or the acetate of lead, prescribing five parts to 200 either of bismuth or kaolin, or two parts of sulphate of zinc and two parts of acetate of lead to 200 of distilled water. Injections containing these suspended bodies must be well shaken, so as to cause a uniform distribution of the precipitate in the urethra. This powder may remain in the urethra for a long period—and at all events until the next discharge of the urine; and when it is forced into the glandular orifices of the prostate it often remains there for a fortnight or longer. This circumstance explains the beneficial action of these suspended substances, as they remain in close and prolonged contact with the membranous and prostatic portions of the urethra and with the prostate itself—the parts in which the catarrh exhibits the greatest obstinacy. After the injection of these substances, a circumstance is often observed which may cause the patient unnecessary alarm. When the injections have been employed for fourteen days or so, he may perceive, when discharging hard fecal masses from the rectum, that little granular bodies, adhering to each other by means of filaments, issue from the urethra. They can be broken up by the fingers, and are nothing else than portions of the bismuth or kaolin which had remained in the prostatic canals cemented together by the secretions of the prostate.

If, in spite of the means employed, some remains of the gonorrhœa still exist; if the urethra is found stuck together in the morning; or if, on syringing it out with clean water, this is found, when examined in a glass tube, to contain mucous filaments or epithelium—it is then proper, besides using the injections, to introduce a gum-elastic bougie. For this purpose, Prof. Zeissl employs a conical elastic bougie of moderate size (from 10 to 14 of Charrière's scale), and having well oiled it and passed its end through a powder composed of starch, kaolin, or bismuth, passes it into the urethra at least as far as the sphincter vesicæ, and allows it to remain there for five or ten minutes. From this proce- ure he has obtained highly favourable results in gonorrhœa which may have sted for years. Nor has he ever met with any ill effect arising from it, or any nsecutive disease (as the formation of stone) resulting, numerous autopsies aving shown that the powder is not introduced into the bladder, but is all meared over the urethra. When by the use of all these means a cure is still t effected, we may then resort to solutions of alum, tannin, sulphate of cadmium, acetate of zinc, and to the introduction of lithotomy sounds until the largest hich the urethra admits of has been attained. This last procedure will be ain noted when treating on affections of the prostate consequent on gonorrhœa. e following are the formulæ which Prof. Zeissl recommends: ℞. Sulph. dmii 30 centigrammes, aquæ 200 grammes. ℞. Alum. 5 grammes, aquæ 250 . ℞. Sulph. cupri 5 centigr., aquæ 250 gr. ℞. Acet. plumbi basici soluti 5 mmes, aquæ 250 gr. ℞. Acet. zinci 1 gramme, aquæ 250 gr. ℞. Acet. zinci ramme, aquæ 250. ℞. Acet. zinci, tannini puri, āā 50 centigr., aquæ 200 . ℞. Acet. zinci 70 centigr., tinct. catechu 1 gramme, tinct. opii gtt. x, aquæ gr. ℞. Liq. ferri sesqui. soluti gtt. xx, aquæ 200 gr. Or urethral supposi- es may be formed of equal parts of kaolin and glycerine, and used four times y. When the subjects of gonorrhœa complain of very severe pains along the ineum, and especially on sitting down, either extract of belladonna supposi- es (℞. Ext. bellad. 7 centigr., butyri de cacao q. s., f. x. parva suppositoria) y be introduced into the rectum, or seven centigrammes of acetate of morphia y be added to any of the injections. Or again, urethral suppositories may be ed of seven centigrammes of muriate of morphia divided into ten. Prof. l attaches great importance to the not having too early recourse to the more erful action of the above substances especially the sulphate of copper. His perience has taught him that if at the beginning concentrated and caustic in- tions are employed, they may give rise to very violent reaction; and in one e he met with, the whole of the mucous membrane of the urethra was dis- rged like the finger of a glove, accompanied by great hemorrhage, in conse- ence of using a concentrated sulphate of copper injection. So, also, violent n and a great increase of the discharge were induced by an injection contain- five grammes of the hypermanganate of potash to 200 of water. These ex- ples, to which many others might be added, suffice to show that concentrated, therefore caustic, liquids act very mischievously on the urethra. Further, a fact that, by the use of these injections, the disposition which gonorrhœa eady possesses to induce stricture of the urethra is increased; and, indeed, stic injections will often suffice alone to give rise to this affection.

2. *Direct Treatment of Chronic Gonorrhœa.*—By the term chronic gonorrhœa, rof. Zeissl understands a disease of the urethra which is limited to a small por- on of the canal, most frequently quite its posterior part. There is only a spare romucous secretion, and rarely slight pain, especially seated at the diseased ortion of the urethral mucous membrane. Patients suffering in this manner ust be asked whether the stream of the urine has latterly considerably dimin- hed in size, for a similar chronic catarrh of the urethra will very frequently be roduced by stricture. A sound (from No. 15 to 18 of Charrière's series) should e passed in order to ascertain whether the calibre of the urethra is narrowed. For hose accustomed to the examination of the urethra, an elastic bougie will serve s well; but for those who have not had large practice in catheterism the sound is to be preferred, because with a solid instrument injury to the urethra is less

likely to be produced than with an elastic one; while entanglement of this last in a fold of the urethra may lead to a diagnosis of stricture being made where none such exists. Very often the patient is able, on the introduction of an instrument, to indicate exactly the diseased spot, by the pain occasioned there. We must not, however, trust too much to this indication, for the patient is often, on the first introduction of an instrument, in too anxious a state of mind to be able to afford any exact information. Patients constantly complain of a painful sensation when the instrument passes over the caput gallinaginis. During the withdrawal of the instrument, even those who have had but little practice with it can easily detect irregularities in the urethra when they are produced by granular growths, small polypi, etc., and sometimes are enabled to discover the diseased portion. Several methods have been devised for the direct application of medicinal substances to the small isolated diseased part of the urethra. Bougies or catheters on which such substances have been smeared, and syringes with catheter-like pipes, allowing the astringent fluid to be applied drop by drop at the posterior part of the urethra, are among these. The efforts which have been made to render the membrane of the urethra as visible as that of the vagina, and which have given rise to the invention of the endoscope, have not, in Prof Zeissl's opinion, been very successful. By its aid some interesting pathologico-anatomical facts have been established; but no material improvement in the treatment of prolonged gonorrhœa has attended the use of this instrument. Out of hundreds of cases in which he has employed the endoscope, Prof. Zeissl has only succeeded in effecting a cure in two instances by pencilling the diseased portion of the mucous membrane. He has therefore well-nigh given up this mode of treatment. He recommends that endoscopy should be practised upon the cadaver, and especially with the straight endoscope, which requires great dexterity for its introduction.

The same method of treatment must be continued in the chronic as in the acute form of gonorrhœa, and in the great majority of cases it will prove successful. Especial advantage will be gained by the well-timed introduction of the elastic bougie and sound, which will be referred to again.—*Med. Times and Gazette*, Feb. 14, 1880.

(*To be concluded.*)

Acute Osteomyelitis and its Causes.

Dr. Kocher (*Centralblatt für Chirurgie*, No 39, 1879) says that acute osteomyelitis is produced, like other inflammations, by infection, but still it is not a *specific* infectious disease. His observations were made on fifty-two cases, of which, however, only thirty were positively demonstrated to be cases of acute osteomyelitis. Of these thirty cases twenty-six were males and four females; all were between 8 and 25 years of age. In a few of the cases the patients had caught cold or had received an injury; in seven cases the osteomyelitis was secondary, having developed in one in the course of a typhus, and in the others during the existence of inflammatory processes in different parts of the body. Kocher believes that osteomyelitis is excited by the action of agents which may exist for some time in the body without giving rise to the general symptoms of infection of the bones. The bones which grow the most rapidly are the most frequently affected; hence certain spots, such as the lower end of the femur and the upper end of the tibia, present a special *anatomical predisposition*. In the experiments on animals several methods were employed. 1. Agents which exerted a physical or a chemical action (liquor ammoniæ, tincture of cantharides, croton oil) were tried with antiseptic precautions. 2. Decomposing fluids and pathological secretions were injected. 3. The first method was combined with he internal administration of putrid matters. The first method as a rule failed, while the third succeeded. True metastases in other organs were not observed. Hence it follows, that under some circumstances irritant matters may pass from he intestinal canal into the bony marrow, and give rise to osteomyelitis. In ute osteomyelitis disturbances of function of the adjacent joints often precede e other symptoms; purulent effusions into the joints may also occur early. If e abscess be opened, the epiphyses will often be found separated. The pus fre- ently contains free fat. The lymph-glands are only slightly implicated. The er is usually high from the beginning, without morning remissions, and some- es remains high for some days after the abscess has been opened. Recovery, en it occurs, is greatly protracted by the necrosis, which almost always occurs. th occurs either from multiple acute pyæmia, with metastases in the lungs, neys, and heart, or from the development of secondary inflammations in some ernal organs (pyelo-nephritis, pleurisy, etc.), after the original bone disease begun to improve. There is also danger of septicæmia after the abscesses e opened. Kocher divides the affection into three stages from a pathologico- tomical standpoint. 1. The stage of purulent infiltration of the medulla, the formation of isolated foci of disease; from these the pus extends to the osteum and synovial membrane. 2. The stage of formation of abscesses and estra in the cortical and spongy tissues, and in the epiphyses. 3. The stage epair. The osteomyelitis becomes chronic in the form of chronic osteitis, or scess of bone; the former terminates in osteosclerosis or in osteoporosis. In way of treatment Kocher recommends the salicylate of soda in doses of a hm and a half to 6 drachms daily, or if that is not borne, alcohol in larger tities. Locally, he advises the evacuation of the pus by puncture, and the ction of a 5 per cent. solution of carbolic acid, one or more hypodermic gefuls daily. The fluid should be injected not alone into the abscess, but by means of hollow drills into the medulla. If the abscess have already ken, free incisions should be made down to the periosteum, and strict antisep- dressing employed. If the joint be involved it can sometimes be saved by shing it out with a 5 per cent. solution of carbolic acid, but amputation will en be necessary.—*London Med. Record*, March 15, 1880.

Suppuration of Joints after Acute Rheumatism.

his sequela of rheumatic fever is admitted by all authorities to be very rare, some have even doubted its occurrence. Nevertheless, Dr. W. Korte, stant Surgeon to the Berlin Bethany Hospital (*Berl. Klin. Wochenscrift*, 4, 1880) reports six cases which came into the surgical clinic between August, 7, and June, 1879. Four of them were treated for the rheumatism in the ical wards and transferred, and the two others came directly under surgical tment from outside; but in every instance there was no possible doubt of the e nature of the primary disease. None of the cases were pyæmic. All were men of ages ranging from twenty-one to forty-eight years. Two were pre- usly strong, the rest of delicate constitution. Two had endocarditis. All had n treated with salicylic acid, but the usual effect was not produced by it, and disease seemed to linger obstinately in one of the affected joints after the ers had recovered. The suppuration was indicated by severe pain on move- nt and handling, by distension of the joint capsule, redness and swelling of the t parts, and fever, especially at night. In three patients the knee-joint was fected, and in three the ankle-joint. In two at least of the latter the inflamma- on was limited to the synovial membrane, and the cartilages were intact; these

were treated antiseptically with incisions on both sides of the joint, washing
with 3 to 5 per cent. carbolic solution and drainage. Recovery took place w
movable joints. The third ankle-joint required partial excision, and its mo
ment was consequently less perfect than in the other two. All three cases
suppuration in the knee-joint had advanced to injury of the ligaments, cartilag
and ends of the bones, and resection was necessary in all. Two of these patie
recovered extremely well; the third died of gangrenous bedsore. Dr. Kö
considers that the treatment adopted for the ankle-joint is the best possible, wl
the deeper parts of the joint are still intact, and the suppuration remains w
he terms "catarrhal." He suggests that the frequency of suppurative joi
affections after rheumatic fever in the cases before us may have depended on
character of the epidemic during which these cases occurred, just as some e
demics of typhoid fever, scarlet fever, etc., are specially followed by joint-infl
mations. Curiously enough, he does not refer to the salicylic treatment as h
ing any possible causal connection with their occurrence.—*Med. Times and G*
March 20, 1880.

Result of Excision of the Lower Ends of the Radius and Ulna for Myel Tumour.

At a late meeting of the Clinical Society of London (*Lancet*, Feb. 21, 1
Mr. HENRY MORRIS exhibited a woman from whom he had removed a my
tumour of the radius about four years ago. The case is recorded in vol.
the Transactions. The lower part of the radius and four inches of the ulna
removed. Dr. Gross, of Philadelphia, in a recent paper,[1] had collected
cases, which he regarded as unsuccessful, including this one, the details of w
however, he had only gathered from a journal report; for the patient's
was sufficiently useful to enable her to follow her household duties. She
sew, wash linen, using her index and middle fingers, and the case showe
excision should not be condemned too hastily as opposed to amputation.
Morris wished now that he had removed as much of the ulna as of the radiu
from retraction of the parts the end of the former projects over the carpus.

Midwifery and Gynæcology.

The Value of Disinfecting Intrauterine Injections.

Dr. HOFMEIR contributes a short paper on this subject to the *Centralblatt*
Gynäkologie (No. 5, 1880). He objects to needless employment of intraut
injections as likely to be dangerous, and supports his view by reference to
normal cases in which intrauterine disinfecting injections were used, and of w
42, or 16 per cent., were the subjects of inflammatory processes in conne
with the genital organs; whilst of 249 cases treated without injections only
or 8 per cent., were so affected. Of the 42 cases 8 were seriously affected,
of the 19 only 1. The author, however, holds that if, during the labour, fer
tation and putrescent processes have been started, as evidenced by the forma
of gases in the uterus and fever in the patient, disinfectant injections are not
not objectionable, but are urgently necessary, and give excellent results.
strength, however, must be considerable, so that the injection shall be sligh
caustic. Dr. Hofmeir recommends a solution of carbolic acid, 1 in 20 of wa
to be employed in such cases, and maintains that he has seen excellent res

from this. The author recommends the same treatment to be adopted after stinking abortions and such like conditions.—*Edinburgh Med. Journal*, April, 1880.

The Fungosities of the Umbilicus in Newly-born Children.

M. Ch. Féré has contributed to the Société Anatomique of Paris (*Progrès Méd.*, Dec. 20, 1879) a note on this subject. These growths are far from rare, ut yet, from certain points of view, have been little studied. They gene- lly show themselves during the four or five days following the fall of the cord, d rapidly develop. They present themselves under several forms. They are ten fine, almost perfectly cylindrical projections, only two or three milli- etres in thickness, but possibly attaining the length of a centimetre or more; ey then project beyond the level of the abdominal wall, but they are only well en on unfolding the umbilical depression. This cylindrical appearance has led the view that they may be formed by a vessel, either a vein or an artery, hich has not been divided at the same level as the rest of the cord. Yet more en these tumours look like pimples, sometimes peduncu- ed, more or less regularly rounded, rosy, of a fungous appearance, rarely eding; if they are small they are only noticed if one is warned of their pre- ce by prolonged suppuration, and unfolds the umbilicus; sometimes they h a considerable size, and it has even been possible to compare them to small rries (Simpson); most commonly they are about the size of a small pea. ey seem not to have any tendency to spontaneous cure. Astley Cooper has erved one which he attributed to the remains of the cord in a child seven rs old; although it bled, and was sometimes painful after irritation, it might, says, be at first mistaken for an umbilical hernia. The cylindrical vegetations be destroyed by cutting them off, or by ligature; the operation does not voke hemorrhage, and the tumour is not reproduced. The sessile tumours e easily repressed by cauterizations with nitrate of silver; it is not prudent to stroy them by more energetic measures without the most minute precautions; one case, after destruction by caustic, fluid ran out, there existed under the ngous cicatrix an entero-umbilical diverticulum which had been opened. The stological structure of these tumours is little known. Kustner has distinguished ree varieties: 1, the granuloma of Virchow, which is the most common form; the vascular fungus (myxosarcoma telangiectasique de Virchow), more rare; d, 3, adenoma. This author has also found in some of these tumours smooth scular fibre, and all the elements of intestinal mucous membrane. M. Féré examined two specimens. One was of the cylindrical kind, and was cut off h scissors eleven days after birth. Its tissue had all the histological characters a round-celled sarcoma. It was covered by a layer of epidermis. The other s of a cylindro-conical form, and of the size of a grain of wheat. It was cut by a ligature put round its base. Histologically it was composed of a sarco- atous tissue more advanced than the preceding one, in parts the tissue was even brous; the vessels were smaller than in the first case, a fine layer of epidermis overed its surface. It was histologically a sarcoma with a tendency to the rmation of fibrous tissue. It may, therefore, be considered as an example of a oplastic process which, while presenting all the histological characters of sarco- atous tissue, yet has none of the clinical characters ordinarily associated with ch growths.—*Obstetrical Journal of Great Britain*, March 15, 1880.

Prolapsus Uteri: Elytrorrhaphy after the Method of Lefort.

At a late meeting of the Société de Chirurgie de Paris, M. Parras stated (*Le Progrès Méd.*, Dec. 13, 1879), that this operation had now been performed three times, by Lefort, Rancarol, and Panas respectively. The case he brough before the Society was that of a woman, aged thirty-six, who had suffered fr complete prolapsus for seven years, since the birth of her last child; her pe neum had also been lacerated. She died from another disease more than tw years after the operation, and during this time the cure was complete. The op ration consists in uniting in the mesial line the anterior and posterior vagi walls, so as to make two lateral vaginæ. The surfaces freshened were about centimetres in length, by two in breadth, and the raw surfaces were kept in co tact by twelve sutures, one above, five on each side, and one below. M. Pa thinks this operation better and easier than that of Sims. It is easy to de the surfaces and to pass the sutures, because the parts, being prolapsed, are or outside, the vulva. The anterior sutures are the last inserted. It is true at the end of the long and narrow lateral vaginæ formed by the operation th is great difficulty in withdrawing the sutures. To meet this objection, M. Pa proposes to use catgut stitches, which, as they will be absorbed, the surg need not trouble himself to remove. Although the parts vivified are very cl to the peritoneum, yet no evil result has followed in either of the three ca The only inconvenience is the obliteration of the vagina, an inconvenience which it is the bounden duty of the surgeon to previously inform the patient.— *Obstetrical Journal of Great Britain*, Feb. 1880.

Fibroid Tumours of the Uterus, and their Treatment by Continuous Curre

This paper by **Cheron** (*Gaz. des Hôpitaux*, 1879, p. 226) is the resul twelve years' observation of forty-two cases of uterine fibroids. The galv current applied continuously, one pole to the uterus, the other externally, no results even after one hundred or more applications. The induced cu was found difficult to bear when applied with sufficient strength. The a then resorted to the interrupted galvanic current, placing one pole (posi on the cervix, the other on the abdomen, and interrupting the current e second. [No clear directions as to the length and strength of the applications given.] The results were most favourable, and were probably due to the sti lating and catalytic influences of the current. Several cases are described, in wh the hemorrhage disappeared, the tumour diminished in size, and the gen health improved. The author does not, however, allege that he obliterated tumour entirely.—*London Med. Record*, March 15, 1880.

—

The Complete Extirpation of the Cancerous Uterus by Freund's Method.

Solovieff, of Moscow, reports (*Archives de Tocologie*, Jan. 1880) the c of a patient aged forty-three, who had had four children. She had been suf ing from pain, with hemorrhage and fetid discharge for eight months. To va nal examination the cervix uteri seemed healthy, except that it was somew thickened; but after the os externum had been enlarged by incision, it was fou that the interior of the neck and body of the uterus was covered with dense p jecting excrescences. The operation was performed with the strictest antisep precautions. Its details are fully described, but cannot well be abbreviate The patient died twenty-six hours afterwards. Death appeared to have tak place from shock, combined with septicæmia. The author considers that it very difficult to draw a parallel between the extirpation of the cancerous uter and ovariotomy; first, because when the cancerous patients come under notice th disease has generally already made considerable progress, and the general heal has seriously suffered. Added to this, there is the section of the peritoneu in two places, and the greater length of the incision required. But the great advantage of Freund's operation consists in the fact that the intestines have to drawn out of the abdominal cavity, and retained there by the pressure of a th; whereas in ovariotomy, on the contrary, the intestines generally remain ithin the abdomen. This is the explanation of the frequency of death from ock after Freund's operation. The following are the chief points in which the thor thinks that the operation needs improvement: 1. It is necessary to find mode of operating without drawing the intestines out of the abdomen. 2. The ration needs to be made as short as possible, that the intestines may not be lled, and that the patient may not be longer under chloroform than can be ped. The author goes on to mention nine other points, all of which refer to rative details. He gives a table of all the cases which he knows of, in which operation has been performed up to the present time. There are 47 cases, which 12 recovered and 35 died. He thinks that these figures are enough to vince any sceptic of the legitimacy of the operation, and that the operation in the future take a foremost place in surgery.—*Obstetrical Journal of Great itain*, Feb. 1880.

Successful Removal of the Uterus and one Ovary for the Relief of a Subperitoneal Uterine Tumour.

. W. THORNLEY STOKER recently brought before the Surgical Society of d (*Med. Press and Circular*, Jan. 28, 1880) a case of this. The tumour een first noticed two years and a half before the operation. It was freely ble, lay chiefly to the left side of the abdomen, and was so elastic as to a doubtful sensation of fluctuation both to the finger and when percussed. when the division of the abdominal wall had been completed and the e of the growth laid bare, it was impossible, until an attempt had been to push a trocar into it, to say whether it was solid or fluid. The uterine y was of normal size. Every part of the uterus that could be felt by the r in the rectum was of natural size and character. The vagina was not ted, and nothing abnormal could be detected by digital examination either ectum or per vaginam. These features made it very difficult to determine her the tumour was uterine or ovarian. The tumour increased rapidly the patient was under observation, ascites made its appearance, and the al health visibly declined. It was, therefore, thought proper to remove rowth. The operation was performed under thymol spray; but the anti- precautions were not completely carried out, and the wound did not n aseptic. The operation was a very long and difficult one. The incision ary extended from near the ensiform cartilage to the neighbourhood of the . There were extensive adhesions on every side, the omentum giving ial trouble. The pedicle was formed of the cervix uteri; stout plaited silk passed twice round it and tied tightly; but this was found insufficient to nt the risk of hemorrhage, and the pedicle was therefore transfixed with a g pin, and another ligature put round it at the point of transfixion, and its twisted round the pin. The right ovary was removed with the tumour; left did not present itself. A glass drainage-tube, four inches long, was ed in the lower angle of the wound so as to reach into the pelvis. Much d was lost during the operation, and at its conclusion the patient was at the t of death from exhaustion. The pin with the slough of the pedicle separated e eleventh day. The patient's recovery was interrupted by many untoward ptoms; excessive vomiting during the first eight days; aphthous ulceration he mouth and fauces from the third to the eighth days; fetid vaginal discharge from the sixth day to about the fifteenth ; much pain and sleeplessne After the twentieth convalescence went on rapidly. The tumour weighed 1 pounds, and was a large myoma, occupying the upper and anterior wall of th uterus. Dr. Stoker considers that the case affords very substantial testimony t the value of the drainage-tube, without which he thinks the patient would hav died.—*Obstetrical Journal of Great Britain*, March 15, 1880.

—

On Axial Rotation of Ovarian Tumours, leading to their Strangulation and Gangrene, successfully treated by Immediate Ovariotomy.

At a late meeting of the Obstetrical Society of London (*Lancet*, March 2 1880) Mr. LAWSON TAIT read a paper on this subject, and reported three ca successfully treated by immediate ovariotomy. The first case of the kind whi the author had met with was that of a woman aged forty-eight, on whom he h operated for a femoral hernia, supposed to have been strangulated for two day The patient died in five days. The autopsy revealed a small ovarian tumour n recognized during life. It was black and gangrenous from twisting of the pedicl

Of the three cases now recorded, the first was that of a woman forty-six yea old. In March last the author diagnosed a small monocystic tumour, probab parovarian. On June 9th she returned with the tumour much enlarged, a suffering from intense abdominal pain. Immediate ovariotomy being perform the author found the cyst of a black-pearly colour, universally adherent by rec lymph. The pedicle was twisted three or four times. The patient made an interrupted recovery, though no Listerian precautions were used.

The second case was that of a woman aged thirty, who had noticed gradual crease of size for nine months. Sudden and violent pain in the abdomen occu on Nov. 6th, followed by incessant sickness. Ovariotomy was performe Nov. 17th, with Listerian precautions. The tumour was dark-purple, fri and universally adherent by recent adhesions. Bleeding was controlled by application of solid perchloride of iron. The pedicle was twisted twice. patient survived, but made anything but an antiseptic recovery.

The third case was that of a woman aged thirty-six, who had not menstru for seventeen weeks, but had noticed an increase of size too rapid for ordi pregnancy. Intense abdominal pain, followed by sickness, came on on Nov. 1 Immediate ovariotomy was performed. The uterus was found occupied b pregnancy of about the fourth month. The tumour was a parovarian cyst of right side, and was of a pearly-black lustre, and the pedicle was twisted th times. Listerian precautions were used, and the patient made a better recov than the second case, but not so good as the first. No symptoms of miscarr appeared.

In all these three cases the tumour was one of the right side, and the ped was twisted from within outwards and to the right side. From this circumst the author deduced a theory as to the causation of the rotation—namely, th is due to the alternate filling and emptying of the rectum. The feces desce ing the rectum would act as a wedge, and the point of application of the fe would be the most favourable possible in the case of a right-sided tumour.

Mr. KNOWSLEY THORNTON related several cases in which, on performi ovariotomy, he had found the tumour gangrenous from twisting of the pedic He agreed with the author that immediate ovariotomy should be performed wh symptoms arise leading to a suspicion of such a condition. In some cases, ho ever, the necrosed tumour, being excluded from septic influence, remained q escent for a considerable time.

Mr. **Spencer Wells** thought that it was easy to account for the rotation of the tumour by the patients' changes of position. Moderate degrees of twisting were often found without any gangrene being produced. He had seen two patients who died suddenly from very profuse bleeding within the cyst, without its rupture, the pedicles being found twisted. Last year he had removed by ovariotomy a cyst necrosed from twisting of the pedicle, which had been supposed to be malignant on account of the pallor of the patient. She recovered perfectly.

Dr. **Bantock** had recently met with two cases in which small tumours were und with twisted pedicles. Both tumours were found adherent, and both tients had been attacked by sudden pain, followed by symptoms of peritonitis. thought that the twisting produced no symptoms, but that the rupture of a odvessel was indicated by an attack of pain.

Mr. **Lawson Tait**, in reply, said that he hoped that Mr. Thornton and Mr. ells would publish their cases, with specific details. The rotation could not be idental, as held by Mr. Wells, if the great majority of the tumours twisted re right-sided tumours, and the twist in a specific direction.

A Case of Ovariotomy performed during the Sixth Month of Pregnancy without Interruption to Gestation.

. **Alfred L. Galabin**, Assistant Obstetric Physician and Joint Lecturer bstetrics to Guy's Hospital, reports (*British Med. Journal*, March 13, 1880) llowing case:—

s. L., aged 29, first consulted me on June 14, 1879, on account of rapid gement of her abdomen during the last two months. She was then under are of Mr. Powles, of Shepherdess Walk. She had had two children, and iscarriages. After each delivery she thought that a lump had remained on ft side of the abdomen; but this had not been observed by her medical dant. The last child was born in September, 1878, and died in January, , having been suckled until its death. The distension of the abdomen was much greater than at the full term of the previous pregnancies; and she was rtain whether she was pregnant or not, having felt no fœtal movements, and g had no sickness nor other subjective signs of pregnancy. Menstruation not recurred since the last delivery. After her first delivery she had suckled hild for eleven months; and the second child had been born when the first fteen months old.

examination, it was found that the abdomen was enormously distended, s surface, from the umbilicus downwards, was extremely œdematous, so that perficial tissues were increased in thickness to at least three inches. An rm and distinct fluid thrill could be felt over the whole surface of the abdo- . On vaginal examination, the cervix was found to be closed, but appeared softened, as in pregnancy. The resistance of the anterior vaginal wall mbled that produced by the presence of the pregnant uterus. The condition e breasts also appeared to indicate pregnancy. No fœtal movements were either from the abdomen or by vagina, and no fœtal heart-sounds nor uterine le could be heard. On bimanual examination it was found absolutely im- ible to define the size of the uterus or to ascertain the level of the fundus by impulse communicated to the cervix. The urine was free from albumen, the were not œdematous, the temperature was normal, and the general health ty good.

considered the probable diagnosis to be that of an ovarian cyst combined pregnancy; and, from the fact that no fœtal heart sounds nor fœtal move- nts could be made out, I thought that the pregnancy could not exceed four or e months in duration, conception having probably occurred soon after the death of the last child, and within five months after its birth. Since, however, the great œdema prevented the uterus from being defined bimanually, I considered the differential diagnosis from hydrops amnii not quite certain. The œdema of the abdominal wall made it evident that some interference would soon be necessary. I thought that, if the case should turn out to be hydrops amnii, the puncture of the uterine wall in tapping would not be without risk, although the operation has been performed without fatal result in some cases in which hydrops amnii has been mistaken for an ovarian cyst with pregnancy. (See a case reported by Dr. Kidd to the Obstetrical Society of Dublin, *Obstetrical Journal*, December, 1878.) I was, therefore, inclined to recommend an exploratory incision with antiseptic precautions, to be followed by ovariotomy if an ovarian cyst were found to exist.

Three days later the patient was attacked with general abdominal pain accompanied by dyspnœa.

On June 20th I was sent for to see her at home. I found her sitting up in a chair, the dyspnœa preventing her from lying down even at night. The œdema had now extended further over the abdomen, and the skin was reddened on the surface. The legs were also œdematous, and the urine contained a considerable proportion of albumen. There was much abdominal tenderness, and the temperature was 101.3° F., pulse 120. On examination under chloroform fœtal movements were distinctly felt from the vagina. Even under the anæsthetic the finger could not be passed into the cervix, nor could the height of the fundus be made out.

Feeling now pretty certain, from this condition of the cervix, that the case was not one of hydrops amnii, I advised tapping for immediate relief. This operation was performed under carbolic spray the same evening, and twenty-one pints of fluid were drawn off. The fluid was of specific gravity 1007, pale and slightly glutinous, containing a moderate quantity of albumen. Towards the end some soft flaky material escaped through the canula. After removal of the fluid, the fundus of the uterus was found to reach close up to the umbilicus, and the fœtal heart could be heard. The date of pregnancy was estimated at about five months. Judging from the date of the subsequent delivery, it must then have been about seven days short of five calendar months. On microscopic examination of the fluid withdrawn, numerous clusters of cells of irregular shape were found, apparently indicating the existence, in the interior of the cyst, of papilloma with proliferating epithelium, and therefore of a tendency towards malignancy. The patient was much relieved after the tapping; the albuminuria and œdema disappeared, and the febrile symptoms gradually subsided, although tenderness of the abdomen continued for some days. Immediately after the tapping the fœtal movements became at once distinctly perceptible to the patient, and appeared to her to be stronger than was usual at the fifth month of pregnancy.

On July 4th there was found to be again a considerable increase in the distension of the abdomen, and fluctuation was again perceptible over a considerable surface, chiefly toward the upper part of the abdomen. On account of the microscopic characters of the fluid withdrawn at the first tapping and the great activity of the cyst, as shown by the rapid re-accumulation of fluid, I decided to recommend ovariotomy in preference to repeated tappings or the induction of premature labour. It was, however, to be expected that the operation would prove formidable on account of the stage of pregnancy which had been reached, in conjunction with the adhesions which the recent attack of peritonitis had probably left.

I performed the operation under carbolic spray on July 7th, when the patient must have been about ten days advanced in the sixth calendar month of pregnancy. The fundus uteri being felt nearly up to the level of the umbilicus, the incision through the abdominal wall was so made that its lower extremity corresponded with this spot. On tapping the cyst about eight pints of fluid were drawn off. The fluid on this occasion was not pale, but was stained by blood-pigment to a deep reddish-brown. The whole interior of the cyst was covered by papillary growth, and very vascular adhesions were found connecting it with the abdominal walls, the pelvic brim, and the uterus. The attachment, situated on the right side, was very broad, and had to be tied in sections with carbolized silk as closely as possible to the angle of the uterus. On cutting away the tumour, several small cysts, containing soft putty-like material, and covered, like the large cyst, with a papillary growth, were laid open. In order to remove the whole of the papillary surface, it was necessary to cut away the stump with scissors uncomfortably close to the ligatures, less than a quarter of an inch of tissue being left beyond them. After removal of the cyst, great difficulty was found in arresting the bleeding from the very vascular tissue of the uterus and its neighbourhood, and numerous ligatures of fine carbolized silk were applied to the bleeding points. Eventually, as blood was found repeatedly to well up from the right groin, the pedicle, which had retracted deeply, was brought into view again with some difficulty; and, as some oozing was taking place from it, an additional ligature was placed round its whole circumference. No drainage was employed, the abdominal wound being closed by silkworm-gut sutures. The operation had lasted an hour and three-quarters; and, before its conclusion, it proved necessary to replenish the boiler of the steam-spray apparatus which was in use, the wound being, of course, meanwhile suitably protected. In order to avert a miscarriage, if possible, one-third of a grain of acetate of morphia was injected subcutaneously immediately after the operation, and the same dose was repeated three or four times a day for the next few days.

On July 8th the patient appeared in fair condition; the temperature being 98.9° F., pulse 112. The morphia injections produced a considerable feeling of *malaise*, and appeared to cause vomiting. This effect was only slightly mitigated by the subsequent addition of atropine to the injections.

On the 9th the temperature was 97.2° F., pulse 106. No pain was felt in the abdomen, except when the child moved. The patient was chiefly troubled by a swollen face, the result of decayed teeth, the swelling having existed at the time of the operation.

On the 10th there were slight symptoms of peritonitis, the abdomen being painful and tender; and the temperature had risen to 101.2° F., pulse to 120. Next day these symptoms had subsided, the temperature had fallen to 99°, and no threatening of labour occurred. When the sutures were removed on the seventh day, the whole wound was firmly united.

The patient did extremely well until the fifteenth day after the operation, and had already dismissed her nurse, when she was suddenly attacked by phlegmasia dolens of the left leg, accompanied by induration in the course of the femoral vessels from the groin to the popliteal space. There was considerable fever for several weeks, the temperature rising as high as 104° F., and she became much emaciated. No miscarriage, however, occurred. I was absent from England at the time of this illness, and did not see the patient again till September 7th. The swelling of the leg and fever had then subsided, but there was still great stiffness of the thigh and knee, with tenderness and induration in the course of the vessels. From this time she gradually improved, and, during the last month of her pregnancy, had very good health. A living female child was born on October 27th. Labour lasted three days, chiefly through prolongation of the first stage. Mr. Powles was contemplating the application of forceps, but delivery eventually took place naturally. The former labours had been normal. A month after delivery the patient was found to be in fair health. The cicatrix of the abdominal incision was quite firm, and there was no trace of pelvic induration, nor any indication of recurrence of growth in a malignant form. She still remains in good health, except that she has a little pain in the leg, and the baby is doing well.

Microscopic sections of the cyst after removal showed that its internal surface was everywhere covered with villous papillæ. Their epithelial covering was mainly of the columnar type, but was proliferating into tufts of irregular cells easily detached. In many places the papillæ did not project freely into the cyst, but the surface was levelled by a layer of *débris* of blood and cells, similar to that often seen on the surface of a vegetating epithelioma of the cervix uteri. Beneath the papillæ was a layer of gland-like tissue, varying in depth from one-eighth to one-fourth of an inch, and evidently formed by the ingrowth of the depressions between the papillæ. Its histological structure was identical with that of columnar epithelioma, except that it was sharply limited at a very short distance from the surface. The epithelial lining of the glandular acini was mainly of a columnar type, but proliferating irregularly; and in many places the epithelium was growing in the form of prominences into irregularly dilated acini, the cells here being chiefly rounded. The fibrous stroma was infiltrated with nuclei in the immediate neighbourhood only of the glandular tissue. At a few points epithelial cells were seen in the stroma resembling those in the acini immediately adjoining.

Remarks.—The tolerance of the uterus in this patient, notwithstanding the very protracted operation, and the high fever produced by the attack of phlegmasia dolens fourteen days afterwards, appears to be remarkable. It would seem that in most, if not in all, recorded cases in which ovariotomy or similar operations have been performed at a later stage of pregnancy than the fourth or fifth month, premature labour has followed sooner or later. Thus, of the cases recorded by Mr. Spencer Wells in 1877 (*Obst. Trans.*, vol. xix.), in one (Case 6), ovariotomy was performed about the end of the sixth month, labour followed the day after the operation, but the patient recovered; in a second (Case 7), the operation was performed in the sixth month, the fœtus was expelled six hours after the operation, and the patient died; in a third (Case 9), the operation was performed in the sixth month, and the patient recovered, but premature labour came on twenty-five days after the operation. In a case mentioned by Mr. Lawson Tait (*Obst. Trans.*, vol. xix.), ovariotomy was performed in the seventh month, premature labour occurred on the sixth or seventh day, and the patient died a few hours afterwards. In a case recorded by Dr. Wilhelm Baum (*Berliner Klinische Wochenschrift*, 1877), ovariotomy was performed antiseptically about the end of the fifth month of pregnancy, miscarriage followed the day after the operation, and the patient had severe symptoms ending in a pelvic abscess, but ultimately recovered. Again, in the remarkable case of hydatids of the omentum, which simulated an ovarian tumour, and were removed by Mr. Knowsley Thornton in the seventh month of pregnancy, labour came on on the eighth day, the wound having opened after removal of the sutures on the seventh day. The patient ultimately recovered. (*Medical Times and Gazette*, November 16, 1878.) And in a case of fibroid outgrowth from the uterus, also mistaken for an ovarian tumour, and removed by Mr. Knowsley Thornton between the seventh and eighth months of pregnancy, delivery took place on the night after the operation, and the patient died on the fifth day. (*Obst. Trans.*, vol. xxi.)

It is difficult to trace a direct causation for the phlegmasia dolens by which my patient was attacked fifteen days after the operation. If there had been any access of septic material, notwithstanding the carbolic spray, she would not have progressed so favourably for fourteen days after so severe an operation; and if the starting point were inflammation near the pedicle, set up by the presence of the ligatures, it might have been expected that the right leg, and not the left, would have been affected.

Oöphorectomy.

At the recent meeting of the Society of German Naturalists, in the Gynæco-gical Section, Prof. A. HEGAR, of Freiburg, read a paper on what he terms astration, but what is generally known as Battey's operation. He reports forty-wo cases, an unusually large number, but which may be accounted for by his aving many patients sent to him from a distance.

He divides his cases into five groups, the first of which includes thirteen cases, ll of small tumours. He remarks that the line between ovariotomy and castra-on is very hard to draw; the indications and the steps of the operation when e tumour is small resembling very nearly castration. He has, therefore, in-uded all cases where both ovaries were removed, and where they did not exceed billiard-ball in size. The tumours were cystomata, dermoids, parovarian and e so-called tubo-ovarian cysts; both tumours being of the same variety or were combinations. There were some cases of tubo-ovarian cysts, hydrosalpinx with esions of the fimbriæ to the degenerated ovaries. These were all double and plicated with extensive adhesion, and depended on inflammatory process in e pelvis. Other complications in this group were congestion of the uterus d retroversion. As a diagnostic mark between a uterine fibroid and a small arian tumour adherent to the uterus, he proposes a forcible attempt at sepa-tion by the finger in the vagina, in which a sort of fremitus can be appreciated n the yielding adhesions. These cases he considers as extremely difficult, e operation fully equalling an extremely complicated ovariotomy. There re two deaths, one from sepsis and one from incarceration; eight were fully red, and three still complained of pains in the pelvic regions. The second oup included twelve cases of fibromata. The tumours were not very large, t reaching above the umbilicus, excepting one only, which reached great size. e considers castration in the case of very large tumours to be of very doubtful opriety. There were three fatal cases—all septic peritonitis. In six cases the nopause ensued, and the tumours shrivelled. In one case included in the first p, there was a fibroid, which also disappeared. In the case of the large our mentioned, the flow stopped for six months and the patient improved; t, owing to bad surroundings and hard work, it returned, the tumour grew pidly, and the patient died eleven months after the operation. Necropsy owed an enormous fibro-cyst. In the third group there are five cases of so-lled chronic oöphoritis, cystic degeneration of the follicles with changes in the roma, but without any neighbouring inflammation. One death occurred from arceration. In three cases, there was immediate improvement of all the symp-ms. The other case was new, but was improving. In the fourth group there ere five cases where the indication for the operation was uterine disease, such s incurable retroflexion and acute anteflexion. There was one death from ileus. n two cases menopause occurred with improvement of the symptoms, and two ses are quite recent. The fifth group is of particular interest, including cases f chronic recurring pelvic inflammation, such as perimetritis and parametritis with adhesions, salpingitis, and imbedding of the ovary in firm and solid exuda-tions. The symptoms are always severe. There were seven cases; and notwith-standing that the operations were often difficult and long, there were no deaths.

In three cases there was menopause and cure, in one menopause and great i
provement. In another there was a regular typical flow, but great improvem
Two cases were too recent to be judged. The mortality in the cases was o
16.6 per cent. In forty-seven other cases known to the author there is a m
tality of 32 per cent. (The average of total deaths was nearly 25 per cen
Four of the deaths were from septic poisoning, and three from ileus, the stran
lation resulting from adhesions. The results were often disturbed in the beg
ning by symptoms similar to those met with at the menopause. The cases se
to prove the old idea of the dependence of menstruation on ovulation.
twenty-six of the thirty cases, the menopause was complete, in only one c
there was a typical flow, due perhaps to the periodical congestion of a ten
mass of exudation formed around a ligature. Strict antisepsis was used exc
in the first case (fatal), but not according to Lister's method. The spray
considers harmful.

The opening in the abdomen, he considers, has to be made proportionat
larger than in ovariotomy, generally the introduction of two fingers is enou
Great care is needed in putting on the ligature and in closing the abdomi
wound, so as to avoid abscesses.

In the discussion which ensued, Dr. Schröder of Berlin reported two ca
He operates by laparotomy and uses spray, and has seen no bad results from
Dr. Freund of Strasburg reported three operations for myomata, and one
hystero-epilepsy, with one death. Menopause followed in all the cases, and
one only was there no atrophy of the tumour. Dr. von Langenbeck expre
his surprise that absence of the vagina had not been mentioned as an indica
for this operation. He reported one such case. Menstruation occurred
once after the operation. Dr. Martin reported three new cases; two for neu
gia. In one case there was incomplete development of the uterus; both ov
lay on the left. All these cases recovered. Dr. Müller of Bern had oper
three times. In two cases the operation was not completed, as the ovaries w
very adherent. The third case, ovarian neuralgia, was cured. Dr. Czerny
Heidelberg had three cases, one dying of septicæmia. In one case of hyste
with enlarged ovaries, there was no improvement. In the other case (hysteria, w
retroflexion) he had done Kœberlé's operation at the same time. He had a
twice removed the uterus without the ovaries, with the result of stopping all flo
(*Centralblatt für Gynækol.*, No. 20 and 22, 1879.) In No. 20 of the sa
journal, A. Schücking of Harzburg reported another successful case. (See *Am*
Journ. of the Med. Sciences, Jan. 1880, p. 286.) In the *British Medi*
Journal for May 24, 1879, Prof. A. R. Simpson reports a successful case of c
tration, or, as he called it, oöphorectomy. His case was one of dysmenorrh
with ineffectual division of the cervix uteri and pelvic inflammation; "senescenc
followed. After giving the history of his case, he gives a long commentary, wi
a table of thirty-five cases where both ovaries were removed. He gives the cre
of having brought forward and popularized the operation entirely to Dr. Battey,
well as of having independently conceived and performed it. He gives as th
indications, dysmenorrhœa, menorrhagia (from fibroids), amenorrhœa from absen
or atresia of the vagina, and complicated with either threatened insanity, hyste
epilepsy, or convulsions. The mortality in his cases is 37.1 per cent. He pr
fers laparotomy to elytrotomy, and uses carbolized silk ligature, and then cu
the pedicle.

Besides the cases given above, the reporter (*American Archives of Medicin*
has collected a number of cases, some of which have been published and a few ar
new.
